The American railways have several advantages which, to our discredit, have not been introduced upon English lines. Whether the abandonment of all "classes" in railway carriages, the non-distinction into 1st, 2nd, and 3rd classes, whether this be an advantage or not, each reader must determine for himself. We shall simply state, therefore, that such is the case in the United States, and that the passengers—though they have not all the cushioned luxuries of first-class passengers in England—have far more comfort than our second and third-class passengers. The following is the type of an American railway carriage. It is two or three times as long as a London omnibus, but much wider and more commodious; it is divided in three parts at each end, and a row of windows along each side. There is a door at each end, wide enough for one person to walk; and on both sides of this passage are rows of seats, transverse to the length of the carriage, and each accommodating two persons. There are from fifteen to twenty of these seats on each side of the
avenue, thus affording accommodation for sixty or eighty persons in the carriage. The seats are cushioned; and their backs, consisting of a single padded board about six inches broad, are so supported that the passenger may at his pleasure turn them either way, so as to have either his face or his back to the fire. There is a stove at each end of the carriage; and in winter there is a small stove in the middle, with a smoke-pipe projecting through the roof. Some of the carriages have a ladies' compartment at one end. If the horses were very large and racing vehicles were set upon the rails, the speed of the train would be so great that it would be impossible to work them over curves of any but very wide radius; the arrangement adopted is, however, one which renders them even more manageable than our shorter coaches. As the road east of the railway track, on which it rests, is on a pivot; similar to the expedient by which the fore-wheels of an ordinary road-carriage sustain the perch. On a sharp curve, the front truck may be moving in one direction, and the hind truck in a direction a little inclined to it, while the body of the vehicle forms the chord of the arc or curve. These long-bodied carriages have much less dead weight per passenger than English railway carriages. In American towns, the level of the streets, but the passenger stations are in the heart of the town, the carriages being drawn from the suburbs to the centre by horses, along the level of the streets. It should be remembered, however, that in many cases they are laid down as single lines. We have spoken of the railway tunnel; the railway tunnel has recently been introduced in the United States, to excavate tunnels through hard rock. So far as descriptions of it have yet reached this country, it appears as if it would be a very valuable engineering achievement. The machine is essentially the same as that used in building a steam-engine. A rapidly revolving tool bores a hole horizontally in the rock, a few inches in diameter. An enormous vertical wheel, equal in diameter to the intended section of the tunnel, has cutters or tools projecting horizontally from its periphery, and these cut a large circular groove in the rock, concentric with the hole first bored. The central hole is then charged with gunpowder, and a blast loosens and shatters the huge mass of rock between the hole and the groove. If, as is alleged, this machine will tunnel ten feet per day, it will greatly expedite railway works, and cheapen them also.

It is a grand achievement to have the means of locomotion brought to places which were so little time ago quite unknown and even non-existent. It is a great thing to have railways touching out four out of five of the Canadian lakes, and this, too, at many different points; these are yet almost wholly on the south or United States side of the lakes, for reasons before adverted to. It is a fact fraught with important social results, and is publishing itself to the public by the whistle of the locomotive, and that the cotton regions of the south are becoming connected by rail with the manufacturing states of the north. It would be useless to speculate on the probable amount of time saved by the rapid transit of the loco- motive, or the beneficial course which the valley of the great river will take within the scope of a commercial system which our own Stephensons introduced less than a quarter of a century ago. One of the Mississippi railways alone, from Lake Michigan to the mouth of the Ohio, will, when completed, be 700 miles in length.

In Canada a variety of circumstances prevented so early an adoption or so wide an extension of railways as in the United States, by which he had already made so much. The Grand Trunk Railway, 935 miles long, is now open from Portland in Maine, in the United States, to Windsor on the Detroit river. From Portland it crosses a part of New Hampshire and Vermont to Richmond, where a branch process northward to Quebec, 96 miles; the other line goes on to Montreal, a distance from Portland of 292 miles. It is to cross the St. Lawrence by the Victoria tubular bridge which is in course of construction, for a notice of which see in this number. The main line published by the Boston Post in the summer of 1860. Hence the line proceeds west-west- west by Hamilton and Kingston to Toronto, at the head of Lake Ontario, 333 miles; and from Toronto to Stratford and Windsor on the Detroit river, where it connects itself with a portion of the line, not open though nearly completed. The Great Western Railway runs from the Niagara Falls by Hamilton and London to Windsor on the Detroit, 239 miles; and from Hamilton to Toronto, 38 miles. The St. Lawrence is crossed by a suspension bridge of 828 feet span, and 255 feet above the water, available both as a railway and a common roadway, and connects the Great Western with the Rochester and Lockport line. There are also lines running from St. Lawrence to Collingwood on Lake Huron, 75 miles; from London to Port Stanley, 24 miles; and from Prescott to Ottawa, 54 miles. These, though independent lines, form junctions with the two main lines. A third line, parallel with the Great Western, but keeping closer to the river St. Lawrence, overlies and is supplied by the Great Southern Railway, to run from Niagara Falls to the Detroit river at Amherstburg.

In the colony of Victoria a railway has been for some time under construction from Ararat to Ballarat, and is now expected. In Jamaica a railroad was opened from Kingston to Spanish Town in 1846; and upwards of 500 miles of railway have been opened in Cuba. A railway has also been opened from Algiers to Beldia; and a line is in course of construction in Brazil, to run from Pernambuco to San Francisco, both on the eastern coast.

RALEIGH, or RAYLEIGH. [Emxk.]
RAMSBURY. [Wiltshire.]
RAMSEY. [Isle of Man.]
RANA. [Scotland.]
RANGIFER. [Denm.]
RANCIEFS, a genus of Subbranchial Malacocephalans, Fishes, belonging to the family Gadiformes. It has the following characteristics: Face naked; body compressed; dorsal fin, the first very small, the second dorsal and the anal fins elongated; ventral fins small, the first two rays lengthened and separated. R. trachurus, the smelt, or Forked Beard, the Tadpole-Fish. -Pennant describes two species of Rancieps, as belonging to the British Fauna, R. Jago and R. trachurus. Dr. Johnston, of Berwick, was the first to suspect they might be the same fish; and Mr. Jarrett, after comparing Dr. Johnston's specimens with descriptions by Pennant, of the spotted, comes to the conclusion that the two species mentioned by Pennant are one and the same. It is a rare fish; but Mr. Thompson records a specimen as taken in Ireland, and Dr. Farquhar describes it in his 'History of the Fishes of the Firth of Forth.'

RAOUOL-ROCHETTE, Désirée, an eminent French archeologist, was born at St. Armand in the department of Cher, on the 9th of March, 1799. Educated at Bourges, he was called to Paris when little more than twenty-two, to fill the chair of history in the Lyceum; and in 1816 he supplied the place of Guizot as lecturer on Modern History in the University of Paris. In 1815 appeared the work which first gained him a more than local celebrity, 'Histoire Critique de l'ancienne Gaule.' For ten years he continued to publish, but the following year he was made member of the Académie des Inscriptions, and one of the editors of the 'Journal des Savans;' and in 1816 he was appointed keeper of the medals, in the royal academy, and was promoted to the rank of modern Swiss history he, during the following years, made several exploratory journeys in Switzerland, of which he published ample particulars under the title of 'Lettres sur la Suisse écrites en 1819-21,' 3 vols. 8vo, Paris, 1853-56, and 'Voyage Pittoresque dans la Vallée de Chamouni et autour du Mont Blanc,' 4to, 1826. His 'Histoire de la Révolution Helvétique de 1797 à 1803,' appeared in 1823. But whilst thus engaged on topography and modern history, he was still diligently prosecuting the study of classical antiquity, to which he had devoted himself, making various journeys to Greece and Sicily, Italy, Germany, Holland, &c., in order to familiarise himself with particular localities and to examine the treasures collected in museums. In 1829 appeared his 'Antiquités Grecques et Romaines,' and another volume of the same in 1836. From this time M. Raoul-Rochette was one of the most active and most widely known of the French writers on ancient art, communicating numerous papers to the Académie, and contributing to the journals of other learned societies, and frequently appearing before the public in distinct works. In 1826 he published 'Monuments inédits d'Antiquité figurées Grecques, Etrusques, et Romaines,'
BAAS

REC

8 vols., fol. His 'Peintures Antiques inédites' appeared in 1836. In 1839 he was appointed perpetual secretary to the Académie des Beaux Arts, the post previously held by Quatremère de Quincy; and, like his predecessor, he composed a large number of official elegies and resumés. In 1840 appeared his 'Dissertations de l'Académie des Beaux Arts' of 1836 and 1837; and in the same year 'Lettres Archéologiques sur la Peinture des Grecs' and in 1846, 'Choix de Peintures de Pompei.' His last work of importance—one which he describes in the introduction as having for its object 'to direct the investigations of the modern archaeologists towards the most felicitous course which, I believe, will prove fruitful in new discoveries—the relationship between Greece and Asia'—was entitled 'Mémoires d'Archéologie comparée, Asiatique, Grecque, et Étrusque,' but only one part was published (in 1846), and the publisher, Dr. Jean Larousse, who was occupied with the 'Premier Mémoire sur l'Hercule Assyrien et Phénicien considéré dans ses Rapports avec l'Hercule Grec. Except some controversial letters directed to M. Carnot, referring to some charges brought against him in respect of his official conduct, he does not appear to have issued subsequently any separate publications. He died on the 6th of July 1854. An English translation of his 'Lectures on Ancient Art,' by H. M. Westropp, was published in 1854.

RAUCH, CHRISTIAN, an eminent German sculptor, was born at Arolsen in the principality of Waldeck, on the 2nd of January 1777. He early showed an aptness for art, and received instructions in it from the sculptor Professor Rohl of Cassel. In his twenty-seventh year he had been presented to an office in the court of the Queen of Prussia; but his spare hours were all devoted to art. He here secured the friendship of Count Sandreycx with whom he set out in 1794 on a tour through a part of France to Genoa, and thence to Rome. There with the advice and aid of William von Humboldt, then Prussian minister in that city, he devoted himself to the study of the antique, while he availed himself of the friendly instruction of the chief living sculptors, Canova and Thorwaldsen. A due probation he produced several original works, among others, bassi-reliev of 'Hippolitus and Phaedra'; a 'Mars and Venus wounded by Diomedes;' a 'Child praying,' &c. But he continued to distinguish himself by his portraits, in the likeness of which he has continued to owe his chief celebrity, that of portraiture; besides abundant private patronage, he received from the King of Prussia commissions to execute a colossal bust of the King of Prussia, and a life size bust of the queen; and in 1810, the busts of a hero and a heroine, a work of high merit. In 1811 he was recalled to Berlin, to execute a monumental statue of the Queen Louise. His design was approved, and his health having failed, he was permitted to proceed to Carrara to complete the work, which he did in 1812, in a style that secured his reputation. He then went on to Rome, where he remained till 1823, when he returned to Berlin, where he afterwards resided. During his second residence in Rome, Rauch was chiefly engaged on busts and statues; he executed for Emperor Francis, designed for the statue of the king himself, monumental statues of General Bulow and Scharnhorst. By 1834 he had executed with his own hand seventy marble busts, twenty of them being of colossal size. Among the more important of his later works may be mentioned two colossal bronze statues of Field-Marshal Blücher; the first, representing the hero in vehement action, was erected with great solemnity at Breslau, July 9, 1827; the second, designed after Blücher's death, for the King of Prussia, represents the hero on horseback.

Another of his principal works is a seated bronze statue of Maximmilian of Bavaria, erected in 1835 in Munich. The 'Victories' for the Wallahia, near Batasim, are also from his hand. A well-known statue of Ghiberti, modelled from the life, is the greatest work of this great master of modern Germany. Statues in marble or bronze of Schiller, Schleiermacher, and others of his chief contemporaries, and of Luther, Albert Dürer, and other famous Germans of an older time, serve to show the high estimation in which his works are held by his countrymen; while bronze statues of two or three of the old Polish kings, which he executed for Count Raczyński, to be placed in Posen Cathedral, and a bas-relief erected at Dublin in memory of Miss Cooper, show that his ability was appreciated abroad. His chief work, however, is the grand monument of Frederick the Great of Prussia, erected in the finest part of Berlin. This work, in the design of which Rauch was assisted by Professor Schinkel, the architect, and which called into exercise all the resources of modern art, was finished in 1839. The general model was completed in 1838; the colossal model of the king was not however ready till 1842, and the statue was cast in 1845. Four more years were required for the execution of the base-reliefs, and the statue was finally completed in 1850. The work consumed the whole of his life, and of some of the detached statues. The work is a sort of compromise between the severity of classic and the freedom of romantic art, and will not in its details stand the test of criticism. It is only as a whole that the work must be held to be one of the very finest as well as most imposing of recent commemorative works. And we may add that, even without this his master-work, Rauch would unquestionably stand in the highest class of modern portrait and historical sculptors, though not among the first in ideal sculptural. Rauch died Dec. 3, 1857.

RAUPACH, ERNST BENJAMIN SALOMON, one of the most prolific of modern German dramatists, was born at the village of Sariaupit, near Liegnitz, in Silesia, on May 31, 1784. He was educated at the town grammar school of Liegnitz, and in 1801 proceeded to Halle to study theology. He afterwards went to Russia, where for ten years he occupied himself diligently as a teacher, and after a residence, in that capacity at St. Petersburg for a year and a half, was appointed professor of philosophy in the University there, to which in 1818 was added the professorship of German literature. In 1828 he quitted Russia, and having received somewhat later the solicited discharge from his professional duties, he travelled for a time about Germany, visited Italy, and at length returned and settled at Berlin. The result of his journey to Italy appeared in 1823 in "Hirsenwenzel's Briefe aus Italien." His dramatic productions, however, did not meet with much success. He afterwards, though many did not appear in print till long after they had been written. In 1837-38 he published his series of historical plays in illustration of events connected with the Hohenstaufen dynasty of emperors of Germany, which formed the groundwork of his dramatic compositions. His "Dramatische Werke" ("Dramatische Werke ernster Gattung" ("Dramatic Works of the Comic Species"), in 3 vols., 1838-39; and "Dramatische Werke ernster Gattung" ("Dramatic Works of the Serious Species"), in 19 vols., 1830-44). These works display considerable inventive powers, a great command over his materials, a thorough knowledge of stage resources, a sense of fitness, with a happy introduction of interesting situations. In his serious dramas he frequently deviates from established canons; but his comedies and farces, a rich voice of verbal wit. His poetic style is harmonious and natural, and he has consequently been a favourite with the public. His defects are a want of poetic consistency, a weakness of characterisation, and occasionally a lapse again parodied by Gervinus ("Bedeutender Teufel," and one or two others. His series of historical plays on the Hohenstaufen, by provoking a comparison with those of Shakspere, appear the most defective in dramatic execution. Raupach died March 1, 1858.

RAZABILL. [Arm.] RECEPACLE, in Botany, is that part of the flower which any of the other organs rests. It represents the

RAZABILL.
ternodes of the stem and branches in their changed condition. It assumes a variety of forms, and enters very variously into the forms of flowers and fruits. [*Calathidium; Flowers, S. 2; Fruit, S. 2.]*

**RED-BREAST.** [*Erythaca, S. 2.*]

**RED-SANDSTONE.** The term Red-sandstone is more especially applied to two formations, the Old Red-sandstone [*Old Red-sandstone, S. 3.]* and the New Red-sandstone [*Old Red-sandstone, S. 3.*]. The latter are also sometimes called Silurian, on account of the salt they contain, and they are also called Triassic.

It is in Cheshire and the southern part of Lancashire, and the northern part of Shropshire, which together form an extensive and rich plain, watered by the Dee, the Mersey, and the Irwell, that the Old Red-sandstone is chiefly developed; and by a minute examination of these beds, and those of Warwickshire, the saliferous marls have been identified with the uppermost part of the foreign Triassic System. Throughout this range the beds are nearly horizontal, the dip rarely exceeding ten or twelve, and being constantly towards the east, or a few degrees north or south of that point. They are, however, affected by some important faults. The whole district is divided into two divisions, one being very fertile and plentiful in Cheshire; and in that county also there occur extensive masses of rock-salt in a solid state, their total thickness amounting to not less than sixty feet. These alternate with beds of gypseum; with numerous bands of dun-sile, as that of the Esh, the Tanfield, or brown coal; and with sandstones, frequently marly, and of a red colour.

The red-marl district, with brine springs, is continued southward into Worcestershire, and northward into the vale of York, where the circumstances are different, the tendency also eastwards, occupying for the most part the plains through which the Humber and its tributaries make their way to the German Ocean. In Somersetchire and Devonshire similar sandstones recur, and lie unconformably, overlapping, and on top of the gypseum, or being separated against them, but uniformly composed of the same materials, remarkable throughout for the ocheraceous colour pervading them. Between Sidmouth and Seaton, in Devonshire, the red-sandstone contains quartz-particle of Silurian rocks and old red-sandstone. The total thickness of this part of the formation is considerable, but has not been accurately calculated. It is only to be distinguished from the overlying saliferous marls by small differences of mineral character. (Austed.)

Viewed on the great scale, the New Red-sandstone of England consists of three of the most varied and interesting we are acquainted with. There are peculiarities in its limestones, its sandstones, and its clays, as well as in its gypseum and salt deposits; the occurrence and nature of its organic contents, and the relation which it bears together to earlier and later classes of rocks, are worthy of careful study.

Sulphate of lime is found perhaps as frequently, and under almost as many curious circumstances in the stratified rocks as in the gypseum. It occurs in the form of prismatic, broad-foliated crystals (selinite), fibrous masses and beds, and marmoird or alabasterine rocks. It lies in strata of almost every age, and is not absent from diluvial, alluvial, and recent deposits. The mode of its occurrence is in a considerable degree characteristic of each particular mineral type. While long prismatic crystals appear in cavities of shells and in recent excavations (as in the gallery of Felling Colliery, Newcastle), the solitary broad flaky crystals appear in the tertiary period, and the secondary series (which receive their colour from protokidite of iron), and the fibrous gypseum marks, spots, and irregular lines in the red-clays (coloured by peroxide) of the Silurian System, the fibres being in agreement with a general law of stratification, and appearing at the surface or in the internal surfaces which bound the mass. The marmoird texture is most commonly found in real however irregular beds, as at Montmartre, and in some points near Fairburn in Yorkshire, on the line of the York and North-Midland Railway. At these places fibrous, marmoird, and flaky sulphate of lime may be obtained in association.

From what is known to take place at the present day, and from appearances in the distribution of the gypseum and redder sandstones, the clayey masses of clay and cavities of shells, &c., it appears that the redder sandstones, and the fibrous gypseum which appear in red-marl at Arnmouth, Ault Passage, and the Trent's mouth could be formed. The marls in which they here lie were deposited as fine mud, and if we suppose merely a slow extraction of the liquid, so that its contained salts might remain, the arrangement of these salt-bearing strata has taken place during crystallisation presents no particular difficulty.

Salt shows itself in the Cheshire mines, as either granular, broadly laminated, or fibrous; in great beds or minutely mixed with marls, and nearly as gypseum is, and probably in regard to its origin, similar suppositions will apply, the solid beds (of limited extent, however, and irregular area) being due to a great evaporation of liquid over the previously deposited marls. That such water, in the case of rock-salt, may have been generally the original source of the fibrous salts, or of the occurrence of iodine and bromine in the brine springs connected with them. (Daubeny's Memoir in *Phil. Trans.)* But it does not follow that the area in which the salt was formed was, at the time of its formation, or for some time previously or subsequently, a sea or sea-like, or even a continuous body of water. It may have been the theatre of the evaporation supposed, and the salt-sediments, such as occur in Cheshire and Poland, may have been drifted in by fresh waters or the sea, according to the parallelism of the processes, the occurrence of iodine and bromine in the brine springs, and the occurrence of the two great beds of rock-salt in Cheshire. It is not known that organic remains of any kind accompany the salt of Cheshire, but this is almost true of the whole range of the red-marls, in which these deposits are found.

We find, then, associated together, abundance of red-oxide of iron, salt, and gypseum, but few or no organic remains. The prevalence of red-oxide of iron in any of the strata is accompanied by a scarcity or total absence of organic remains. In the new red-sandstone these red strata extend through several hundred feet of thickness, and it is found in general terms, that the types of organic life above and below are widely different. Similarly the thick series of old sandstones contains two distinct groups of these productions. Some geologists believe that if the strata pass uninterrupted upwards, we should be able to trace the fossiliferous strata of the Permian towards the south, the Carboniferous towards the north, and the Jurassic towards the east and west. (Cuvier.)

M. Adolphe Bronnemar (*Fossilies de la France,* 1839), comparing the series of fossil plants, gives four great periods of ancient vegetation:—The first extending from the earliest strata to the new red-sandstone strata; the second including these strata; the third including the oolites and chalk; the fourth the tertiary strata. Of these the flora of the second period (chiefly terrestrial) is very limited, and may be looked upon as a transition group of plants connecting the earlier and later periods. Similarly the series of marine Invertebrates which lie in the new red-sandstone have characters intermediate between the early (paleozoic) and later races of pre-Adamitic life.

Although the fossils of this rock are but few, they are highly interesting to the geologist and naturalist, being the first traces of an air-breathing animal. This creature, which was at first called *Chirotherium,* is now known under the name of *Lepidobranchia.* It belongs to the amphibious tribe of Reptiles. Footmarks of an extinct reptile have also been found in the red-sandstone of America, and described by Dr. Lea.

The equivalents of the British beds of the new red-sandstone on the continent of Europe are—*the Kaup Marls,* or *Marres des Bayeux,* the *Bunter Sandstein,* or *Grès Bigarre,* of Germany and France.

**REDPOLE.** [*Irenet.*]

**REDSCHID PASCHA, OF MUSTAPHA RESCHID PASCHA, was the son of parents in rather affluent circumstances, and was born at Tunis in the year 1800. He was the eldest of a family of eight, and his brother-in-law, Ali Pasha, attached him to his person, and employed him in the Mores and Brousse during his government of those two provinces. In 1826, when the
insurrection broke out in the Morea, Redchisd served in the campaign against the insurgents. After the death of Ali Pasha he transferred his services to Selim Pasha, who made him his private secretary in 1839. He now began his preparation for the higher offices of state by a series of foreign missions. In 1831 he was sent as envoy to Mehemet Ali, viceroy of Egypt, with instructions to act as a negotiator in the preparatory treaty of Kutahia in 1833, he was in the following year raised to the dignity of Pasha. In the course of 1834 he was sent on a mission to the courts of London and Paris. Nearly two years were thus occupied, and the relations he formed with the leading statesmen, diplomatists, and party leaders in England and France, became the basis of the credit and influence he obtained on his return to his native country. The great measure of Parliamentary Reform had recently become the business of the House of Commons. Redchisd Pasha’s name was proposed as a candidate for the University of Oxford, in order to have an occasion to apply, on a professional subject, to the late (John, first) Earl of Morley, who, discovering the latent talents of the young engineer, took scarcely twenty-three years of age, and after the completion of the large bridge of the Lycus, an arm of the sea within the harbour of Plymouth, over which his lordship was proprietor of an ancient ferry, for which it was desirable to substitute a bridge, the south bank of the river Medway, on the completion of the large bridge, consisting of five elliptical arches, was, with the exception of that of Southwark, the largest cast-iron structure of the kind in the kingdom. Mr. Rendel was engaged in its construction from 1824 to 1827. For his account of this work the Telford medal of the Institution of Civil Engineers was awarded to him. About this period he designed and executed the Boucombe bridge, where hydraulic power was for the first time applied to the machinery for working swing bridges. Soon after the completion of the large bridge of the Lycus, Mr. Rendel settled in Plymouth, and there exercised his profession with great activity, being engaged in surveys and reporting upon nearly all the harbours in the south-west of England, and executing the works at a great number of places, acquiring that mastery over hydraulic engineering on which his fame will chiefly rest. In 1831 he introduced a new system of crossing rivers by means of floating bridges worked by steam power; they were applied at Saltash and at Torpoint on the river Tamar. The rapid progress of the railway system prevented the further development of this useful invention, for which the Telford medal was awarded. Descriptions of the structure of these bridges, as well as of that of the Lycus, are given in the page of ‘Transactions of the Institution of Civil Engineers.’ Particulars of the construction of the latter were also communicated by Mr. Rendel, in 1839, to the Plymouth Institution, of which he was a member, and published in the following year in the only volume that has hitherto appeared of its ‘Transactions.’ The repairs of the Montrose suspension bridge, after its fall, were confided to him, and he there introduced the system of imparting that rigidity to the platform of the road way which is now so extensively adopted. In 1838 Mr. Rendel removed to London, where he was soon consulted upon many important works, and was engaged in the chief parliamentary contests of that remarkable period in the history of the railways. At the time of the opening of the line from Millbourn and Portsmouth; but the rapid progress of the railway system prevented the further development of this useful invention, for which the Telford medal was awarded. Descriptions of the structure of these bridges, as well as of that of the Lycus, are given in the page of ‘Transactions of the Institution of Civil Engineers.’ Particulars of the construction of the latter were also communicated by Mr. Rendel, in 1839, to the Plymouth Institution, of which he was a member, and published in the following year in the only volume that has hitherto appeared of its ‘Transactions.’ The repairs of the Montrose suspension bridge, after its fall, were confided to him, and he there introduced the system of imparting that rigidity to the platform of the road way which is now so extensively adopted. In 1838 Mr. Rendel removed to London, where he was soon consulted upon many important works, and was engaged in the chief parliamentary contests of that remarkable period in the history of the railways. At the time of the opening of the line from Millbourn and Portsmouth; but the rapid progress of the railway system prevented the further development of this useful invention, for which the Telford medal was awarded. collected, forms a valuable record of the state of engineering practice. The most incessant labor, and the mental anxiety inseparable from this undertaking, were more than ever felt, and required the most rigid self-control, and it is feared that they tended to shorten his life.

The daring project of constructing a dock at Great Grimsby, by projecting the works far out on the mud-banks of the Humber, was commenced in 1834. The grandeur of the scheme, the magnitude of the undertaking, the cost, and magnitude of the materials, and the success of the two great works which alone suffice to hang down his name to posterity besides those of Smollett, Rennie, and Telford,—the harbours of Refuge of Holyhead and Portland. Both these works were conceived with the largest views, and both were executed under the personal superintendence of Mr. Rendel, who, from the first, system was adopted of establishing timber stages over the line of the jetties and depositing the large and small stones together, as they came from the quarries, by dropping them vertically from railway wagons into their positions, thus bringing up the mass simultaneously to above the level of the sea. These two great works are advancing very satisfactorily; and it is worthy of remark, in evidence of the engineer's sagacity in the adoption of this system, although the severe storms which have repeatedly occurred on the exposed coasts where they are situated, have done some injury to portions of the stages, and of the temporary works, at Holyhead—where the piles were not shod with Mitchell's screws, which proved so successful at Portland—not a stone would appear to be lost, and the success of the system may be said to be complete, in spite of the sinister predictions which prevailed before it was tried. Amongst the other works upon which Mr. Rendel was engaged, should be particularly noticed the establishment of the military station and the improvements of the Nepean River. He was also employed by the Exchequer Loan Commissioners to report upon the drainage and other public works in Ireland.

He was less engaged in railways than hydraulic works; but in England he executed the Kirkendall, Lancashire, and Cheshire Junction Line, and he had the direction of the 'East Indian' and the 'Madras' railways in India, the former projected by Mr. (now Sir Rowland) Macdonald Stevenson, as the first of the vast system now in progress, which will connect the three mystery courts, the defendant being permitted to remove the cause from the latter, but to lose his cause unless he proves that the title in dispute, or the rent or damage in respect of which the distress was taken exceeded 8d. in the shilling; a practice confined to reprieves of distresses taken for rent in arrear or damage feasant: but the restriction is practically needless, for the other species of distresses known to the law have long been abolished.

REPRODUCTION IN PLANTS AND ANIMALS. The term Reproduction has been employed to denote those processes in organic beings by which the individual being is produced, developed, and maintained. It has thus been employed to express processes which were functionally distinct, and have very different ends in the economy of creation. The constant reproduction of the same tissues in the same part, is the means by which the form of the individual being is maintained during its life, and is the result of the ordinary processes of the organism. This form of reproduction is possessed even to the restoration of a lost limb amongst the lower animals, no such power is possessed by the highest.

The term Reproduction has also been applied to the origin of the germ from which individual plants and animals grow. The process employed in the initiation of life seems to be essentially distinct from those engaged in carrying it on: hence the propriety of distinguishing in terms between that production of cells by which the life of the individual is maintained, and the arrangements by which its existence as an individual is ensured. It has once been proposed to restrict the term Generation to the latter process.

Although formerly great difficulties existed in distinguishing between these two processes from the want of sufficient observations, recent researches seem to have supplied all that is necessary. In the ordinary reproduction of the tissues of plants and animals each cell has the power of producing other cells, or a large number of the same kind of cells are developed simultaneously, but in generation it is necessary that two cells should take part. At one time it was supposed that this process did not take place in the generation of the lower animals and plants, but recent investigations have shown that the union of two cells is necessary to so large a number of cases that it is a fair inference that this is a universal necessity in the generation of organic beings. The two cells thus engaged have been called the germ-cell and the sperm-cell. The germ-cell is that in which the process of growth of the new being commences, whilst the sperm-cell is that which communicates the growing tendency to the other. These cells...
of different sizes and forms in the animal and vegetable kingdoms, and no proof is adduced in any particular case in relation to organic beings, and the means by which they are brought together are very various, but in all cases they perform the same fundamental function.

The discovery of the necessity of the union of these two cells was an event of importance in the history of a science, and has gone far to settle the question of 'equivocal' or 'spontaneous generation.' Ever since the extended use of the microscope in the investigation of the structure of the organic beings, it has become more and more apparent that there was no basis for the supposed production of organic beings from inorganic substances, independently of the aid of a preceding organism. The only cases in which it is now pretended that such an origin of organic life could take place, are those in which the smaller forms of animal and vegetable life are supposed to be produced under ordinary atmospheric conditions. By the time the occurrence appears of easy explanation, when it is remembered how exceedingly minute many of these organisms are, and that they are frequently produced from ova much smaller than themselves. Such organisms are easily taken up into the atmosphere, and can be thus conveyed from one spot to another. That such is the fact is proved by the experiment of passing atmospheric air through red hot tongs or strong sulphuric acid, when it is found that water exposed to such air, if it be not already contaminated by organic beings, whilst the smaller water exposed to ordinary atmospheric air will, in a few hours, teem with living beings.

Although the subject of the generation of animals and plants has been regarded as a subject of much mystery, the facts now before us as well as any part of one branch of physiological inquiry. The greatest mystery is the mystery of all nature, and that is the reason of the assumption of a particular form by what appears to be the same combination of elements. No difference can be discerned between the cells of the flowers and the leaves, and the oak and the thistle; but the one always produces oak-trees, whilst the others always produce apple-trees. It is the same with the cells of animals, without the slightest appreciable external difference; the one set of cells will develop the form of one species of animal, and another set, another species. This fact has led some inquirers to the assumption of the existence of a 'vital principle,' of a distinct and independent essence, giving to each species its definite form and character. There is no objection to such an hypothesis, provided it is not made use of to explain phenomena which are clearly under the influence of chemical and physical forces. As so much misunderstanding prevails with regard to the word 'vital principle,' it is better perhaps to discard it, and to speak of the limitation of form to which each species is subject, as under the control of a 'formative force.' This formative force being the ultimate fact in the history of each individual plant and animal, and regulating the chemical and physical processes of development, is usually supposed to call this a germ-force, or a germinal capacity; but it is very clear that it is the same force that is in action to produce the whole life or growth of the plant or animal, and not for distinguishing its first effects, as observed in the act of generation.

In studying, then, the phenomena of generation, there are three conditions which have to be regarded.

Firstly, the Formative Force, which is peculiar in every species, and identical in all the generative cells produced in that species.

Secondly, the Physical Conditions in which the generative cells are placed. These are more especially heat and light, and the condition of the cell-membrane through which absorption takes place.

Thirdly, the Elements which are supplied for the nourishment of the new being, and which by their Chemical Properties are capable of exercising an influence on the form and development of the plant or animal.

Each of these circumstances is found exercising varying degrees of influence in plants and animals. Thus, amongst the lower forms of both the animal and vegetable kingdom, the formative force appears to exercise less influence than amongst the higher forms, when in the latter the same species of plant and animal assume under different circumstances. In fact, till very recently, many of the forms of Fungi, Algae, and Infusorial Animals, to which was ascribed the power of reproducing itself by its own nature, were found to be influenced by the third set of circumstances. The highest animals and plants are however liable to great modifications of the activity of the formative force by the operation of both physical and chemical circumstances. Many insects are not hatched till a certain amount of external temperature takes place. Plants will not produce their leaves without the influence of light. Tadpoles are not developed into frogs and toads when deprived of light and heat. The well-known experiment of placing a mouse in a room of 90 degrees of Fahrenheit's, the temperature of the animal being too high for it to live there, and on the subsequent removal of the animal to a room of 50 degrees of Fahrenheit's, the mouse became so chilled that it died; and yet in不到 45 minutes it became warm and lively again. The Brassociz pricina of the sea-shore is converted into red and white cabbages, cauliflowers, and broccoli, by garden culture. All cultivated plants exhibit more or less modifications of their form in consequence of the influence of physical and chemical circumstances. The dog, the pig, the horse, and man himself, present varieties which are manifestly dependent on external circumstances, and not on any change in the character of the formative or species-making principle. It is seen therefore that there is no change in the character of the species; there is a tendency in the tendency of the characters of the species; and it is seen especially in the case of cultivated plants and domesticated animals, which are subject to the greatest varieties of form, but which nevertheless retain through all, the evidence of a specific formative force. Thus, closely allied as are the species of apple and pear (the Pyrus malus and Pyrus communis), there are such great varieties of form that a thousand thousands of apple have been produced in Great Britain alone, there is not the slightest tendency in any of these cases towards confounding the specific character of the apple-tree and the pear-tree.

In what is called the alternation of generations [Generations, Alternation of, S. 3], it might be supposed that an exception is made to this law. It will be seen however that in all the cases in which this phenomenon occurs, it results from modifications of the ordinary processes of reproduction, and the unusual disposition of the sperm-cells and egg-cells.

Having made these general remarks, we shall now proceed to speak more particularly of the process of generation as it occurs in plants and animals, restricting this term to the phenomena which take place as the result of the union of two cells. That reproduction in plants which occurs as the result of the growth of the same tissues from single cells, when it results in the production of a bud, is termed Gemmation or Sprouting. This kind of reproduction also takes place in the animal kingdom, and amongst many of the lower animals, from which it is known that the process of budding is seen. To this process of forming new beings as it were, from single cells, Professor Braun of Berlin has applied the term 'Verjüngung,' which has been translated by some into the term 'rejuvenescence' in this country.

Amongst plants the lowest position is assigned to the families Diatomaceae and Desmidiaceae, and it is amongst these that the most clear evidence has been obtained of the union of the cells in order to the production of the zoospores from which the new beings are developed. [Diatomaceae, S. 3; Diatomaceae, S. 3.]

The union of two cells is also seen in a large number of Conferenaceae, especially in the groups to which the Eugenolata belong. [Zonaria.]

Although amongst the Algae the production of spores be treated as the rule, and the number of connected cells in the process of budding is seen. To this process of forming new beings as it were, from single cells, Professor Braun of Berlin has applied the term 'Verjüngung,' which has been translated by some into the term 'rejuvenescence' in this country.

In the Fungi we meet with a variety of reproductive organs. At these have been investigated very recently, we give the following extract from Dr. Sanderson's account of the vegetable ovum in the 'Cyclopedia of Anatomy and Physiology.'

The simplest form of reproductive organs in the Fungi are those in which the spores occur on a basis or basidium.
This form of organ is best seen in Geaster. The next form of reproductive organs in the Fungi is in the form of a vesicle or bag, which is called a theca, or ascus. "Of these, the first which we shall mention belong to a group of subterranean plants, of which the Truffle is the best known example. The vesicle and its contents are usually perfect throughout which numerous sinuous cavities are intercrossed. Each cavity is partly lined, partly filled with the theca and the cells upon which they are supported. This receptacle, like the others, which are all of similar structure, originates from a pre-existing mycelium. In its unripe condition it displays, on section a number of sinuous empty cavities, which, during communication with each other, or open at one or more points of the external surface. As the Truffle approaches perfection there is complete separation between the contents of the young whitish mass to show that, on section, we observe the whole to consist of two substances—the one translucent, of firm consistency, and of a dark-brown colour; the other white and opaque. The former, which corresponds to the partitions which, in the young state of the Truffle, separate the cavities, is continuous with the external tissue which composes the envelope or peridium, and constitutes the venae isernia of Vittadini. The lamina which it forms consists of fine fibres, somewhat elastic, for the sake of its support. The white substance which occupies the original cavities of the tuber is formed of closed tubes, which are given off in great numbers from the surfaces of the lamina. These tubes, which are the terminations of the filaments of which the lamina is formed in the manner described, vary in diameter throughout, and divided at intervals by septa; others much shorter are dilated at their extremities, and contain spores (thecae). Each theca is an oblong vesicle, and contains two, three, or more spores, never as than eight, divided by concave or convex septa, and sometimes large, others very small, or sometimes warty saccus, within which may be distinguished a smooth inner membrane, immediately enclosing the oospore and its contents. The ascomycetes Fungi are represented in their simplest form by the Uredinae, a family which has been studied by numerous observers on account of the destructive properties of the plants belonging to it. The mass which is formed by the growth of the reproductive organs of Uredo under the epidermis of the leaves of the plants upon which it grows parasitically, may be aptly compared to a pustule, a grumous-looking substance, occupying, as it were, the place of the pus. On more minute examination of the cavity, we find that it is bounded by a kind of irregular wall, and lining of peridium cells, the smaller ends of which rest upon a peculiar cushion of mycelium. These are probably the enlarged extremities of the mycelium filaments, with which many of them can be distinctly traced to be connected. Towards the base of the cavity, but not in the immediate vicinity of it, we can see numerous septa mentioned in their general form, as well as in their relation to the mycelium. In these however the membrane is produced inferiorly, so as to form a tabular pedicle; while in the club-shaped upper extremity it is lined by a considerable deposit of granular protoplasm so that here the external cavity is very much smaller than that of the external membrane. It is in this cavity that the spore is formed, at first not exceeding in size, but afterwards increasing at the expense of the protoplasm, so as almost to fill the theca. In other genera, as in Phragmidium, there are pedicled cells of a similar form, and originating in a similar manner, which, however, instead of one spore, develop another in their interior; these spores are arranged in linear series, and are formed in an accrescent capillary sheath, with three or four. One appears completely, but remains as a more or less constant membrane, giving the ripe spore to the spore-case which encloses it. Some of the Uredinae possess a cyst which remains unna of the periphery of the Sphaeria, to which they are evidently closely related. The cyst is formed (Ecdiium) of a single layer of roundish cells.

From the Uredinae we pass by a natural transition to the Discomycetes and Pyrenomycetes. These plants have been investigated with a microscope, and it has been shown that they possess the closest relationship not only to the Lichens but to the most simple thread Fungi. The very remarkable facts which these observers have discovered, render this at once more important and instructive than that of any other family of the class. The Pyrenomycetes are represented by Sphaeria, the receptacle of which consists, as is well known, of a spherical cyst, which is open above. Its wall is frequently prolonged upwards into a tabular beak, which projects beyond the surface of the bark or wood in which the whole plant is imbedded. The membrane of the cyst (perithecium) is usually composed of polygonal tubular cells; it is lined by an inner layer, formed of the commencements of the paraphyses and the spores of the first order, which are connected. The theca is oblate cells, the membrane of which is of extreme delicacy. When fully formed, they contain from three to eight oval spores, the epispores of which are very delicate and pellucid, but by degrees become brown and opaque. The eusporal spores, as it is observed throughout the higher Fungi, consist of a fluid loaded with oily granules. The theca are arranged with their long axes perpendicular to the inner surface of the perithecium, and the spores placed below the thecae with a greater or less number of slender cylindrical paraphyses. The whole perithecium is usually enveloped in the filamentous stromata or mycelium, from which it takes its origin. The Discomycetes are represented by the Pezizae; between these and the Sphaeria there are differences of external form, which, though they strike the superficial observer as important, are in reality trivial. While the receptacle of the Spharia is a cyst with an open aperture, that of the Peziza is more or less tubular, the opening of which looks upwards. This surface is lined with an ascomycete membrane, which resembles in every respect that of a Spharia.

Along with the Peziza and Spharia, and those allied genera which resemble them in producing their spores enclosed in a cup, we consider the Pyrenomycetes and Discomycetes, which, while they resemble those last named in the general outline and structure of their receptacles, differ from them completely in the mode of origin of the spores. The simultaneous occurrence in some of these forms of both mycelium and hymenial paraphyses, or, in other instances, the successive development of both kinds of receptacles in the same position, had been frequently observed, and had given rise in the minds of some mycologists to the suspicion of the existence of a relation more close than was generally admitted. This suspicion did not, however, take a sufficiently distinct form to lead to observation, until the Messrs. Tulane, in a series of researches scarcely completed, showed that the genera in question, hitherto considered as distinct, were in fact identical, and that receptacles containing thecae and paraphyses, are produced on the same stroma, or, in other words, on the same individual plant, as those which contain acrogenous spores. The earliest researches of Messrs. Tulane were directed to the Pyrenomycetes. In some species of Spharia, they found not only that the same stroma produces receptacles with acrogenous spores, which are followed by others bearing paraphyses, but that in some cases the stroma returns to form spore-bearing organs of a much simpler character; namely, branching filamentous pedicles, bearing at their terminations single spores, and rising directly from the mycelium filaments, with which they are continuous. In this condition the plant cannot be distinguished from a thread fungus, and has been hitherto described as such.

The later observations of Messrs. Tulane, which are much more in detail, refer almost entirely to Discomycetes. In a species of Bhystinae, a genus of Discomycetes, which inhabits the epidermis of the leaves of plants, the stroma at first presents the appearance of a black spot of various extent on the surface of the leaf. In the substance of this stroma the first receptacles are formed; they are cushion-shaped, and their spores are produced within the cavity of the Spharia, and are entirely occupied by a pulpy nucleus, which consists of slender branched filaments, of small size as to project considerably beyond the aperture. These filaments bear at their extremities minute linear spores, which are enveloped in an abundant mucilage, and are expelled from the ripe capsules in the form of a long cirrhus. After the capsules, which are developed during the early summer months, have discharged their contents, the stroma is replaced by a perfectly perfect Bhystina. These do not arise at maturity until the following spring, and bear upon their upper surface theca and paraphyses, like those of a Peziza. In other genera to Tulane's researches, the ascomycete receptacles are preceded by capsules, which precede instead of the linear spores above mentioned, cylindrical spores of a much larger size, each of which is supposed to be the extremity of a pedicle of its own.
Thus in the plants under consideration we find that, without crossing the spores which are produced by filamentous threads directly from the stromata, there are no less than three varieties of sporé-like structures, which can be easily distinguished from each other. All of these may be produced upon the same individual, and one is recorded in which there are filaments bearing the spores, and forming the normal thcme, paraphyses with innumerable slender linear sporules at their extremities. As has been already hinted, the capsules which contain acrogenous spores, have been hitherto considered as belonging to a distinct and entirely different class represented by the ascocarpous receptacles with which they were found associated. The genus Cryptopus is characterized by a structure which corresponds completely with that of the capsules described above in Myosotis; and other genera, of the acrogenous sporulæ, have a similar relation to the capsules, containing the larger variety of pedunculated cylindrical spores.

We know less of the reproductive organs of the Lichens; they however closely resemble those of the Fungi. The following is a summary of the reproductive organs found in these two orders:—I. Sporules which are formed by the constriction and separation of the extremity of a simple cylindrical filament. 2. Spermatozoids, with their supporting pedicles. 3. the asci or ascides, with filaments, or sacculi, Basidia, with their basidio-sporæ. Although the evidence is as yet imperfect, there is still good reason for supposing that the asci and spermata are truly sperm-cells and germ-cells, whilst the other organs represent the germ or buds.

The Vascular Cryptopus, or Cryptopus, is given under the articles Floris, S, 2, and Musc. That the organs there described may be regarded as containing the two elementary cells, which we have called germ-cells and sperm-cells, is now matter of little speculation. Mr. Henfrey in a report made to the British Association in 1851, says, in regard to the question of sexes,—"We have several kinds of evidence:

1. The inferences to be deduced from the universality of the existence of these two kinds of organs in concomitance with the reproductive process. We have seen that these exist in all the families at some period or other of the life of the representative of the species. In the Mosses and the Hepaticæ they occur in the full course of the plant. In the Ferns and Equisetæ they occur upon cellular structures of frondose character developed from all the spores, which frondose bodies or pro-embryos have an existence of some permanence, especially in the Equisetæ. In the Lycopodiaceæ, the Isoetaceæ, and the Ricciaceæ, the pistillata occur upon very transitory cellular structures produced from one kind of spore, the larger, whilst the smaller spores at once develop in their interior cells containing moving spiral filaments, and which occur in the antheridia of the other families.

2. The inferences to be deduced from the observations on the development of those plants in which the two kinds of organs, occurring in distinct places, can be separated. Strong evidence has been brought forward that the diocious Mosses and Hepaticæ do not parallel the sex of the plant; and the whole of the antheridia are kept apart from the antheridia by natural accident. The majority of observers state that the large spores of the Ricciaceæ do not germinate if the small spores are all removed from contact with them; a few counter-staements have been made. Again, the majority of authors, and all the recent ones, state that only the large spores of the Lycopodiaceæ and Isoetaceæ produce new plants; while some older writers believed that they had seen occasional exceptions.

3. The direct observation of a process of fertilization, of which we have only testimony from two authors, Sarninski and Mercklin, in reference to the Fern alone; since the observations of Schleiden in regard to the Ricciaceæ have been demonstrated by Nägeli, Hofmeister, and Mettenius to have been based on very imperfect observations." To the question as to the homologies of the organs in the higher Cryptopus, Professor Henfrey gives the following answer:

"In the Mosses and Hepaticæ the pistillata occur upon the plant when the vegetative structure is perfect, and the immediate product of the great cell is a sporangium. If a process of fertilization take place here, we may regard the antheridium as analogous to the pistillate flowers of flowering plants, the sporangia of their fruits; or with Hofmeister we may regard the phenomenon as an instance of an 'alternation of generations,' where the pistillata would be looked upon as an ovule producing (in the sporangium) a new individual of totally different character from that developed from the spore (the leafy Moss plant in the usual acceptance of the term).

In the Ferns and Equisetæ, we find the spores producing a frondose structure of definite form, upon which are developed the spore-bearing organs; and it is here we seem to have one generation complete, and the new development from the pistillidium or ovule appears in a totally new form, producing stem and leaves which have a distinct individual form and existence. We may therefore describe the spores after a long period upon temporary parts of the structure, on the leaves; and by no means cease to exist when those are matured. Here we seem to have a real 'alternation of generation,' and Hofmeister compares the whole permanent plant to a sporangium, and the pistillată to the ovule of Mosses and Hepaticæ. In all the other families, the Lycopodiaceæ, Isoetaceæ, the Ricciaceæ, the pro-embryo is a very transitory production, and is developed from a different spore from the spore-sporules. This pro-embryo is in analogies to that of the Ferns and Equisetæ; and if the existence of sexes be a fact, we have here a diencephalic condition as contrasted with a monoeocious condition in the two last-named families. Hofmeister here again assumes that these pro-embryos are intermediate generation between the two perfect forms of the plant.

It is rather difficult to decide upon the real analogies of these structures with those of the flowering plants. This is more especially the case with the Hepaticæ and Mosses; and, in the case of the Vascular Cryptopus, that they must be regarded as analogues, and then the former could not well be conceived to be analogous to the spore-sporules of the flowering plant; but neither is this the case of the ovules; if this be the case, the sporangium must be considered the analogue of the perfect plant in the Fern, &c., and the leafy stem as the analogue of the pro-embryo of the Fern, &c. The pistillidium of the Mosses can indeed be compared to the ovule of the flowering plant, in that case the spores would be ovules produced long after fertilization; and on the other hand, if we consider the pistillidium of the Moss as an ovule, which it might be, analogous to the leaf of the flowering plant, in that case a large number of embryonal vesicles or rudiments of embryos are produced after fertilization on the branched extremities of the suspenders—then we seem to lose the analogy between the product of the pistillidium of the Moss and that of the ovule of the Fern, unless we would regard the entire plant of a perfect Fern as analogous to the ovule of a Conifer.

We close this part of our subject with a tabular view (given in the next page), of the analogies in the development of different classes of plants, drawn up by Dr. Sanderson.

The process of generation is much more clearly apprehended in the flowering plants. Here we have two sets of organs whose functions are clearly and definitely the production of the flower and of the seed. The flower is composed of a number of cells, and the germ-cells are prepared as the Pistil, whilst the Stamen, in that part of its structure called the Anther, elaborates the sperm-cells. In the pistill the germ-cells are called Ovule, or Seed-Buds; whilst in the anther the sperm-cells are called Pollen, or Pollen-Grains. In the growth and development of both these sets of organs great differences are observed, but their function is always the same.

The history of the development of the ovule of Orchis Mortonia will serve us as an example of the flowering plants. In this plant the ovule springs from a placental surface as a single projecting cell, which by subdivision forms at last a central cell called the nucleus, and this becomes surrounded by a layer of cells. This nucleus, or central cell, becomes the embryonic germ-cells. The pollen-cells from the anthers having fallen on the stigma, now pass down the passage of the style, and at last, through a little opening in the ovule called the micropyle, come in contact with the central cell inside of the ovule. Within the embryo-sac are to be observed at this time three small cells called embryonal vesicles. "Soon after the pollen-cell has reached the embryo-sac, one of the embryonal vesicles begins to enlarge, and becomes divided by a cross wall into two parts, the egg- and the polar region, and ultimately in a filamentous form through the micropyle by a continued process of cell-division, the lower cell enlarges and divides repeatedly, so as to become a cellular globule." (Henfrey.)
This is the embryo. The prolonged part subsequently dies away.

The development of the pollen-cell is more uniform in the different families of plants. The part of the stamen called the anther at first appears in the young flower-bud as a little cellular papilla. In process of time this papilla divides into two portions. These are the rudiments of the future loculi, or valves. In each half, a single axial vertical column of cells soon becomes distinguished by their greater size and granular contents. In each of these cells the nucleus disappears, and is replaced by two others; this being followed by a division of the cell-contents, which form the primordial circle, into a new cell round each nucleus. This process is repeated, and a mass of cells is thus formed which become the parents of the true sperm-cell or pollen-grains.

The walls of these parent cells now become thickened, their nuclei disappear, but are replaced by four permanent nuclei, which become each invested with a primordial sac. In this manner each of the parent cells is divided into four compartments. A cellulose intumescence is afterwards formed over each compartment, which now become the pollen-grains. Like the nucleus or embryo-sac of the ovule, these pollen-grains have no further power of independent development or growth, but by contact with each other the embryo of the seed is produced. When the anther is fully developed, the external case which contains the pollen bursts, and pollen-grains are distributed upon the surface of the stigma. No sooner does the pollen-grain arrive upon the stigma than it

I loses its spherical shape, and becomes elongated, forming the so-called pollen-tube. It is this tube which, passing down the style, becomes applied to the embryo-sac and is the cause of the development and growth of the embryo. A question has, however, arisen as to whether the pollen-tube acts dynamically upon the embryo-sac, or becomes part and parcel of the new embryo. Schleiden maintains that if the pollen-tubes be followed into the ovule, it will be found that usually one, and rarely more penetrates the intercellular passages of the nucleus and reaches the embryo-sac, which being forced forward, is pressed and indented, and by its folding-in, forms the embryos in the first stages of development. A bag is thus formed consisting of a double membrane, the indented embryo-sac, and the membrane of the pollen-tube itself. Schleiden infers the identity of the embryo and the pollen-tube from the three following circumstances:—1. The constantly equal diameter of the pollen-tube when it is just within it, 2. The invariable chemical similarity of its contents shown by the reaction produced by the action of water and of sweet almonds, iodine, sulphuric acid, and alkalies. The general contents of the grain of pollen are starch, and this either proceeds unchanged downwards through the pollen-tube, or else passes along after being changed by a chemical vital process into a transparent and colourless fluid, which becomes gradually more and more opaque; and is consumable by the application of alcohol; out of this, by an organising process, the cells are produced which fill the end of the pollen-tube, extending in Orchis Moifo far beyond the ovule, and thus forming the parenchyma of the embryo. 3. The identity of the embryo and the pollen-tube is further supported by the fact, that in such plants as bear several embryos, there is always precisely the same number of pollen-tubes present as we find embryos developed.
We now pass to the consideration of the function of Reproduction amongst Animals. General Reproduction occurs in many of the lower animals in the same manner as plants. There is a common reproduction of destroyers which frequently extend to the entire limb. This is seen amongst the Rakiota, especially the Echinoderma, also amongst the Articulatea. The highest families of animals in which this kind of reproduction occurs regularly are the Suckers, and in each such institution cells are being renewed. Occasional instances occur in which the limbs of higher animals are reproduced. The case of a Thrush, in which such renewal had taken place in a leg, was brought before the British Association meeting at Hull. A case of the same sort was also reported in which the leg having been removed, it was again reproduced almost entirely.

Reproduction by division into two, or by gametom. The Siphonar and Gemmiferous methods of Reproduction, occur to a very considerable extent among the lower animals. These modes of reproduction do not essentially differ, and both occur in the same families of animals. [Hydra, S. 2; Polyzoa, S. 16.] The individuals which are thus produced by fission or by gametom are called Zooids. This process occurs in unicellular as well as in multicellular plants and animals, and the single cells produced by the division of the Blastula, the Dictyostylus, and the Vorticella, are as much entitled to the term Zooid as the more complicated forms of the Ascomycetes.

The generative act is performed in animals in the same manner as plants. In order to the production of the new individual it is necessary that there should be a union of germ-cells on the one hand with sperm-cells on the other. We shall not here attempt to describe the various forms of organization that have developed on this plan. In the generation of new plants and germ-cells occur. They are described in considerable detail in this work under the head of the families, and sometimes of the genera and species of the various animals described. We shall however describe generally that sperm-cells and germ-cells in animals are usually produced from tissues and organs that are structurally different, but as in plants these organs may be placed on different individuals, or on the same. When the two sets of cells, the sperm-cells and the germ-cells, are said to be Hermaphrodite; but if these cells are found on different individuals they are said to be Monosexual. The term Hermaphrodite is also applied to plants; but when their sperm-cells and germ-cells are placed on different flowers, as happens sometimes in the Phananogamia, they are called Monocious and Dioecious.

The sperm-cells in the animal kingdom assume a more definite form than those of the vegetable kingdom. In the higher animals the sperm-cells often move as distinct, free-moving filaments, they most closely resemble those of the animal kingdom. These filaments are formed in the interior of cells, from which they escape by bursting. They usually present an elongated filamentous appearance, with a slight conical extremity. At one time they were regarded as a kind of animalcule, and called 'spermatic animalcules', and were supposed to have an interior organisation. This is not the case, and they have no more claim to be regarded as animalcules than moveable blood-dicks, or ciliated epitheliums. The movements performed by these bodies are in many instances due to the presence of cilia, which are found upon their surface. The movements of such filaments would vary according to the disposition of the cilia. In other cases the movements are due to remittances of activity. At one time it was very obvious to bring the spermatozoon, as these spermatic filaments have been called, into contact with the germ-cell. These movements soon cease after the filaments have been removed from the matrix in which they have been formed. Some agents rapidly destroy these movements, whilst others renew them after they have apparently ceased. This subject has been recently investigated by Kölliker, and the results which he has arrived at in regard to the movements of filaments of Mammalia, are embraced in the following propositions —

1. In the spermatic fluid, taken from the epididymis and vas deferens, motile spermatic filaments exist in very great abundance.

2. Spermatiferous and aqueous solutions of all innocuous indifferent substances and salts, the motion of the filaments ceases, and they form loops.

3. These filaments, thus furnished with loops, are not dead, as has hitherto been generally believed; for on the
12. The sperm-fluid dried in indifferent substances, and in saline solutions, may, in certain cases, have its motion restored by dilution with the same fluid, or with water.

4. Certain vehicles, when considerably concentrated; or highly saline, which are not too acid nor too alkaline, nor too viscid, the motions of the spermatic filaments are uninjured; this is the case, for instance, in blood, lymph, alkaline or neutral urine, alkaline milk, thin mucus, thick bile, the gastric juice, the juice of the gall-bladder, decrystallized ammonium uric acid, milk or mucus, the gastric juice, thin bile, and thick mucus. When the proper degree of concentration of the latter fluids is successfully attained, and their reaction is rendered neutral, they are innocuous.

5. Certain indifferent substances moderately concentrated, the filaments move with perfect facility—thus in all kinds of syrup, in albumen, urea, glycerin, salicin, amygdalin. More concentrated solutions of these substances cause the motion to diminish, but is restored by their subsequent dilution with water. Too dilute solutions act in the same way as water (vide 2 and 3).

6. Certain solutions, as they are termed of indifferent organic substances act like water, however much they may be concentrated, such as solutions of gum arabic, vegetable mucus (gum tragacanth, mucilag of quinse-seeds), and of dextrin. Concentrated solutions of other substances, in this case also, restore the motions.

7. Many organic substances cause the motions of the filaments to slow down, and chemically affect them, as alcohol, cresote, tannin, and ether; others owing to their mechanical effects, as most oils. Narcotics, in certain degrees of concentration, are not injurious.

8. Metallic salts are injurious, even in extremely dilute solutions; 1 part of a solution containing 1-10,000th of a corrosive sublimate is fatal.

9. Most of the alkaline and earthy salts are innocuous in certain degrees of concentration, which in some is greater and in some less; so little hurt they do, and fact, are, that some of the filaments may be kept alive in them for from one to four hours. Among these may be enumerated solutions of common salt; chloride of potassium; sal ammoniac; nitrate of soda; nitrate of potash, containing 1 part to 100; moreover, solutions containing from 2 to 10 parts in 100 of phosphat of soda; sulphate of soda; sulphate of magnesia; chloride of barium. As regards some of these salts, the fact had been previously noticed by older writers, and more recently by Quatrefages, Newport, and Ankermann. Solutions unduly diluted have the same effect as water, and cause the formation of loops, but the filaments are revived upon the addition of a concentrated solution of the same salts and of indifferent substances (sugar, urea, &c.). Stronger saline solutions than are required, at the same time as the presence of filaments like those just described, the filaments are capable of revival upon the addition of water. These saline solutions can be regarded properly as revivers, as was asserted not long since by Molecules and Ricchetti, for filaments which have become quiescent in indifferent solutions, can be brought back to life again by them; and their action is widely different from that of the real excitant—the caustic alkalis. It cannot be denied that their influence is very favourable, and that (but perhaps owing only to their rapid diffusion in the water) they produce motion in a semisaline mass more rapidly than other less diffusible substances, such as sugar and albumen; on which account the above-named authors ascribe reviving properties to them—a fact which, before them, had been made known to posterity by Ankermann, who stated that the uree, Newport, for carbonate of soda and potas; which latter substances, moreover, in certain experiments, caused the motion to cease in 10' or 15', almost like the caustic alkalis.

10. Acids, even in very small quantity, are injurious; such as hydrochloric acid, in the proportion of 1-10,000th of their liquid.

11. Caustic alkalis (soda, potas and ammonium, not lime and barytes), in all degrees of concentration, from 1-5th to 6-10th, are special excitants of the spermatic filaments. Venoms, which is stated above, can be used in the old sperm-fluid, or have ceased to move in indifferent solutions, the above substances recall the most active movements which are not distinguishable from the vital. But these motions cease after two or three minutes, and from this quiescence the spermatic filaments are not in any way benefitted—spermatic filaments are, with indifferent substances in small proportions (from 1-1000th to 1-500th), as, for instance, in syrup, the caustic alkalis afford a means by which the motions of the spermatic filaments may be maintained for a long time.
"The substance that combines the globules and granules of the yolk is in many animals quite fluid. The yolk then completely fills the cavity of the zona pellucida, and escapes in a liquid form when that membrane is ruptured: but in ova of the human subject, and some animals, the yolk is much more tenaciously retained in the cavity of the solid globular mass when the zona pellucida is torn. It is, according to Bischoff, solely owing to this firm consistence of the yolk that it in many cases preserves its form when a watery fluid passes by imbibition through the zona pellucida, and that the vitellus is destined to fill another, a solid, or a thin and delicate membrane. From the appearances resulting from the action of water on the ovum, and from other circumstances, it has been thought that the mass composing the yolk is surrounded by another membrane within the zona pellucida, but the evidence of this has not satisfactorily been established.

"In the substance of the yolk is imbedded the germinal vesicle, or vesícula germinativa. This vesicle is of greatest relative size in the smallest ova, and is in them surrounded closely by the yolk, nearly in the centre of which it lies. During the development of the ovum the germinal vesicle increases in size much less rapidly than the yolk, and comes to be placed nearer to its surface. In a mature ovum of the rabbit it is about one-sixtieth of a line in diameter (Bischoff) and is therefore not seen by the naked eye. Whether the germinal vesicle is a true yolk of the ova, or whether it is the essential part of each egg, has not been ascertained, owing to the difficulty of isolating it. It consists of a fine transparent structureless membrane, containing a clear watery fluid, which in some are sometimes a few granules. In the common rabbit's egg the germinal vesicle, which is nearest to the periphery of the yolk, is situated the germinal spot, a finely-granulated substance, of a yellowish colour, strongly refracting the rays of light, and measuring, in the Mammalia generally, from 1-3600th to 1-3400th of an inch in diameter (Cuvier). (Kirkes and Paget, 'Handbook of Physiology.')

The act of fecundation is effected in the same manner in animals as in plants, that is, by the contact of the sperm-cells with the germ-cells. Much discussion has taken place as to how this occurs. The following facts, however, are commonly regarded as embracing the facts most generally accepted:—As the germinal vesicle becomes fitted for fecundation, it loses its pellicular character, arising from the development of a large number of cells in its interior. It is at this period that the spermatic filaments come into contact with it, produce that tendency to growth which results in the formation of the new being. The nature of this contact has been a question. Mr. Newport, however, in a series of very carefully-conducted experiments upon the Amphibia, comes to the conclusion that the spermatic filament penetrates the vitelline membrane, and comes directly in contact with the germinal vesicle. There is no special foramen for the admission of the spermatic filaments, but a minute aperture in this membrane, and may be seen floating about in the yolk. Mr. Newport found that a single spermatozoon did not produce fecundation, but that the penetration of several were requisite for this purpose.

In the human ovum, the ova are brought from the ovaries along the Fallopian tube into an organ called the uterus. It grows rapidly after reaching the uterus; it at first consists of two sacs, one inclosing the other, and the inner containing a liquid. When it is about half a line in diameter a new element becomes visible in it; a round, opaque, granular disc is seen, with a dark spot in its centre, upon the surface of the internal globule or sac. This spot, which is seen either on or through the inner membrane of the ovum, corresponds with the cicatricula of the egg, and is the first rudiment of the foetus. In birds the cicatricula, or germ-spot, lies upon the surface of the yolk; soon after the commencement of incubation it expands and separates into two layers; the outer is called by Pander the serous layer, and the inner is formed from the osseous, muscular, and tegumentary systems of the body; the inner, which is in contact with the yolk, is called the mesothelium, which (together with a third developed between the two others) forms the yolk-sac. The yolk-sac expands to rise, by the changes which it undergoes, to the intestinal, respiratory, vascular, and glandular systems. The mucous layer of the germinal membrane gradually expands over the yolk-sac, and shews itself in a sac, which towards the body of the chick contracts into the alimentary canal, which extends the whole length of the embryo, and becomes the future alimentary tube. The sac containing the yolk, and communicating with the intestines, is called the intestinal vesicle, or yolk-bag, and towards the close of incubation is drawn into the belly of the chick, and its contents are used as nourishment. The lower end of the alimentary canal (the cloaca of birds) shoots out into a sac which is termed the allantois, or allantoid membrane. After a time arteries and nerves ramify in the allantois, and this gradually extends more and more out of the body of the chick, till at length it forms a double bag, laid immediately under the membrane of the shell. On this sac the blood-vessels are so distributed that their contents are influenced by the atmosphere through the yolk-sac, or alimentary canal, and the skin under the membrane, and thus a true respiratory organ is established.

The original structure of the ovum, and the early development of the embryo, in Mammalia, appear to be much the same in the egg of a bird; though there are some curious variations not to be described here. When a certain latitude is examined, the embryo is seen suspended in a loose bag filled with fluid, called the amnion, which is a shut sac; this sac is the outermost product of the serous layer of the germinal membrane; for its formation a membrane is reflected from the sides and extremities of the embryo (the reflection, according to Valpeau, not commencing before the twelfth day), so as to inclose a space behind it. As the walls of the trunk close in front, the circle at which the amnions is ruptured, the amnioscopic sac is drawn in, and at length is limited to the edge of the umbilical opening; it then invests the umbilical cord, and spreads out from its placental extremity into an amnion sac filled with fluid; is now entirely cast off, and is attached at one point only, the umbilicus. The membrane in Mammalia is supposed from analogy to form a sac, as in birds, containing a yolk, or substance subservient to the nourishment of the foetus in its early stage. Whether this view of its formation and use be correct or not only rests on conjecture. The umbilical bladder, which from its being filled with a whitish fluid has been called the vesícula alba, may be found on the placenta, at or near the extremity of the umbilical cord, and exterior to the amnios; from this sac a fine tube may be traced along the cord to an opening in the skin and membrane, in which it is communicating with the intestinal canal. This tube becomes obliterated so early (Valpeau says in the sixth week of gestation) that its communication with the intestines was long undetected; though the sac was known to the old anatomists. The intestinal vesicle finally differs in Mammalia and birds in this circumstance, that in the former it is not drawn into the body of the foetus, but remains without between the membranes, and gradually wasting becomes obliterated by the third month. The duct of the umbilical vesicle is accompanied along the cord by an artery and vein, which are called the omphalo-mesenteric vessels; the artery communicates with the superior mesenteric, and the vein with the inferior mesenteric. This sac, therefore, as well as in birds, though its use in the former, which are furnished with a placenta, is not obvious. In some animals, as in man, it becomes obliterated at a very early period, as soon as the sixth week, but in others, as the Corvacea, etc., it is still in operation and continues as an organ of foetal existence. In Mammalia it communicates with the fundus of the bladder, and the remains of the duct by which it is connected is denominated the urachus. The channel of communication between the allantois and the bladder, or cloaca (in birds), at first is short, so that the sac lies directly against the body of the embryo, but it afterwards becomes elongated, like the corresponding duct of the umbilical vesicle.

In the embryo impregnation has taken place, a spongy membrane is formed on the inner surface of the uterus by an exudation of lymph. This membrane, called decidua, lines the whole of the uterus before the descent of the ovum; but when this passes down through the Fallopian tube it gradually pushes the decidua sac, which is stretched out, and inserting one portion of it which surrounds the ovum, and is called the decidua reflexa; this grows with the ovum till it fills the cavity of the uterus, and comes in contact with the inner portion called the decidua vera, lining the walls of the uterus. The point at which the decidua is reflected upon the ovum is where the placenta is fixed to the uterus. The ovum has two proper membranes, the amnios, which we have described, and the chorion; this latter membrane in man, during the first two months of pregnancy, has a shaggy external surface, being covered with vascular villi, which become united with the
membrana decidua, which is also thick and vascular. This thickening and vascularity of both these membranes gradually increases, and the vessels composing them usually point towards the fundus of the uterus; this thickened part is called the placenta. In ruminating animals the thickening and vascularity of the chorion is confined to a number of vesicles or vesicular elevations, from thirty to one hundred, which are called cotyledons. These vascular processes dip in corresponding processes attached to the uterus of the mother, which are called maternal cotyledons, the surface of which is supplied with numerous vessels descending from the arteriae uterinae, and by those of the fetus through the fine intervening membranes by which they are separated. In man the relation between the maternal and fetal systems is not so clearly understood as in the preceding instance. In the human subject the placenta is a spongy vascular mass like a cake, from six to eight inches in diameter, about an inch thick in the middle, and two or three lines at the circumference. It adheres by one surface to the uterus, and by the other is connected with the body of the mother. The surface is lobulated, and is connected with the uterus by blood-vessels. The fetal surface is covered by the chorion and amnion, and presents the ramifications of the umbilical vessels, which consist of two arteries and a vein. The radicles of the umbilical arteries cannot be distinguished, and no communication has ever been shown to exist between them and the utero-placentine vessels; for if we inject from the umbilical arteries we find that the placenta is rendered turgid, and that vessels are found filled in every part of it, but between their ramifications there will remain an un.injected substance, and the uterine surface will not be injected, for the fetal vessels do not pass all the way to that surface. In like manner, if we inject from the uterine vessels, the placenta is rendered turgid, and relations similar to those already stated. From this circumstance it is concluded that the placenta consists uniformly of two portions: the one is furnished by the deciduous coat of the uterus, the other by the vessels of the chorion, and these two portions may, during the first three months, be separated from each other by maceration. The structure of the fetal portion, so far as can be made out, appears to be similar to that of the pulmonary vessels, the artery terminating in the vein. But the manner of termination of the umbilical vessels differs from that of the communication, but the arteries, as Mr. Hunter thought, seem to terminate in irregular cells, and the veins appear to commence with open mouths from these cells, for by throwing wax in the uterine arteries we fill the cells, and frequently the veins also. It has always been considered doubtful whether the placental cells of Hunter were real or artificial, being, in the latter case, produced by extravasation of the injection; and recent researches have confirmed this doubt, but without throwing any satisfactory light on this very obscure subject. With regard to the use of the placenta we may infer that it is very similar in man to what it is in ruminating and other animals; it must probably serves to produce a change in the blood of the fetus analogous to that which the blood of the adult undergoes in the lungs; and, from considering that the fetus itself cannot create materials for its own growth and support, we may further infer that the placenta is the source of nutrition. The umbilical vessel, or umbilical cord, which connects the child to the mother, is composed of the umbilical vein and two umbilical arteries twisted together, and surrounded by a gelatinous substance and the reflections of the chorion and amnion; it also contains the umbilicus, and the remains of the duct of the vesicula alba and omphalo-mesenteric vessels. It is visible in the human embryo in the sixth week as a short and straight cord; at birth the length of it is, on an average, about two feet. The outer tunic of the cord, the amnion, is a serous membrane, also has the same name, the umbilicus, and in the same way the chorion, which is also reflected on the navel-string, is continued into the dermis, or true skin of the fetus.

The development of the embryo is marked by the development of the principal organs of the human embryo. The future embryo. It consists of a very small longitudinal groove in the middle of the upper surface of the serous lamina. In this groove the amnion is raised to form the laminae dorsales. They grow over towards each other, meet in a longitudinal suture, and thus inclose a cavity, the primitive tube. Anteriorly this tube dilates into the neural vesicle, which lies behind each other, and in which is deposited the cerebral substance. The latter is divided down in its remaining cylindrical portion. The several parts of the brain of the human embryo gradually pass through numerous transitional forms, which correspond with their permanent conditions in various of the lower animals. A dense cord, the chorda dorsalis, is early deposited beneath almost the whole length of this primitive tube. At the same time, square spots are observed on either side, symmetrically arranged in pairs. Each two corresponding squares subside towards each other, to construct the body of a vertebræ. In doing this, they include between them a corresponding segment of the chorda dorsalis, and gradually altogether displace it. In Mammalia and birds, the remaining portions of this structure subsequently disappear. The vertebral arches commence as dense curved pairs of streaks; each of which unites on the one hand with the body of the vertebrae, and on the other with its opposite fellow. The various processes of the vertebrae are only added subsequently. The first rudiment of the skull is formed by a membranous capsule, which gradually merges into a special cartilaginous covering, called the primordial skull. Some portions of the membranous capsules are formed by a similar process, and others disappear after new pieces of bone have been opposed to them. The blastema adjoining the interior surface of the skull produces a series of pairs of processes, which gradually give rise to the chief structures of the face and neck. Those which lie between the future mouth and the teeth, and are called the branchial or visceral processes; and the fusions which remain between them, the branchial fusions. Their form is similar to that which supply them source, and give whatever type the met with in the gills or branchial respiratory organs of the fish.

The margins of the central portion of the serous lamina are gradually involuted, so as to form the walls of the thoracic and abdominal cavities. But as they only subsequently meet in the inferior median line of the embryo (which we are supposing to be horizontal), there remains at first a long fissure, through which is protruded the heart, a large portion of the liver, the gonads, and the hinder parts of the cranium, and nerves which afterwards close in the region of the thorax, and the posterior part of the abdomen; and finally disappears, leaving no relic save the navel. The rim commences as dense striae, which first become cartilaginous, and are then ossified. The several pieces of the thoracic and abdominal wall are developed in a very free manner, each possessing a free terminal plate which is developed into the hand or foot. The fore arm and leg are only formed subsequently. The fingers and toes are at first united by a kind of web, so as to resemble fins. This membrane begins to disappear from without inwards. The eye at first forms a hollow vesicle, which is connected with the brain by a tubular handle, the future optic nerve. The retina is produced from a deposit which resembles that of the chordee in the mammalian brain. The crystalline lens, the vivid humour, and the iris, are only developed subsequently. A special vascular tunic, the capillaro-papillary sac, surrounds the lens of the early embryo. Its anterior segment then forms the papillary membrane, a vascular coat which is stretched immediately in front of the papillary aperture. By the gradual loss of its blood-vessels, this is converted into a simple transparent membrane, which disappears a few days after birth. The labyrinths are formed from the same vesicle, having a handle which is continuous with the brain. The vestibule, the cochlea, and the semicircular canals are then developed, at what is comparatively a very early date. The formation of the auditory ossicles is ultimately connected with the development of the most anterior part of the vertebral column. The cartilage which is developed in the upper part is in a day or two in a day or two. At this period the long process of the maleus extends on the first maxillary process, or the future lower jaw, as far as
to the median line; in the \textit{Mammalia}, however, it afterwards gradually disappears, so as to leave scarcely a trace. This trace is, however, generally recognized at the first visceral arch. The external ear is produced last of all.

The organs of smell are also first indicated by vesicles, which are connected with the brain. These begin to develop, after the face, during the evolution of the face. The palate, which is subsequently laid down, ends by separating the cavities of the nose and mouth. The tongue grows out of the first maxillary arch. The external integument is only separately developed at the end of the second month, or the beginning of the third. It afterwards acquires its nails, together with its various glands and hairs.

In the advanced embryo, almost all the surface of the body is covered by a very fine down. The copious desquamation and fatty secretion of the skin result in a caisson substance, which covers many portions of the fetal body, and is capable of protecting it like an ointment from the injurious action of the liquor amnii.

Those primitive changes by which many of the embryonal organs commence, are effected without the aid of the vascular system. The heart subsequently begins as a tube, which, anteriorly, is continuous with centrifugal vessels or arteries; posteriorly, with centripetal tubes or veins. It afterwards undergoes a change by which it divides into the four chambers, produces the auricular appendages, and finally, presents two auricles and a single ventricle. The latter gradually acquires a septum, which is at first an incomplete, and finally a perfect one. These embryonal vessels gradually undergo numerous changes, and finally become divided only into the left and right branches, or morphosis of those organs of the body that are rich in vessels, but also to a variety of causes which belong to the vascular system itself.

The contrast of a systemic and a separate circulation obtained at a very early date. A great part of the surface of the yolk is at first covered by a vascular distribution, the aorta vasculosum, in which the blood of the embryo is changed by a process, the details of which are at present unknown. This part of the aorta vasculosum begins soon after the heart of the embryo has commenced to beat. In the \textit{Mammalia} it subsequently disappears, to make way for the placental circulation. The blood then runs through the umbilical arteries into the fetal placenta, where it undergoes a diffusion with the blood of the maternal placenta, returning to the fetus through the umbilical vein. The renovation thus produced corresponds, not only to the respiration of the more developed being, but also to the most pressing requirements of its nutritive processes.

The connection between the state of development of the heart and that of the great vessels, produces a peculiar movement of the blood which has been designated the foetal circulation, or the circulation of Sabatier. It is most distinct shortly after birth, when the placenta is still present. The blood of the right ventricle then passes chiefly into the lower half of the body and the placenta; while that which returns from this organ goes chiefly to the left heart, in order to flow thence to the head and neck, from which it finally returns to gain the right auricle and ventricle. So that there is a partial contrast between the circulations of the upper and lower halves of the body. After birth it is replaced by the systemic and pulmonic circulations.

The placental circulation ceases soon after birth, being replaced by the pulmonary on the respiration of air. But in the normal course of development the preparations necessary for this change are made some months before the end of pregnancy. Hence, under favourable circumstances, a child which comes into the world seven or eight months after conception may nevertheless continue to live.

The foramen ovale is due to the fact, that the inferior vena cava originally opens into the left auricle, and not into the right. The blood is gradually pushed over into the latter. This explains why the right auricle is at first the larger and that return of blood from the umbilical vein and the lower parts of the body passes into the left auricle during the foetal circulation. The groove which conducts it in this course is the relief of a special channel, the former caval groove. Immediately after the birth its functions having ceased when once the child has breathed.

By the foramen ovale is due to the fact that the heart and ductus arteriosus to the different parts of the body. In the embryo, the blood passes through the ductus arteriosus into the aorta; but after birth it becomes occluded. The superior and inferior vena cava then belong exclusively to the right auricle.
both systems of vessels. The purified blood is brought from the placenta by the umbilical vein, and is mixed before arriving at the heart with that which has been circulating through the fetus: the mixed blood is then transmitted by the aorta to various parts of the body; some of it only goes again to the placenta by the umbilical arteries to be again purified.

The position of the child in the uterus is that which takes up the least room; it lies with the head downwards, the chin being bent on the breast; the knees are doubled up, and they are close together between the head and legs. This is the most general position, and the child thus forms an oval figure, of which the head forms one end and the breech the other. The long axis of this ellipse measures in the ninth month fully ten inches, and the short axis only five. This is the position in which the child remains throughout the whole of its nourishment, and very generally requires a supply of warmth and a degree of protection till it is able to provide for itself.

RESPIRATION is that function in the animal kingdom by means of which the various tissues of the body are exposed to the chemical influence of the gases of the atmosphere, and the products thus formed expelled from the body. The advance of chemical knowledge has demonstrated that this process is not taken up by the lower forms of life of the vegetable kingdom. It has been proposed to consider all cases of oxidation in organic bodies as instances of respiration. Such an extension of the term has led to its application to plants as well as animals. It should however be remembered that the older physiologists applied the term Respiration to that function of plants by which they take up carbonic acid and give out oxygen, and which was regarded as an equivalent process to the taking up of oxygen and disengaging carbonic acid in animals. It was subsequently found that plants, during certain periods of the day, give out carbonic acid gas; and it was hence inferred that plants perform a function essentially the same as that effected in animals by the oxidation of carbon in respiration.

The animal, or man, who has been observed to consume oxygen and throw off carbonic acid are as follows:—1. During the growth of the order Funghi. 2. During the growth of the leafless parasites. 3. During night by most plants. 4. During the active growth of the Conifers. 5. During the flowering of most plants. 6. During the germination of plants. This process has been observed to be attended with the same results in certain of these cases, as in respiration of the higher animals, that is, with the disengagement of heat. When the process of oxidation takes place rapidly, disengagement of heat is the necessary result. That these plants perform a function in the vegetable kingdom is not a constant phenomenon, but only occurs occasionally in the life of the plant. It is during the latter stages of the growth of Funghi that it is observed, when it may be supposed that these plants are entering upon a stage of decay. The existence of the process is in agreement with the second respiratory laws, which unite readily with oxygen. Again, in the flowering of plants it is only an occasional and exceptional phenomenon in the life of the plant. The carbonic acid given out by plants at night can be quite as readily accounted for on the supposition that a certain amount of oxygen is respired, and the excess of carbonic acid taken up in the day has been undecomposed, and is given out at night, as on the theory of its being the result of oxidation. So likewise in germination, the carbonic acid produced as the result of a process of life in the young embryo, but of a process of decomposition going on in the stalk of the among which it is surrounded.

2. If the term Respiration is to be applied to the evolution of carbonic acid, and absorption of oxygen gas from the fluids of organic beings wherever found, then it must be used to comprehend the processes of fermentation, putrefaction, and emaciation, which take place either out of the structure or in the interior. The carbonic acid given off from food in the stomach or intestines of a human or animal has assuredly to be regarded as the result of respiration, yet this would be the case if we accepted a more chemical definition of respiration.

Respiration then appears to be a purely animal process, by which the fluids of the animal are brought into contact with the oxygen of the air, the final result of which is the discharge of carbonic acid gas. This process is continuous in the animal kingdom; and in the great majority of cases in the higher animals. When the animal dies, the processes of respiration ceases. When a animal dies from being deprived of oxygen gas, it is said to be suffocated. In the higher animals special organs are provided for the performance of this function. This function consists in the taking up of oxygen gas directly from the atmosphere, and allowing the carbonic acid to escape. Hence these arrangements have been called Organs of Respiration. It should however be understood that the chemical changes involved in the process of respiration are carried on in the tissues themselves. The lunge, gills, or sacs, are organs where the blood receives the oxygen gas, and gets rid of its carbonic acid; whilst the capillaries of the systemic circulation are the organs by which the blood absorbs oxygen and disengages carbonic acid. The process of respiration than is the same in the highest as in the lowest animals, with this exception, that in the lowest animals there are no organs of circulation, and no organs of ventilation, as the lungs and gills may be referred, for the oxygenating the carbonic acid and to and from the tissues.

The absorption of oxygen by the animal cell seems to affect three great objects:—1. The preparation of the materials required for the combustion processes. 2. The removal of certain constituents which have been employed in nutrition, and destroyed during the performance of the function of the part. 3. The production of heat, arrangements for the accumulation of which are made in the higher animals, which are from this circumstance called warm-blooded. That the performance of one or other of these functions is essential to the life of animals is seen from the fact that, should the supply of oxygen to the tissues of an animal be limited or suspended, they exhibit deficient vitality or die. It is not on this account, however, that animals are not protected by this deprivation, but all; so that we find the amount of oxidation performed by this process becomes the exponent of the amount of vital activity displayed by any particular animal. With the lower animals, respiration of an animal is great it consumes more oxygen, and gives off more carbonic acid, than when it is small. Thus, in animals which hyperventilate, the amount of oxygen consumed, and carbonic acid given out, is much less during their period of repose than during their period of activity. Sluggish and slow-moving animals consume less oxygen than those which are active. Thus the Molusca consume less oxygen than the various tribes of active insects. It is also found that animals whose movements are slow will support the absence of oxygen gas for a very much longer time than those whose movements are quick.

Under the head of the various articles devoted to the classes and families of animals some account is given of the arrangement of the respiratory organs. In the lowest forms of animals, the Infusoria, the whole surface of the animal is exposed to the fluid in which they live, and which contains the oxygen necessary to produce the respiratory changes. When a number of cells are taken together, as in the sponges, and cavities or tubes, as seen in many of the polypaegric amebules and the sponges. Passing higher in the forms of animals, we find the method of introducing water into the interior of the animal becoming more complicated, till in the Holothurids we find a special system of vessels for supplying this fluid, which have been called an 'vascular' system, and which becomes more fully developed in the Echinids, the lowest tribe of the Articulata.
These arrangements amongst the lower animals are preparatory to the two predominant forms of respiratory apparatus which are found in the higher animals. The provision for supplying the system with oxygen is in them made by means of a fluid called blood, and which is carried in a circulating apparatus to all parts of the body. This circulating apparatus brings the blood in contact with the air by one of two arrangements. Either the aërating organ is a projection from the surface of the body, when it is called a Gill, or it is a depression in the surface, when it is called a Sac or Lung.

The first of these arrangements is found in all animals which breathe through the agency of water, whilst the second is found in those which breathe air. In the Aquatic Mollusca, the Oyster, the Anemone, the Anemones, the Amphibia, and the perennibranchiate forms of that family, we meet with a vast variety of forms of gills adapting these animals to lead an aquatic existence. On the other hand, we find in the Terrestrial Mollusca and the Insects the simplest forms of air-breathing apparatus; whilst in the Reptiles, the Birds, and Mammalia, we have varied forms of lungs.

Man breathes by means of lungs. The structure and arrangement of those organs, and the nature of the movements performed by the muscles which contribute to the performance of their peculiar function, are described under the article Lungs. The lungs of man are so constructed that they expand uniformly and are carried on by air. During expansion, a certain quantity of air is taken into the lungs, and this act is called Inspiration. This expansion is followed by a corresponding collapse, during which the lungs occupy a smaller space and a certain quantity of air is expelled; this is called Expiration. The movements of Inspiration and Expiration influence the circulation in the human lungs at each respiratory effort varies. It is however easily measured by blowing into a vessel filled with water or other fluid, when the amount of fluid displaced will be the measure of the quantity of air thrown out from the lungs. Instruments of this kind, with an index attached, under the name of Sphygmometers, are now frequently employed as a means of diagnosis in diseases of the chest. The difficulty however of securing freedom from disturbing causes renders their results less to be depended on than could be wished. The quantity of air thrown out from the lungs has been variously estimated, and probably from 20 to 25 cubic inches is near the truth. Scharling conducted a series of experiments on the quantity of carbonic acid thrown out of the lungs by persons of different sexes and various ages. The following table gives an idea of the average relations of the excretion of carbonic acid gas during one hour:

The air that is habitually and almost uniformly changed in breathing is Mr. Hutchinson socalled Fresh Air.

"The quantity over and above this which a man can draw into the lungs in the deepest inspiration he names Complemental Air; its amount is various, as will be presently shown. After ordinary expiration, such as that which expels the breathing air, a certain quantity remains in the lungs, which may be expelled by a forcible and deeper expiration: this he terms Reserve Air. But even after the most violent expiratory efforts the lungs are not completely emptied; a certain quantity always remains in them, over which there is no voluntary control and which may be called Residual Air. Its amount depends in great measure on the absolute size of the chest, and has been variously estimated at from 40 to 800 cubic inches."

"The greatest respiratory capacity of the chest is indicated by the quantity of air which a person can expel from his lungs by a forcible expiration after the deepest inspiration that he can make. Mr. Hutchinson names this the Vital Capacity; it expresses the power which a person has of breathing in the emergencies of active exercise, violence, pain, and disease; and a healthy man it varies according to stature, weight, and age.

"It is found by Mr. Hutchinson, from whom nearly all our information on this subject is derived, that at a temperature of 72 degrees, and the height of a healthy person 5 feet 7 inches in height. For every inch of height above this standard the capacity is increased on an average by 8 cubic inches; and for every inch below it is diminished to the same amount. This relation of capacity to stature holds true in all ages, but it is anticipated at the puberty of the chest; for the cubic contents of the chest do not always or even generally increase with the stature of the body, and a person of small absolute capacity of chest may have a large capacity of respiration, and vice versa. The capacity of respiration is determined only by the mobility of the walls of the chest; but why this mobility should increase in a definite ratio with the height of the body is yet unexplained, and must be difficult of solution, seeing that the height of the body is chiefly determined by that of the legs, and not by that of the trunk or the depth of the chest. But the vast number of observations made by Mr. Hutchinson leave no doubt of the fact as stated above.

"The influence of weight on the capacity of respiration is less decided. He says that it is difficult to arrive at any definite conclusions on this point, because the natural average weight of a healthy man in relation to stature has not yet been determined. As a general statement, however, it may be said that the capacity of respiration is diminished by 1/4 pound for every 161 lbs. 114 stones; but that above this point it is diminished at the rate of one cubic inch for every additional pound up to 196 lbs., or 14 stones; so that, for example, when a man of 5 feet 6 inches, and weighing less than 144 stones, should be able to expire 217 cubic inches, one of the same height, weighing 1/2 stones might expire only 303 cubic inches."

"By age the capacity appears to be increased from about the 15th to the 30th year, at the rate of five cubic inches for every ten years of life. It decreases after the 30th year, and the decrease is much more rapid after the 60th year. Mr. Hutchinson gives a cubic inch and a half per year, so that the capacity of respiration of a man 60 years old would be about 30 cubic inches less than that of a man 40 years old of the same height and weight."

"Mr. Hutchinson's observations were made almost exclusively on men, and his conclusions are perhaps true of them alone; for women, according to Bourgey, have only half the capacity of breathing that men of the same age have."

"It is well known that inspirations could be made by force usually ranges from 14 to 18 per minute. According to Mr. Hutchinson, the force with which the inspiratory muscles are capable of acting is greatest in individuals of the height of from 5 feet 7 inches to 6 feet 6 inches, and will elevate a column of mercury of 15 inches. After this the force decreases as the stature increases, so that the average of men of 6 feet can elevate only about 2 inches of mercury. The force manifested in the strongest expiratory act, on the average, one-third greater than that exhibited in inspiration; but this difference is in great measure due to the power exerted by the elastic reaction of the walls of the chest, and it is also much influenced by the disproportions of the chest which the inspiratory muscles attain through being called into use for their purpose of respiration. The force of the inspiratory act is therefore better adapted than that of the expiratory for testing the muscular strength of the body."

"Much of the force exerted in inspiration is employed in overcoming the resistance offered by the elasticity of the walls of the chest and of the lungs. Mr. Hutchinson estimated the amount of this elastic resistance by observing the elevation of a column of mercury raised by the return of air forced through the lungs of a person at his known capacity of respiration during life; and he calculated that in a man capable of breathing 300 cubic inches of air, the muscular power expended upon the elasticity of the walls of the chest, in making the deepest inspiration, would be as 1 to 2, or at least as 1 to 3; and in a state of tranquil respiration, supposing the amount of breathing at 20 cubic inches, the resistance of the walls of the chest would be equal to lifting more than 300 lbs. The elastic force exerted in ordinary expiration must therefore be much
greater than enough to lift this weight; because in it the elastic force of the lungs is also in action—a force which is not included in these estimates, because the lungs were in both cases burst by the air forced into them." (Kirkes and Page, ‘Handbook of Physiology.’)

The changes of the air in the lungs effected by the respiratory movements are assisted by the air itself. It is a well-known fact that carbonic acid, although heavier than atmospheric air, is perfectly dispersed through the air, and diffused into the lungs, and that it is taken up without difficulty of the diffusion of gases. There is no doubt that this law is in active operation during the respiratory changes, and that it assists the oxygen in passing into the lungs, and the carbonic acid in passing out. If it were not for this interchange the reserve and residual air would probably be injudiciously charged with carbonic acid. It is also probable that the difference of temperature within and without the lungs assists in the interchange of the air.

The air which is taken into the lungs during respiration is the air of the atmosphere, which in round numbers consists of 31 of oxygen, and 79 of nitrogen in every 100 parts. A small proportion of carbonic acid exists in it, about 4 parts in 10,000. It also contains a varying quantity of watery vapour. The changes which occur in this air during respiration are: 1. It contains a larger quantity of carbonic acid gas. 2. Its oxygen is diminished. 3. Its watery vapour is increased.

An easy proof of the existence of carbonic acid in the air expired by the lungs, is afforded by blowing through a tube into lime water, when the carbonic acid will unite with the lime, and carbonate of lime will be precipitated. The quantity of this gas which is calculated by Calvett and Brunner, as thrown out from the lungs in 24 hours, is 1345.5 cubic centimeters, or about 6264 grains an hour. This would make about 1753 grains of carbon in an hour, or 8 ounces in the 24 hours. Andral and Guavarot calculated the quantity at 9 ounces, and Mr. Coshupe at 5 ounces. Liebig gives 12 ounces as the quantity of carbon thrown off from both the skin and lungs.

The quantity of carbon however which is thrown out from the lungs varies under different circumstances. As is seen in the preceding table, sex and age make a considerable difference in the quantity of carbon expired.

Diet exercises a considerable influence on the quantity of carbon thrown out from the lungs. The following table exhibits the quantity of oxygen required by certain articles of diet to convert them into carbonic acid and water. It should always be recollected in relation to this subject, that although carbon is spoken of so frequently, not only is carbon oxidized, but also hydrogen. Wherever hydrogen is present in the tissues, it sustains apparently the same relation to oxygen as carbon. Hence, in the calculation of the influence of diet on respiration it should never be left out—

The nitrogen of the atmosphere appears to act as a diluent, and to temper the activity of the oxygen gas. Although when animals are placed in atmospheres of pure oxygen, or hydrogen, a certain quantity of nitrogen is thrown out from their lungs, it still remains possible that this might work up from the atmosphere. It is not improbable that a certain quantity of nitrogen may be thrown off by the decomposition of the nitrogenous tissues in the blood, or excretions. With regard to the watery vapour which passes off from the lungs, it may be stated as a general rule that it is sufficient to saturate the expired air. Its absolute amount is therefore influenced by the following circumstances: 1. By the volume of air expired; 2. By the quantity of watery vapour contained in the air previous to its being expired; 3. By the temperature of the expired air; 4. By the length of time each volume of inspired air is allowed to remain in the lungs.

We have thus considered the principal physical and chemical phenomena presented during the respiration of animals. It should however be recollected that these phenomena are
dependent for their existence on the influence of the nervous system. All the respiratory movements effected by the muscular tissues, as far as they are independent of the consciousness of the individual, are under the absolute governance of that part of the brain which is called the medulla oblongata. It is this portion of the nervous system which acts as the centre of all the impressions which convey the necessity of breathing, and which initiates all the motions which result in respiratory action.

(Kirkes and Paget, Handbook of Physiology; Lehmann, Physical Chemical, translated for the Cavendish Society by Dr. Day; Valentin, Text-Book of Physiology, translated by Dr. Brinton.)

</table>

In 1852 the revenue amounted to £70,909,343, from the following sources:

- Customs 22,464,354
- Excise 7,472,202
- Stamps 3,049,224
- Tobacco (land and assessed) 15,137,996
- Property tax 2,892,000
- Post Office 2,734,000
- Customs (foreign trade) 97,674
- Produce of sale of old stores, &c., 11,922,004
- Money received from East India Company 60,000
- Interest and other moneys 407,957
- Unclaimed dividends received 87,134

The expenditure was—

- Interest and management of permanent debt 23,626,907
- Unclaimed dividends paid 88,531
- Terminable annuities 3,979,136
- Interest on Exchequer Bonds and Bills 988,616
- Civil List 401,479
- Annuities and pensions 337,028
- Salaries and fees, &c., to public servants 110,573
- Diplomatic salaries and pensions 155,569
- Courts of justice 576,421
- Miscellaneous charges on Consolidated Fund 177,017
- Compensation for abolition of Slave Trade 1,121,203
- Army 13,611,576
- Navy 10,590,000
- Pacific expedition 5,680,000
- Expenses of war in China 599,695
- Miscellaneous civil services 6,005,456
- Salaries, &c., of revenue departments 4,384,298
- Redemption of Exchequer Bonds 2,000,000

70,354,246

The salaries of the Revenue Department form a separate charge, and are no longer deducted as charges of collection before transmission to the Exchequer, and are consequently subject to parliamentary supervision.

The National Debt, funded and unfunded, at the end of 1852, was £605,282,699, of which £21,555,416 had been created in 1846. In addition to the sums shown as excess of income over expenditure in the preceding years, the greater part of which had been applied to the reduction of the Debt, an Act was passed in 1853 by which the South Sea Stock, certain Bank Annuities, and Three per Cent. Annuities, were incorporated with the National Debt on terms which involved something to the nominal amount of capital, but produced a large reduction in that of the interest paid.

In 1842 the Property Tax, as proposed by Sir Robert Peel, was imposed to remedy the annual defalcation in the revenue. It was assessed at £7d. in the pound on all incomes of 10l. a year and upwards. Its effects were visible in 1843, and enabled him to make extensive reductions in the custom and excise duties, to the great benefit of the commerce of the country, as well as the comfort of the inhabitants.

The excise duties necessarily interfere with the processes of manufacture—are unavoidably iniquitous—and are a check upon improvement. In 1797, not fewer than 2 articles were subject to duties of excise. The list includes salt, wine, behaviour, bread, clothing, and skins of the good, candles, bricks and tiles, starch, soap, stone bottles, sweets and meat, and auctions and glass. There were separate

The expenditure for the same year was £51,319,192, under the following heads:

- Charges of collection and other payments before reaching the Exchequer 4,189,159
- Interest and management of National Debt 24,357,137
- Terminable annuities 4,915,745
- Interest on Exchequer Bills and Notes 936,688
- Civil List 444,068
- Annuities on pensions charged on Consolidated Fund 578,966
- Salaries and allowances 194,042
- Diplomatic salaries and pensions 181,140
- Courts of fees 674,432
- Miscellaneous charges on Consolidated Fund 331,788
- Army 6,201,716
- Navy 4,705,688
- Ordnance 1,444,924
- Miscellaneous charges on annual grants of Parliament 2,513,029

50,592,446

Showing an excess of expenditure over income of £736,466. The burden of the public funded debt, on Jan. 5, 1852, was £704,705,037.

The following table gives the results from 1838 to 1852:—
Boards of Excise for England, Scotland, and Ireland, the functions of which were discharged by 23 commissioners. In 1858 there is only one Board for the whole of the United Kingdom, the number of commissioners has been reduced to seven and the number of articles 51. While the board interferes during the process of growth or manufacture has been reduced to four; namely, hops, malt, paper, and spirits. The amount of vexations meddling which has thus been got rid of can only be estimated by those who have had experience of it. In 1858, when the most conscientious respect for the law rendered it difficult at all times to avoid infringement of the regulations of the Board, and when a manufacturer was often at the mercy of the exciseman, and might easily be ruined by a written order of the Board, acting under the terms of imprescriptible and complicated rules which he was compelled to observe in carrying on his business.

In the department of the customs the practical reforms effected by government continued. At the time laws relating to customs were contained in no fewer than 1600 Acts of Parliament. In 1833 they were consolidated in a plain, simple, and intelligible form under one statute. At the same time the whole of the customs duties of the United Kingdom were enumerated. The Consolidated Act of 1846 is arranged alphabetically. The Consolidated Act of Customs Regulations and the Consolidated Tariff Act are all that the merchant will now require for his guidance in place of hundreds of labyrinthine Acts which these two simple codes replace.

In 1815 five years were required to effect a digest of the customs laws into 1376 pages; and in 1826 the work of consolidation was compressed into eleven separate acts, the first of which repealed 443 statutes, many of which had been obsolete, and enumerated 1110 different rates of duty chargeable on imported articles; and yet, in 1839, nearly 99 per cent. of the customs duty was contributed by 46 articles. In 1840 there were 1053 articles subject to the duties charged, of which the number in 1845 was 1842, and in 1853 the number was 469, and in 1853 the duty was entirely repealed on no fewer than 105 articles, so that, since 1845 the number of articles on which customs duties are levied has been reduced from 1053 to about 390. In 1866, however, there were 232 articles charged, and one of which amounted to 10,000l. in the year, and some producing the most insignificant sums; such as almond paste, 2l.; barley, pearled. 4l.; essence of spruce, 1l.; nux vomica, and oil of almonds, 2l. each. The whole yearly produce of the Excise is 5,000,000l. In the seventeenth century, from 1860 to 1867, the amount of customs duties reduced or repealed has amounted to upwards of 10,000,000l., while the amount collected has increased from 5,000,000l. to 13,500,000l. The methods, system, and situation of the Excise have been improved, and the necessity of allowing drawbacks on soap used in certain textile manufactures entailed fraud and occasioned great loss to the revenue. It is evident that "considerations of revenue" alone prevented the duty on paper being similarly dealt with.

There were three different rates of duty in the United Kingdom on home-made spirits, and this antiquated mode of dealing with the article led to smuggling. An approximation was therefore made in 1853 towards their equalisation by raising 1d. per gallon to the duty on Scotch spirits, 6d. on Irish spirits, reserving to an early period the further advancement of the principle of equalisation. This was accomplished, as far as regards Scotland, in 1855, by advancing the duty on the excise to 8d. in the gallon. This measure at once relieved the borders from a block to a multitude of excise officers. At the same time the duty in Ireland was raised so as to bring it to so near an approximation, that smuggling almost ceased to be remunerative; and in April, 1858, Mr. Disraeli, the Chancellor of the Exchequer, in his budget proposed an entire equalisation. Another great object of the Budget of 1853 was to establish a general uniformity of taxation in the three kingdoms under another important head, by rendering Ireland liable to the income-tax, and to accustom the Irish mind to the idea of the Exchequer being willing to make a great sacrifice. He remitted a sum of 4,500,000l. due from Ireland to England, constituting an annual charge of 245,000l., four-thirds of which was to be continued for forty years. He swept away this debt, and committed the charge in consideration of an addition of 8d. per gallon on Irish spirits, and the income-tax for seven years. Ireland had been exempted...
from this tax in 1845, in consideration of a duty of 1s. additional on spirits, and an augmentation of stamp-duties; but the first was abandoned almost as soon as enacted, and the second disappeared in 1850, when a reduction of stamp-duties took place both in this country and Ireland. Exemption from the tax, however, was still conceded to the income-tax or the revenue; as, for example, Great Britain had borne the income-tax, and Ireland had largely participated in the remission of duties which that tax was designed to supply. When, therefore, further benefits were to be placed within reach by assenting to the income-tax for a period of seven years, it was felt to be just in principle to impose the tax on Ireland, which would otherwise derive advantages at the cost of the people of England and Scotland. The complex system of the assessed taxes, levied under separate acts of Parliament, was replaced with one view of securing simplicity and uniformity. With this object the progressive plan of assessment has been abolished, also compositions, and, as far as possible, exemptions.

Some important alterations have been made under the head of Stamps. Penny receipt-stamps have been substituted for stamps of varying value, in order to obtain the advantages of uniformity, and to remove the temptation to evasion; and the facilities of trade have been promoted by allowing the penny receipt-stamps to be used in connection with bankers' cheques, so as to add to their security. [Stamps, S. 2.]

The most important portion of the Budget of 1853 was undoubtedly the new tax on successions, which subjects every succession to a tax from Great Britain of 5 per cent. From the income-tax, it was alleged, pressed unequally on intelligence and skill, as compared with property, and the succession-tax was designed to adjust the balance. Real property, which was assessed by the Inland Revenue, had been exempt from legacy duty. This feudal claim of exemption permitted an estate in land of 50,000L. a year to pass to the heir without his contributing one farthing to the state, while a poor man who received a legacy of 100L. paid a tax of 10L. The anomaly has now ceased, and a person who succeeds to a landed estate of 10,000L. is taxed on the annual value of his property, which, on the principle of calculation adopted, gives a rent of 300L. a year.

The income-tax was retained, but was associated with remissions of indirect taxation to an amount exceeding 5,000,000L.; and its extinction was finally provided for in 1860, on the ground that it is not well adapted to form a permanent portion of ordinary public income. It is like the reserve of an army, which should only be brought forward to avert general dangers or accomplish important objects. It may reconcile those who dislike the inquisitorial nature of this impost to consider what it has effected under the opposite conditions of war and peace.

During the years which lasted, with two brief intervals, from 1792 to 1815, there were three periods, in the first of which there was no income-tax; in the second it was only incompletely adopted; and in the third it was fully brought into operation. From 1793 to 1796 there was no income-tax. The charge of government, and the charge of debt incurred before 1793, together with the cost of war, amounted on the average of these six years to 36,000,000L. a year. The revenue, with all the additional taxes laid on, amounted to 20,500,000L., leaving an annual deficiency of 15,400,000L.

In 1798, the income-tax was imposed by Mr. Pitt, and from 1799 to 1803, the cost of war and public charges rose from 37,904,000L. to 47,327,000L., the revenue, aided by the income-tax, rose from 20,500,000L. to 33,700,000L., and the annual increase of expenditure, amounting to 11,400,000L., a year, the excess of expenditure over revenue was less by 2,000,000L. a year during these four years than from 1793 to 1798. From 1803 to 1815, the income-tax was in full force. The expenses of the war and of government, and the charge of debt (9,500,000L.) incurred before 1793, amounted to 65,794,000L., but the revenue rose to 63,700,000L. The annual deficiency, instead of being 18,400,000L., as in the first period, or 11,400,000L., as in 1798, was only 1,200,000L. Omitting the charge of debt incurred before 1793, there was actually raised, during the heaviest period of war expenditure, 7,000,000L. a year more than the charge of the war, as against the want of war.

If the resolution to submit to an income-tax had not been adopted at an earlier period, the national debt need not at this moment have existed. Rightly, therefore, is it regarded as an auxiliary, to be reserved for great occasions. In re-imposing the income-tax for seven years, the intentions of the government were to mark it as a temporary measure, to equalise, as far as possible, its pressure on skill and intelligence as compared with property, to mitigate its operation by every rational means compatible with its integrity, and so to make it a tax not on personal but on productive income; and on these terms it was accepted for the sake of the benefit which it brought in its train.

The Government, after giving the most mature consideration to the nature and circumstances of the state of the nation, to the duration of the tax, and staked their official existence on the success of their general financial plan. The Chancellor of the Exchequer showed that the incidence of the tax on real property was already heavier than was generally supposed, and he was altogether unable to say whether the tax was a tax on the pound, and that evasion or unfair assessment was impossible; while on trades and professions the principle of self- assessment entailed extensive frauds, of which he gave a striking instance. It was necessary to compensate twenty-eight persons for their profits for a single year, and they claimed 145,590L.; a jury awarded 26,973L., but their return of profits for assessment to the income-tax was only 9,000L. The case of the professions, which has often been brought forward as one of peculiar hardship, appears when analysed to be of less magnitude than the public have been led to believe. They do not contribute more than one-twentieth part of the tax; but to mitigate their case as far as possible, persons who insure their lives up to one-sixth of their income for ten years are released from taxation. They are not required to take out an insurance, but not so as to escape the tax altogether; and this will chiefly benefit the professions to the amount probably of 120,000L. a year.

The remission of the income-tax to Ireland has already been noticed. The tax has also been extended at a lower rate of assessment to all persons with incomes between 100L. and 100L. a year. They were benefited by all the remissions of taxation, which had been purchased at the cost of others by the payment of the tax. In 1846 further remissions were to be made, it was only just that this exemption should cease. The Chancellor of the Exchequer added cases showing, that persons with incomes between 100L. and 100L. a year, had been benefited by the reduction of duties on necessaries and luxuries to a greater extent than whose incomes varied from 160L. to 170L. a year; the first to the extent of 6 and 7 per cent., and the second to only 5 per cent., or deducting the payment by them of income-tax of 2 per cent. On the other hand, the cost of the tax in Russia, the tax was raised to 16d. in the pound on incomes of 150L. and upwards, and to 11d. on farms rented to that amount; it was reduced to the original 7d. in 1857; and to 5d. in 1858.

"Considerations of revenue" alone prevent the further application of this tax to the financial principal of the fiscal system. The duties on paper and wine, and particularly those on fire-insurance, are amongst the first which have claims to be abolished or reduced, and which promise great benefits when released from taxation to be productive of the greatest advantages to the community. The advantages against one of the very best principles of society—that of distributing losses which would ruin an individual, over the whole community, in a manner to render it scarcely appreciable by any. An exemption from the tax only shows its impolicy. Farming-stock and implements do not pay insurance duty, but a workman's tools do. The tax, however, yields upwards of a million to the Exchequer, and the Chancellor cannot afford to give it up.

Much has been accomplished, more than could possibly have been anticipated a few years ago; and we will conclude by quoting the closing sentences of Mr. Gladstone's most able speech on introducing the Budget in April, 1853, as a fair statement of the principle which now regulates the fiscal system: "While we have sought to do justice, by the changes we propose in taxation, to intelligence and skill, as compared with property; while we have sought to do justice to the great labouring community of England, by further extending the principle of taxation by the payment of the tax guided by any desire to put one class against another; we have felt we should best maintain our own honour — that we should best meet the views of Parliament, and best promote the interests of the country—by declining to draw any invidious distinction between classes, and claim for ourselves as a sacred aim, to diffuse and distribute—burden if we must—benefit if we may—with an equal and impartial hand; and we have the consolation of believing that by
proposals such as these we contribute as far as we lies, not only to develop the material resources of the country, but to knit the hearts of the various classes of this great nation yet more closely than heretofore to that throne and to those institutions under which they are happy to live."

As intimately connected with the ameliorations of our financial system, we append a list of the taxes repealed or reduced, and of taxes imposed or increased during the following years:

REVIVOR. [Socr Faciis, S. 2.]

RHAYADER. [RANDOMBER.]

RHENEITE. [MINEALOGY, S.1.]

RHINOPOMA. [CHRYSTOPTA.]

RHIZANTHE. Rhizants, Rhizogons, a small class of Plants, comprising the orders Balanophoraceae, Gymnaceae, and Rafflesiacae. They are parasitical plants, destitute of true leaves, in place of which they are furnished with cellular scales. Their stem is either an amorphous, fleshy, or a ramified mycelium, and is very imperfectly supplied with spiral vessels, which are sometimes wholly deficient. They are of a brown, yellow, or purple colour, never green. They produce flowers which have genuine stamens and carpels, and are surrounded by a whorl of petaloid bodies. They possess ovules, but their seed is not known.

These plants have been regarded by Lindley, Endlicher, and other botanists, as sufficiently distinct to warrant their being placed in a class by themselves. Their flowers, stamens, and ovules, indicate their relation to the phanerogamic plants, whilst their mycellial stem, parasitic habits, and cellular structure ally them with the Fungh and other low forms of vegetation. Mr. Brown however is of opinion that the Rhizantes are but less developed forms of Exogenous Plants. He regards them as having affinities with Aristolochiacae, and other orders of Exogens. More recently Mr. Griffiths has adopted the views of Brown, and advanced
a number of arguments in favour of their being degraded forms of higher plants, and not a permanently low form of vegetation. He thinks the relations of Rhizantha various. Thus he places Mystropetalon near Protaceae and Santalaceae; Sarcoptolepis and Balanophora he places near Urticaceae. Finally, he places Thesium between Taccaceae and Burmanniaceae.

The following are the orders of Rhizanthae as recognised by Lindley:—

Ovules solitary, pendulous; fruit one-seeded; 
Balanophoraceae.

Ovules 00, parietal; fruit many-seeded; 
Calyx 2-4-6-parted; anthers opening by slits.

Cytinaceae.

Ovules 00, parietal; fruit many-seeded; 
Calyx 5-parted; anthers opening by pores.

Rafflesiaceae.

RHIZOBOLACEAE, Rhizobolus, a natural order of Plants, consisting of trees of very large size. The leaves are opposite, digitate, coriaceous, with a pointed stalk and no stipules; flowers large, regular, arranged in racemes, with their stalks pointed at the base and below the apex; the sepals are 5 or 6, more or less combined, imbricated in aestivation; petals 5 to 6, equal-sided, but unequal thickish, arising along with the stamens from a hypogynous disc; fruit of several combined indistinctly one-seeded nuts; seed reniform, exalbuminous, covered with a spongy excrecence; radicle very large. The species are confined to South America. They are large timber-trees, some of which yield edible oil. It is from trees of this order that are produced the Soanai (or Suawar) Nuts of the shops, the kernel of which is one of the most delicious fruits of the nut kind that is known. An oil is extracted from them not inferior to that of the olive. The timber of the tree is used for ship-building.

(Lindley, Vegetable Kingdom.)

RHIZOBIACEAE. [Mabberley, s. 2.]

RHIZOPHERACEAE. [Buisson.] RHIZODITA, A Mineral resembling Boracite [Borax] in its crystals, but it tingles the blow-pipe flame deep red. It occurs with the Red Tourmaline of Siberia. (Dana.)

RHODYMENIACEAE, an order of Algae, consisting of purplish or blood-red Sea-Weeds, with an expanded or filiform inarticulate frond, composed of polygonal cells, occasionally traversed by a fibrous axis; superficial cells minute, irregularly parted, or rarely disposed in filamentous series; fructification double; cotyledons external or half-timbered, thick globose or hemispherical, imperforate, containing beneath a thick pericarp a mass of spores affixed to a central placenta. The root is disc-like or branched, somewhat matted; from the frond arise many stems, either leafy or filiform, and much branched, never articulate; in some an intense scarlet, in others, in brown-red or purple, usually growing somewhat darker in drying. The species are very few and very difficult; all our genera having representatives in very distant countries and climates. Rhodymenia is an ill-defined genus, and will probably be divided into several distinct genera. Many of the species, especially of the section Calophylla, are among the most splendid and showy of our seaweeds, and among them, as R. Hombrowniana, are clothed in royal purple; while others, like the sober dulse of our coasts, R. palmata, have often as much of brown as of purple in their attire.

Many of the Rhodymeniaceae are valuable in an economic sense. R. palmata, the Dulse of our coasts, is collected largely in Scotland and Ireland, and forms an important article of diet. Many of the Gracilariae are largely used in the East as ingredients in soups and jellies, and as substitutes for glue. One of them G. spinosa, is the Agar Agar of the Chinese, and is largely collected both for culinary purposes and as a component part of some of the strongest Chinese glues. It has recently been imported into England, and is occasionally used instead of carrageen moss in making jellies and blanccmanges.

(Harvey, British Alga.) RHYDDLLAN, or RHUDDLLAN. [Fluntshire.] RHYTHM, [vars.]

RICCIACEAE, a natural order of Moss-like Plants or Herbs, inhabiting mud or water, swimming or floating, usually annual; their leaves and stems blended into a front of a cellular structure, creeping, green or purple underneath, with a distinct epitropous, and a cavity of air-passages beneath it in some species.

These plants form a plain transition from Thallogena to Acrogyros. Their spores are collected in large numbers within organs resembling the piliils of Phaeogamous Plants. They may be fixed by the axis of growth, and an epidermis is distinctly formed with stomates for breathing with. The genus Duriaea is regarded as forming the nearest transition to Liverworts. It fructifies under water, which is very seldom the case with the other Cryptogams.

Of the species of Ricciaceae there are two-thirds that have been observed in Europe, and the remainder in various parts of the world. Several species in North America, the Cape of Good Hope, and Brazil, appear to be very similar to those of Europe, but differ in genera and species.

RINGWOOD, Hampshire, a market-town, and the seat of a Poor-Law Union, in the parish of Ringwood, is situated on the left bank of the river Avon, in 50° 50' N. lat., 1° 47' W. long., distant 57 miles S.W. from Winchester, 92 miles S.W. by way of Salisbury, and 17 miles from the W. road, and 40 miles N. from Southampton and South-Western railway. The population of Ringwood parish in 1851 was 3928. The living is a vicarage in the archdeaconship and diocese of Winchester. Ringwood Poor-Law Union contains 45 parishes, and township and female at the expense of of 16,425 acres, and a population in 1851 of 5465. The town is lighted with gas. The manufacture of thread and woollen gloves employs some of the inhabitants. The chancel and transepts of the parish church appear to have been erected about 1320; the nave and tower are more recent. There are chapels for Wesleyan Methodists, Independents, and Unitarians, and National schools. There is an excellent corn-market, held every Wednesday. Fairs for horses and cattle are held on July 10th and December 11th. Richmond is the nearest market, and can be reached by road, and by the railway from the west. The most eminient of the writers of the newspaper press in London, was a native of Scotland, and was born in 1787. Of the history of his boyhood little is known. He was probably born in Leith or in Edinburgh, and was availed himself of the opportunities afforded by the grammar-schools of Scotland to acquire a well-grounded education. His first known entry into public life was as editor of the 'Dundee Advertiser,' a weekly newspaper, somewhere about or a little before 1813. In this paper he at once evinced those remarkable powers of condensation and arrangement by which his after labours were distinguished. The paper advocated liberal, or rather the Whig, principles of the day, at that time by no means generally received in Scotland, though somewhat more favoured in Dundee. He made a very considerable impression on the talent he displayed not only ensured the popularity and success of the newspaper, but procured him the support and friendship of many of the leaders of the Whig party in Scotland. As editor he was the architect of the constitution and the close corporation of the town; the advocate for the improvement of the burgh schools; for the extension of harbour accommodation; and the expounder of fiscal mismanagement. About 1825 his connection with the 'Dundee Advertiser' was terminated, but he was not disposed to give up the field. With friends he commenced 'The Spectator,' of which he was absolute control, and of which the first number was issued on July 5, 1825. He had now an opportunity
realising his notion of what a newspaper should be; and no
man ever worked harder, more conscientiously, or more
independently to effect his object. We have already
noticed his faculty of arrangement, which he thoroughly carried out
in The Spectator. Besides writing on a multiplicity of sub-
jects himself, he secured the services of a number of
well qualified and distinguished men as contributors; but in
most cases he suggested the subject, and in all he critically
examined every one of their productions before they appeared
in print. He was a supporter, through the paper, of the
greater freedom of political discussion, of the timely
establishment, and probably few newspapers have had
so much influence in forming opinions, particularly among
the more highly educated class, as 'The Spectator.' The
freedom which was given to criticising the king, his
excesses; the absence of all exaggeration or deprecation of facts; the
recognition of objections or defects in matters where an approval
was given of the whole; though sometimes seeming to give
an air of coldness to his judgments, and occasionally even of
indifference, aided the influence by exciting thought.
For thirty years he continued this laborsious and useful life up to
within a month of his death, which occurred on April 29,
1765.

RIOJA, LA, one of the provinces of the Argentine
Confederation, comprehends the country between the Gran
Salinas and the Andes, and extends from north to south from
28° to 31° S. lat. It is bounded S. by the provinces of San
Juan and San Luis, E. by Cordova, N. and W. by Cat-
umarens, and on the E. by the republic of Chili. The area is
5850 square miles. The population is variously estimated
from 15,000 to 25,000.

The country is described generally under PLATA, LA,
STATES OF. It consists of a narrow strip of cultivable land
along the eastern base of the Andes, the two valleys of Fatamansa and Guadacual, and a pastoral tract extending round the southern extremity of the Sierra de Velasco. Only the northern districts of the country east of the Sierra Fatamansa are fit for agriculture. The province is bounded N. by the province of Arauco, W. by the provinces of Arauco, Fatamansa, Guadacual, and the Llalao of Arauco lies east of the Sierra de Velasco, and produces wheat, maize, and cotton; but its principal wealth is its vineyard. From 7000 to 10000 barrels, of 16 gallons each, of a strong sweet wine, called Chilenio, is produced. The city of Fatamansa is on the whole of which is exported to Cordova and the neighboring provinces.

The capital, La Rioja, is also that of the whole province. Fatamansa lies to the west of Arauco, between the Sierra de Velasco and the Sierra Fatamansa. It contains rich deposits of coal, and is one of the most important of the 13 towns of the province. About 6000 barrels of wine annually. This department takes its name from the Sierra Fatamansa, celebrated for its mineral wealth. The silver-mines of Fatamansa are very rich, but the remoteness and insecurity of their situation—being above the line of vegetation, and only accessible by
difficult mountain-paths—have hitherto prevented them from
being worked except on a small scale. The capital, Chilecto,
is a place of no importance. Goitre prevails to a fearful
tensity in the valley of Fatamansa. Guadacual lies between the
Sierra Fatamansa and the Andes, and produces very rich
crops of wheat. It is thinly inhabited, and chiefly by abori-
gines, who hunt the vicuna in the adjacent mountains. The
wool of the vicuna is the only article of export. Guadacual,
though not exactly a port, is a central place of the province,
consisting chiefly of a desert plain, containing a great number
of grassy oases, on which there are numerous cattle-farms.
About 20,000 head of cattle are annually reared. Like the
other provinces of the Argentine Confederation, La Rioja is
under national, owning a qualified dependence upon the
central government. The state government is nominally
vested in a governor and municipal junta of five members.

La Rioja, the capital of the state, is situated at the foot
of the Cordillera, and contains the usual suburban
buildings. It contains some substantial houses, a few public buildings,
the only school in the province, and about 3000 inhabitants.

RIPLEY. [Yorkshire.]
ROCAMBOLE [Alicante.]
ROCABRULAC ACID. [Chemistry. S.1]
ROCHEA (named after La Roche, a French Botanist), a
genuse of Plants belonging to the natural order Crassulaceae.

It has a 5-lobed calyx; petals 5, united into a gamopetalous
hypocephalous corolla, with a short tube, equal in length to
the spreading limb or shorter than it; stamens 5, alternating
with the petals, a little exserted; glands and carpels 5.
The species are fleshy simple succulent shrubs. The leaves
are thin, oblong, acute, ciliate at the base, thin, and white. The
flowers are disposed in terminal corymbs, without any bracts.
A large number of the species are cultivated in our gardens and
greenhouses.

ROGER WILLIAM SAMUEL, was born on the 30th of July 1763,
at Newington Green, a suburb of London. His father, who
was a Dissenter, and much respected by the Dissenters
of London, was a banker by profession; and the poet, after a
careful private education, was placed, when yet a lad, in the
hands of the house of Humphrey Bonham, who, for a time, was
his partner. Among the reminiscences of this time was that
of Wilkes calling at the banking-house to solicit his father's
vote, and, as his father was out, shaking hands with him as his
father's representative. From a very early period, the
future poet exhibited a taste for letters, and he used to date
his first determination towards poetry from the effect pro-
duced upon him by reading Beattie's 'Minstrel' when a mere
boy. His admiration of literature and literary men led him,
who still a clerk in his father's bank, to meditate a call on
Dr. Johnson. On one occasion, when his friend, Dr. Bonham,
met with a young friend, he went to Johnson's house in
Bolt Court bent on accomplishing the object, but his courage
failed him when he had his hand on the knocker. It was in
1783 that Roger, then in his twenty-third year, published his first volume of
poetry under the title of 'An Ode to Superstition, and some other
Poems.' The date is important. 'The commencement of a
new era in British Poetry,' says a critic, 'dates almost ex-
actly with the publication of this volume, which appeared before 1783, the
years in which there had been manifestations of a new poetic spirit, differing from
that of the poetry of the 18th century as a whole, and more
particularly from that of Darwin, Hayley, and the Della
Cruccas, who represented the poetry of the 18th century in
its latest and greatest manifestations.' Roger himself, who pub-
lished his 'Library' in 1781; and Cowper had made his first
distinct appearance as a poet in 1782, when he was already
in his fifty-second year. Crabbé's 'Village' was published
in 1783, and Cowper first made an effective impression the
year before 1783, in 1782, in the second volume of his
great work, in which he published his 'Task,' in 1785.

Thus Rogers was heard of as a poet almost at the
same time as Crabbé and Cowper. But more exactly con-
temporary with Rogers than either Crabbé or Cowper was
the poet Campbell, whose 'Ode to Mary, Countess of
Exceter,' was published in 1783. The following year, of 1785,
that year, 1785, which saw Rogers's 'Library as an author.'
In short, Rogers's 'First appearance as a poet coincides with
the opening of that era in our literature in which we still are,
and of which Rogers himself is one of the minor
stars. Although Rogers died very young, he lived long enough
in France, where he saw Condercot and many other men after-
wards celebrated in the French Revolution. He also visited
Scotland, where he saw Adam Smith, Dr. Robertson, and
William Robertson, in 1768. His own critical sentiments
were those of moderate Whiggism, but this did not prevent
men of all parties from being his guests.
In 1812, Rogers, when his name seemed dead, added to a republication of his earlier poems, the fragment entitled "Columbus." He was then in his fiftieth year. In 1814 his "Jacqueline" was published in conjunction with Byron's "Lara," this being the period of the height of the intimacy between the two so dissimilar poets. "Composed with the same skill as the other poems," it was pronounced "of the highest degree of smoothness," says the writer of a sketch of his life, "his "Human Life" appeared in 1819. Finally, as the last and much the longest of his productions, came his "Italy," the first part of which was published in 1822, in the poet's sixty-sixth year, and the complete edition of which, illustrated, under the author's care, at an expense of 10,000l. by Stothard, Proot, and Turner, did not appear till 1836. With the preparation of this exquisite book his literary career may be said to have ended; he was still the author of occasional copy of verses at the rate of a couple a week; and some of these trifles, including one written as late as his ninety-first year, are preserved in his collected works. But on the whole it was in his character as a supernumerary poet, living on the reputation of his past performances, drawing the artists and wits, and men of rank of a more modern age around him, and entertaining them with his caustic talk, and his reminiscences of the notable persons and events of former days, that the public was least of all enlightened in the disjointed history of his last twenty years of his existence." The longevity of the poet was, indeed, one of the sources of the public interest felt for him in his later life. Always fond of open air exercise and of going to public exhibitions, he might be seen strolling about the fashionable quarters of the city, or lounging at the opera, to within a few years of his death. An accident in the streets at last disabled him from walking out; but the extraordinary tenacity of his constitution enabled him to recover from it, when a second stroke of paralysis seized him, and left him alone among a generation of juniors.

Rogers will be remembered partly for his poetry, and partly from the peculiar connection in which he stood, in virtue both of his longevity and his social position and habits, with the miscellaneous phenomena, and especially with the art and literature of his time. His poetry is of the highly finished and tasteful rather than the powerful kind. "We have in his works," says a critic, "a classic and graceful beauty; no slovenly or obscure lines; fine cabinet pictures of soft and mellow hues, and occasionally trains of thought and association that awaken or recall tender and heroic feelings." His relations to his time were less those of active influence than of broad and genial remembrance. They are best exhibited in the "Table Talk," published since his death, by his friend Mr. Dyce.

ROME. [MINERALOGY. S. 1.] ROSE-WOOD. [TRIPTOCOLIA. S. 2.]

ROSE, REAR-ADMIRAL SIR JOHN, Knight, was born June 24, 1777, at Balsaroch, Wigtownshire, Scotland. He was the fourth son of the Rev. Andrew Ross, of Balsaroch, minister of the parish of Inch. He entered the navy as a first-class volunteer November 11, 1790, on board the Prince, 22 guns, and served in the Mediterranean till 1799. From November 7, 1790 till 1791, he served on board the Impregnable, 98 guns, in the English Channel. After being some years in the Baltic, in 1802 he became a midshipman on board the Wessel, sloop-of-war, which in that year formed part of the expedition to the coast of Holland. After having served on board several other king's ships, he received his commission as lieutenant, March 13, 1805. While attached to the Sirius, 16 guns, in 1806, he was severely wounded in four places in cutting out a Spanish vessel under the batteries of Bilbao, for which, in 1806, he was granted a pension of 924l. a year, increased in 1815 to 125l. a year. He was several times of commission, and was appointed to the Brises, sloop-of-war, and afterwards to other vessels, till the termination of the war in 1815, during which period he performed several services. He married his first wife in 1816.

In 1820 he married Miss Fanny, daughter of Captain Driver, sloop-of-war, in Loch Ryan, on the coast of Scotland, he received a copy of Sir George Hope, one of the Lords of the Admiralty, informing him that two ships were to be sent out, to "ascertain the existence or non-existence of a north-west passage;" and inquiring whether he was disposed to undertake the command of the expedition. Having expressed his willingness to do so, he was directed to repair to London, where he arrived on the 30th of December. On the 13th of January 1818, he was ordered on board the 385 tons, Lieutenant W. E. Parry being appointed to the command of the Alexander, 252 tons. The two ships departed from the Thames, April 25, 1818. They sailed up the eastern side of Davis's Strait and returned by the other side. They entered Lancaster Sound, and after proceeding some distance up it, Ross and the officer of the watch thought that they saw "land round the bottom of the bay, forming a chain of mountains connected with those which extended along the north coast. The height of the supposed slow-moving vessel, was a considerable distance behind the Isabellas. Parry however and his officers could see no mountains, and were greatly surprised and disappointed when the Isabellas turned her head eastwards, and gave the signal for the Alexander to follow the example. Ross named the supposed high land the Croker Mountains, and has laid them down in his chart as a continuous chain closing up the bottom of the supposed bay. This was a mistake, as Parry believed at the time it was a passage opening into the sea; and the latter entered through Lancaster Sound into Barrow's Strait. [Parry, Sir William Edward, S. 2. The ships arrived in the Thames on the 14th of November, 1818. On the 7th of December, the same year, Ross was sent north, as captain of his Majesty's sloop-of-war, A Voyage of Discovery, made under the Orders of the Admiralty, in his Majesty's ship Isabella and Alexander, for the purpose of exploring Baffin's Bay, and enquiring into the Probability of a North-West Passage, 2 vol. 8vo.]

After the unsuccessful attempt of Captain Parry to reach the north pole, in 1827, Captain Ross submitted to the Lords of the Admiralty and to the Lord High Admiral the plan of another voyage of discovery to the Arctic seas. The government undertook to equip the vessel, and Captain Ross undertook to command the expedition. A new steam-ship was equipped at the expense of Mr. Felix Booth (afterwards Sir Felix Booth), then sheriff of London. The ship was named the Victory, and was fitted with an engine, invented by Mr. Brown of Mears, Braham, and Co., which proved to be so bad as to be almost useless. Commander James Clark Ross, nephew of Captain Ross, was chosen as second in command. They had an attendant vessel of 16 tons burthen, granted to them by the Admiralty, and undertook to bear the expenses of the expedition. They had a steam-ship, the British Victory, of 100 tons burthen, and a steam vessel, H.M.S. Fury, had been wrecked. The Victory and the Krusenstern entered the Inlet on the 12th of August, and on the following day discovered the wreck of the Fury. They afterwards proceeded south, as they returned, along the coast of Asia, and on the 8th of October were frozen up in Felix Harbou, on the west side of the Gulf of Bouchia. They were not released from the ice till the 17th of September 1830, and were able to advance but a very short distance before they were again frozen up on the 31st of October. On the 29th of August 1831, the Victory was again released from the ice, but on the 20th of September was forced by the pressure into another harbour. In April 1832, they sailed into Kuskokwim Bay with sledges and provisions, and on the 29th of May the vessels were finally abandoned. Captain Ross, in his journal, observes, "In the evening I took my own adieu of the Victory. It was the first vessel that I had ever been obliged to abandon, after having served about his majesty's service in the course of forty-two years." Some of the crew had died, and the rest were much weakened, but they struggled on till the 15th of August 1833, when the ice broke, and they were enabled to return to the coast of Asia. On the 17th of October, after the entrance of Lancaster Sound, they came in sight of the Isabellas, which was out on a whaling voyage. The mate in command of a boat that was sent to them, on Captain Ross asking him the name of the vessel, said it was the Isabellas. On the 18th of October, they came in sight of the Unashaws as they all were, dirty, dressed in tattered skins, and wasted almost.
to the bones, the man doubted the statement, and said that Captain Ross had been dead two years. He was easily convinced of his error, and they received on board the Isabella, with the bones and inscriptions, and with three hearty cheers. The Isabella arrived at Hull on the 18th of September, 1833, and on the 19th Captain Ross reached London by steamer.

Most of the bones were frozen up in the Gulf of Boothia, many journeys and surveys were made by Commander Ross, and some by Captain Ross himself, chief of the coast and the country which they named Boothia Felix. During one of these journeys Commander Ross discovered, June 1, 1831, a species of Plane which bore the name of Plane 'Celebrated,' which has the name of Plane 'Celebrated,' and which was not published, and which was not published.

The ship, which was one of the little case or tube, in which they live, but this must not be confounded with their proper envelope. When the loria is soft the animal has considerable power of elongating and contracting its body, as seen in the cuticular tube or tube, which is connected with pincer-like organs, to enable them to remain stationary whilst feeding. Those which form tubes are usually fixed.

The rotatory organs, or wheels, are fleshy retractile lobes, covered with vibratile cilia, and are capable of being contracted or extended, or both, and which are fixed to the tegumentary system, and also to that part of the digestive system connected with the rotatory organs. The Ehrenberg has given the name of 'gills.' This system of vessels is regarded by Mr. Huxley and other observers as a true squeruous or water-vascular system. Connected with the respiratory apparatus, according to Ehrenberg, is an organ projecting out into the water, which has been called the 'calcar,' or 'siphon,' or ' respiratory tube.' Ehrenberg describes it as a tube, and supposes currents to pass from it. It is connected with the nervous ganglion. Dujardin and Huxley have not observed either currents or an orifice in this organ.

All observers agree that the Rotifera possess a nervous system, which presents itself in the form of a pair of cephalic ganglia, from which proceed nervous filaments. The extent of the development of the nervous system is a subject for further inquiry. The red spots which Ehrenberg calls eyes are subject to considerable variations in appearance. Mr. Huxley says he observed them in young Lacinularia, not in adult individuals.

The exact number of species in a species of Notommatia has been clearly made out by Mr. Brightwell of Norwich. The male however is much smaller and less developed than the female. All observers agree that the parts to which Ehrenberg has given the name of 'gills' are not fixed in certain caudate bodies have been described by Kölliker as Spermatotomes, but their nature is doubted by other observers. Mr. Huxley describes in Lacinularia certain 'vacular thickenings,' which he suggests have been previously mistaken for blood vessels. Only three or four species are generally made out in most of the species. The ova are of two kinds. Mr. Huxley says in Lacinularia they consist, first, of bodies which resemble true ova in their origin and subsequent development, and which possess only a single vitelline membrane; second, of bodies half as large again as the foregoing;
which resemble the epiphitum of Daphnia; like it they have altogether three investments, and which do not resemble true ova either in their origin or subsequent development; while the latter are the subject of much discussion.

Professor Williamson has described very fully the development of the true ova in Melicorta virgata, from which it appears that the young are hatched do not pass through any of those larval changes which are characteristic of animals both higher and lower in organisation. All the changes which take place occur in the ovum.

The position of the Rotifera in relation to the other forms of animal life has been the subject of much discussion. Dr. Grant was one of the earliest writers to take them out of the Radiata, and place them amongst Articulata. The relation of such forms as Stephanoceros to the Ciliophryaceae Polyplacophora is very evident. In his Memoir on Lacinularia, Mr. Huxley gives his reasons for regarding these creatures as permanent larval forms of Echinoderma. After referring to the various forms of Rotifera, and their homologous organs, he thus concludes:

"We may say, therefore, that the Rotifera are organised upon the plan of an Amniol larva, which loses its original symmetry by the unequal development of various regions, and especially by that of the principal ciliated circle or trochaial band; and it is curious to remark that, as far as the class of animals considered, it is the most equally balanced of all (though the outline is in an extreme degree of an animal which seems to me to throw so clear a light upon the position of the Rotifer in the animal series. In a Report which I have endeavoured to harmonise the researches of Professor Müller upon the Echinoderms, 'Annals of Natural History,' 1851, I have shown that the same principle is applicable to the last of these larval states, and hence I do not hesitate to draw the conclusion (which at first sounds somewhat startling) that the Rotifera are the permanent larval forms of Echinoderms, and hold the same relation to the Echinoderms as the Hydroid Porphyra hold to the Medusae, or that Appendicularia holds to the Ascidians.

'The larva of a Sipunculus might be taken for one of the Rotifera; that of Ophiura is essentially similar to Stephanocerus; that of Astasia resembles Lacinularia or Melicorta. The pre-trochical processes of the Ascidian larvæ Brachiolaria are equivalent to those of Brachiophora.

'Again, the larva of some Ascidian forms and of Comatula are as much articulated as any Rotifera. It must, I think, have struck all who have studied the Echinoderms, that while their higher forms, such as Echinus and Sipunculus, tend clearly towards the dicoidal Ascidia, the lower extremity of the series seemed to lead no-whither.

'Now, if the view I have propounded be correct, the Rotifera furnish this wanting link, and connect the Echinoderms with the Nereididae and Nematoiid worms.

'At the same time it helps to justify that breaking up of the class Radiata of Cuvier, which I have ventured to propose elsewhere, by showing that the Rotifera are not 'radiate' animals, but present a modification of the Annuloide type—belong, in fact, to what I have called the Annulida, and form the lowest step of the Echinoderm division of that sub-kingdom.'"

Dr. Leydig, in a paper in the 'Zeitschrift für Wissenschaftliche Zoologie,' vol. vi., on the other hand, regards the relations of Rotifera as much more with the Crustacea than with the Worms. The points of resemblance to which he draws attention are:

1. Their external figure and hard tegument, which more nearly resembles the carapace of the Crustacea than the rings of the Appendicularia.

2. Their muscular structure, which resembles that of many Crustacea.

3. Their nervous system resembles that of many Entomoptera, as Daphnia.

4. The alimentary canal resembles that of Daphnia.

5. The resemblance in the character of their ova, the Entomoptera having two kinds of ova, as the Rotifera.

6. The development of Rotifera and Entomoptera Crustacea corresponds.

Leydig concludes a very able paper by proposing to call the Rotifera Ciliated Crustacea.

With regard to the arrangement of the Rotifera, that of Ehrenberg, which is exceedingly defective, has been given under Rotatoria. From the previous observations on structure and function it will be seen that this arrangement is open to many objections.

Dujardin, who was one of the earliest observers that pointed out the defects of Ehrenberg's arrangement, has proposed the following:

Order I. Siptolidae—Fixed by a pedicle.
Family 1. Fisculariaceae.
Family 2. Melicortiaceae.
Order II. Swimming Siptolidae.
Family 4. Fisculariaceae.
Family 5. Albidaceae.
Order III. Siptolidae—Alternately swimming and fixed.
Family 6. Rotifera.
Order IV. Crawling Siptolidae.
Family 7. Tardigrades.

Leydig has proposed an arrangement of his own, which is preferable to either of the above.

Ciliocrustacea.

Animals with a jointed body and a ciliary apparatus at the cephalic extremity. The nervous system consisting of a cerebrum and a ganglion and filaments radiating from it. Digestive and respiratory systems much developed. No heart or blood-vessels. Sexes separate. The female produces 'summer-ova' and 'winter-ova'; many undergoing metamorphosis.

A. Figure between claval and cylindrical.

I. With elongated transversely-ridged attached Foot.
1. Fisculariaceae, Ehrenberg: F. ornata, Ehr.; F. appendiculata, Ehr.
2. Stephanoceros Eichhornii, Ehr.; S. glacialis, Perly.
3. Oxites crystallinens, Ehr.
4. Conchilia vortex, Ehr.
5. Lacinularia socialia, Ehr.
7. Tubocolia nojas, Ehr.
8. Melicorta virgata, Schrank.

II. With elongated jointed Foot, retractiles, like a telescope.
1. Calocordia elegans, Ehr.; var. C. rosae, Perly; C. cornuta, Perly.
2. Hydractia corythes, Ehr.
3. Tylaphila viridis, Ehr.
5. Actinurus neptunius, Ehr.
6. Monolobus conicus, Ehr.

III. With elongated jointed non-retractile Foot.
1. Scardinius longicaudus, Ehr.
2. Dinokarias Focilium, D. tarentula, D. pampaura, Ehr.

IV. With a short Foot and long Pedal Forceps.
1. Notomata (); N. tripus, N. longistria, Ehr.
3. Fiscularia gibba, P. Forfeica, P. gracillia, Ehr.
4. Microdon clavus, Ehr.

V. With short Foot and Pedal Forceps, which are of equal length with or somewhat shorter or longer than the Foot.
1. Hydatina senta, H. brachydactyla, Ehr.
2. Pleurotomba gibba, P. constricta, P. logenia, Ehr.
3. Fiscularia Rheinhardtii, Ehr. (probably not a Fiscularia, but a Notomata).
7. Systoma bidentata, S. balica, S. oblunga, S. cornuta, Ehr.
8. Diglena grandis, D. forcipata, D. aurita, D.

ROY, Thomas, F.R.S., was born September 15, 1776, at South Elmham, near Bectes, in Suffolk. His father was the Rev. Peter Routh, who was rector of South Elmham from 1753 to 1764, when he resigned it for Bectes. In 1774 he became the rector of Bectes grammar-school. In 1788 he became, after his father's death, under his father, matriculated as a battier at Queen's College, Oxford, May 31, 1770, but in July, 1771, was elected a dey of the college of St. Mary Magdalen. Having taken his degree of B.A., he became a Fellow July 1776, and on the 23rd of October, in the same year, took his degree of M.A. In 1781 he was appointed college librarian; in 1783 he was elected senior proctor of the university, and in 1784 junior dean of arts. He proceeded B.D. July 16, 1786, and in 1789 was elected one of the college bursars. He was elected president of Magdalen College April 11, 1791, on the resignation of Dr. Horne, bishop of Norwich. Dr. Routh's first literary publication was an edition of the Euthydemus and Gorgias of Plato, 'Platonis Enithydemus et Gorgias,' in 12mo. A Latin Latin. A Latin emendation by Josephus Routh, A.M., Collegii D. Mariam Magd. Oxon. Socitae, 1805, 3vo. Having taken his degree of D.D., Dr. Routh in 1810 became rector of Shoreditch, near Reading, in Berkshire, whither he used to retire occasionally for the benefit of his health, and to enjoy the vacation allowed him by the statutes of his college. In 1814 he published the first two volumes of his 'Reliquie Sacre: sive Auctoriarum jam Perdicionum, Secundi Tomi Post Christianae Temporis.' The third volume was published 1820, 8vo. The third volume was published in 1816. In 1820 he married Eliza Agnes, daughter of J. Biggar, Esq., of Chalcot Park, near Tylershurst. In 1823 he edited Bishop Burnett's 'History of his own Times.' In 1826 he published 'Scripulorum Ecclesiasticorum Omnia,' 8vo, and a second edition in 1840. In 1843 he published an improved edition of Burnett's 'History of his Own Times.' In 1846 appeared four volumes of a new edition of the 'Reliquie Sacre,' to which he added a fifth volume in 1848. He died December 22, 1854, at the age of ninety-nine, and was buried in the vault of the chapel of Magdalen College.

ROYLE, JOHN FORBES, M.D., a distinguished botanist, was educated for the medical profession, and was a pupil of the late Mr. Todd, of Exeter College, Oxford. He acquired that love of botany and taste for materia medica for which he was afterwards so distinguished. After passing the usual medical examinations in England, he entered the service of the East India Company. In Hindostan he worked with great diligence in the collection of plants, and especially in acquiring a knowledge of their medical properties and history. He wrote a work 'On the Antiquity of Hindoo Medicine,' in which he included a great amount of valuable information on the subject of the practice of medicine among the Hindoos. Having spent a large portion of his time in the Himalayas, where he was superintendent of the East India Company's botanic garden at Sathanpooor, he was enabled to form a large collection of plants, and to make observations on the medicinal properties of many plants. On his return to England he published his great work, entitled 'Illustrations of the Botany and other Branches of the Natural History of the Himalaya Mountains.' This work, which appeared in parts, was commenced in 1839, and finished in two volumes 4to. It contained a large amount of valuable information on the natural products of India, especially those which are useful in medicine and the arts. Although Dr. Royle did not practise medicine, his knowledge of drugs and their properties made him a popular person for the chair of Lecturer on Materia Medica at King's College, London, a position he occupied till the year 1866. The results of his experience in this department of knowledge were incorporated in a volume entitled 'Manual of Materia Medica,' which has been since the time of its publication a text-book in medical schools. Dr. Royle's botanical knowledge was often employed on the productive resources of...
India. He several times read papers on the cultivation of
tea and cotton in India at the meetings of the British
Association for the Advancement of Science. His activity at
those meetings led to his appointment for a short time as
co-secretary with General Sabine of that association. In
1840 he published an 'Essay on the Productive Resources
of India.' In 1855 he also published a volume on 'The
Fibrous Plants of India,' pointing out those which could be
made more especially available for the manufactures of Great
Britain. He took an active part in the Great Exhibition of
1851, especially in arranging the East Indian department.
He was a Fellow of the Royal and Linman societies,
and held an appointment in London in connection with the
East India Company. He died January 2, 1888, at his resi-
dence, Heathfield Lodge, Middlesex.

In respect to race, the Baron gives the following approxi-
mations in round numbers:-

1. Slavonic races—Russians, 49,000,000; Poles, 6,500,000;
Lithuanians and Lettis, 3,000,000; Bulgarians and Illyrians,
500,000; total, 55,000,000.

2. Other races—Germans, 650,000; Dacian Romans (Wal-
lach), 750,000; Tchudes, 3,400,000; Tartars, 2,150,000;
Mongols, 250,000; Munusheus, 100,000; Hyperboreans,
200,000; Caucasian tribes, 2,750,000; Greeks, 700,000;
Jews, 1,800,000; Gipiates, 30,800; Miscellaneous, 50,000;
total, 13,000,000.

The revenues of Russia, of which we have no recent
return, amount to about 350,000,000 silver rubles, of which
45,300,097 silver rubles were derived from the domains
of the crown. The debt in January, 1864, amounted to
1,042,465,179 silver rubles. (The value of the silver ruble
is about 3s. 4d.)

The state of the army and navy of Russia, in the year
1867, is given in the article MILITARY AND NAVAL FORCES,
&c. 2.

RUSTCHUK, a fortified town in Bulgaria, capital of an
eyalet in European Turkey, is situated near the right bank
of the Danube, about 40 feet above the level of the river,
40 miles S. from Bukharest, and has a population variously
estimated at from 50,000 to 40,000. The Danube opposite
Rustchuk is nearly two miles wide, but its surface is broken
by a number of islets and shallows, and the banks are low.
From a distance Rustchuk has an agreeable appearance,
with its white chimneys and graceful minarets, rising up
from among the foliage of extensive orchards. This impres-
sion however is removed by a view of the interior, which
presents dirty ill-paved streets, flanked by low wooden
houses, most of which stand in little courtyards or gardens.
The Pasha's konak, or palace, and the mosques, are the only
buildings worth notice. The town has baths, a bazaar,
and about 3000 houses; it has also some trade with Vienna in
cloth, indigo, corn, wine, &c. A harbour for river craft is
formed below the town by a small recess of the river, which
is sheltered towards the north-east by a cape crowned by
a bastioned citadel. Rustchuk is commanded by heights to
the south-west, on which five detached bastioned earth-works
have been recently thrown up. The town itself is surrounded
by an earthen rampart, which presents eight bastioned fronts,
revetted half-way up with masonry, and surrounded by a
moat and counterscarp. The front towards the river is
irregularly fortified. The Russians took Rustchuk after
ehormous losses of men in 1811; it opened its gates to them
in the invasion of 1828. The fortified enceinte of Rustchuk
measures four miles. On the left or Wallachian bank
of the Danube, opposite to Rustchuk, is Giurgevo, which
was originally the fortified tête-de-pont to Rustchuk. Its
defences were razed in carrying out the treaty of Adrianople,
but have been since repaired. A ferry connects the two
places. A tall clock-tower stands in the principal square.
One of the islands in the Danube is fortified. A pentagonal
fort built with stone defends the harbour. Beyond this fort
the town of Giurgevo is built; its enceinte presents a semi-
circle towards Wallachia. Giurgevo trades with Austria in
the produce of the country, and has about 7000 inhabitants.
In the wars between Russia and Turkey, Giurgevo has been
frequently the scene of hard fighting between the two nations.
The Russians took it in 1711, and completely defeated the
Turks in the vicinity the same year; they took it again in
1810. The Russians occupied Giurgevo in 1854, and were
defeated by the Turks under its walls on July 7 of that
year.

RUTHEN. [DUNSBURGH.]
RYDE. [WIGHT, ISLE OF.]
SABADILENA. [CHEMISTRY, 1.]

SACCHARIC ACID. [CHEMISTRY, 1.]

SACCHARITE, a Mineral resembling granular felspar, of a greenish-white colour, and with the constitution of Leucite. It is found in Silesia and the Carpathian Mountains.

SACCHULMIC ACID, SACCHULMIN. [CHEMISTRY, 1.]

SACLASTIC ACID. [CHEMISTRY, 1, under Mucic Acid.]

SACRAMENTO CITY, the capital of Sacramento County, State of California, United States of North America, is situated on the left bank of Sacramento River, at the confluence of American Fork, in 39° 34' N. lat., 121° 40' W. long., about 100 miles N.E. from San Francisco. The city was founded in the spring of 1849; in 1850 it contained 6820 inhabitants, of whom only 474 were females; and at the State Census in 1852 the population was above 10,000.

Sacramento City owes its origin to the discovery of gold, which gave so remarkable an impetus to California generally. It was on the south branch of American Fork, about 50 miles from Sacramento City, that gold was first discovered. The growth of the city was, from its foundation, remarkably rapid. In April 1849 there were only four houses on the site; in the following year it was a large and regularly laid-out town of nearly 7000 inhabitants. The city stands in the midst of a fine farming country, and about 30 miles from the commencement of the gold diggings. Occupying a low site, it has been found necessary, in order to protect it from inundations, to which it is liable in the rainy season, to construct a levee along the bank of the river. The streets of the city cross each other at right angles; those running east and west are designated by the letters of the alphabet, and those running north and south by the numerals. Many of the streets are lined with oak and eucalyptus trees, some of large size, imparting a considerable degree of picturesque ness to their general appearance. The city contains Episcopalian, Protestant, and Roman Catholic places of worship, and ten manufacturing churches, schools, numerous stores, above 150 eating saloons and hotels (some of which are of a very costly and splendid character), several steam-mills, and a few manufactories. Like San Francisco, Sacramento City has suffered severely from several very destructive fires; but the parts of the city which were destroyed have always been quickly rebuilt, and generally in an improved style. Several daily and weekly newspapers are published here. Regular daily communication is maintained with San Francisco by steam-boats.

SADDLEWORTH. [YORKSHIRE.]

SAGUINUS. [Sagoin.]

SAGUS, or SAGUERUS, a genus of Plants belonging to the family of Palmae. The leaves are pinnate; the flowers monoecious, racemose; the fruits are spathes, but with numerous partial ones; the fruit hard, shining, its surface divided into numerous rhomboidal spaces. The species are natives of the islands of the Indian Archipelago, and yield sago.

S. Laevigatus, the true Sago-Palm, has the petals and spathes unarmed. This palm furnishes most of the sago sent to Europe.

S. Rumphii has the petals and spathes guarded by strong prickles. According to Martin, the sago yielded by this plant is used principally in India, and seldom exported.

SAINT-Arnaud, MARECHAL LEROY DE, was born in Paris, of poor parents, on the 20th of August 1798. Having entered the Royal Body-Guards at the age of sixteen, he rose to the rank of sub-lieutenant in the infantry of the line in 1818. Owing to some youthful vagaries, he left the army shortly after, and embraced the theatrical profession, when he first performed at the suburban Théâtre des Batignolles. In 1819 he returned to the army, and served at Toulon in 1821, but the revolution of July revived his taste for martial life; he returned to the army in 1831, and having entered the 64th regiment as sub-lieutenant, was made full lieutenant within six weeks. The insurrection of the partisans of the Duchesse de Berry afforded him the opportunity of earning the favourable notice of Marshal Bugeaud. He was subsequently appointed to the charge of the citadel of St. Blaye, where the Duchesse de Berry was confined—a post in itself, from the circumstances, somewhat painful to an man, and his conduct in it incurred for him considerable odium.

In 1836 Saint-Arnaud was sent to join the army in Algiers, with the rank of captain; he behaved with much gallantry at the siege of Constanti na, and received the decoration of the Legion of Honour. The brilliant courage he displayed in these campaigns obtained for him the rank of commandant of the 18th regiment in 1839. In 1841 he was appointed to an important dis posi tion induced him to quit it to enter the Zouaves the same year. In 1842 he was created lieutenant-colonel; and in 1844, on the recommendation of Bugeaud, he became colonel of the 92nd regiment. During the next three years he was constantly in the field; his reputation increased, and he was made major-general in 1847. In 1850 he was appointed to command the province of Constanti na, which was then in a very unsettled state; but he subdued the whole country within the year. In the early part of 1851 General Saint-Arnaud was despatched on an expedition against the Kabylies, which was entirely successful, and was considered one of the most brilliant campaigns of the French in Algeria. His little army did not amount to 7000 men, and with this he overran that rugged country, and in spite of a desperate resistance he conquered the whole province. This was the service which fixed upon him the attention of the President of the French Republic.

Saint-Arnaud returned to Paris in the autumn of 1861, as general of division. Louis Napoleon at once took him into his confidence, giving him the command of the second division of the army of Paris immediately after his arrival, and then appointing him minister of war. He acted cor rectly while the Prussian war was over. On the return of his mother, November 19, 1851—"nothing in this world is wanting, but to go straight forward and be bold." In the famous coup d'etat of the 2d of December following he was the President's chief adviser and instrument. Honours now accumulated upon him; he was made marshal of France, then a senator, and received the grand cross of the Legion of Honour in 1852. His health had gradually declined under so harassing a life; yet he so strongly solicited the command of the French army intended for the east, at the time wrote of the war with Russia, that his request was granted. The events of that war are so well known that we need not dwell upon them. It will be enough to say that Marshal Saint-Arnaud entered upon it with the utmost eagerness. He evidently felt that a splendid chance was afforded of professional distinction. For a time his impetuosity enabled him to bear up under his constantly-increasing malady. The landing in the Crimea, which he calls his "favourite idea," he tried to make the utmost of; but as his life was ebbing, he insisted on forward movements, regardless of the opinions of his colleagues. On the morning of September 20, 1854, Marshal Saint-Arnaud mounted his horse with great difficulty, and by the constant exercise of great spirit sustained all the fatigues of command during the battle of the Alma. He exhibited the same energy in his despatch after the victory, but the intensity of his feelings is only fully seen in his letters to his wife, published in the collection referred to below. But the effort proved too much for his remaining strength; his malady increased daily, and on the 27th he was obliged to embark on board the Berthollet to return to Constantinople. He died on the 29th of September, 1854, whilst yet on his passage.

The career of Marshal Saint-Arnaud, from just up to the outbreak of the Russian war, shows him too much in the light of a daring and not very scrupulous adventurer; and he did not live long enough, when a noble field was opened to his ambition, to show whether he possessed the abilities and patience of a great military commander. But, even earlier, he exhibited the most brilliant and dashing courage, combined with judgment and energy, devotion to his duty was never so strongly evinced as at the close of his career.

Two volumes of his letters, written to his brother, Lettres du Marechal de St.-Arnaud, Paris, 1855, which, though exhibiting many suppressions, give much curious information respecting the last twenty-five years of his remarkable career.
SAINT HYACINTHE. [Canada, S. 9.]

SALICARIA, a genus of Birds belonging to the family Sylviculta, and separated by Mr. Selby from the genera Locustella and Sylvia. "The rounded form of the tail," says Mr. Yarrell, "the outer feathers being much shorter than those in the middle, and the partial lacing or pencilling, are marks to distinguish this species. It is common in the Sedge and the Reed Warblers, appear to separate them from the Sylvicula Warblers." There are four British species of this genus.

S. locustella, the Grass-hopper Warbler, is so called from its connection with its insecticidal habits. It is a note. It comes to this country from the south, and appears about the middle of April, and departs in September. It is a shy bird, keeping at the bottom of a hedge, and creeping along more like a mouse than a bird. It feeds on small snails, slugs, and caterpillars.

S. phragmitis, the Sedge-Warbler, Sedge-Bird, is found during the summer in thick patches of reeds or willows, in marshes, or on the low sides of rivers, or on islands. Like the last, it is a summer visitor, arriving in April and leaving in September. White of Selborne first observed its power of imitating the notes of other birds, as well as of its occasional singing at night. It measures 4½ inches, and is somewhat a l-s-a bird than the last.

S. flammea, the Reed-Warbler, Willow Locustella. It is a rare bird in this country, but like the group to which it belongs, it frequents moist and shaded situations, among reeds and bushes, near water.

S. cinerea, the Reed-Warbler, the Night-Warbler, the Reed-Wren. It is always found in company with the Sedge-Warbler, but is not so numerous in this country as that bird. It arrives here in April and departs in September. It sings usually in the day, but sometimes at night. "The character of the note, the entire absence of the buoyant white stripe over the ear-coverts, and the uniform colour of the whole of the upper surface of the body of this bird, distinguish it from either the Grass-hopper-Warbler or the Sedge-Warbler, with both of which however it has many habits in common." (Yarrell: [Yarrell, History of British Birds].)

SALICIN. [CHEMISTRY, S. 1.]

SALOP. [Shropshire.]

SALT, in general. [Chemistry, S. 1.]

SALTA, the most northern of the provinces of the Argentine Confederation, South America, extends between 22° and 30° 30' S. lat., 60° 1' and 68° W. long. It is bounded S. by the province of Tucuman, E. by the Gran Chaco, N. and W. by the republic of Bolivia. The area is about 60,000 square miles; the population is about 60,000. It has been described generally under Plata, La, and we therefore only add the following more recent information.

SALTA is remarkable for its soil and climate, rapidly increasing from extreme heat to the most intense cold, permitting the cultivation of almost every kind of natural production. But the country is too thinly peopled, the difficulties of transit are so great, and the habitants have too little money to look forward to the advantages of commerce.

SALVADOR, the capital of the republic of Salvador, is a port of entry to the gold coast of Africa. The city is about 10 miles from the sea, and is situated on a spit of land. It contains about 10,000 inhabitants. It has a fine harbor, and is a port of call for ships bound to the interior of the country.

SALVADOR, NARCISSE-ACHILLE, COUNT DE, was born at Vienne, in the department of Gers, June 11, 1793, but was sent to Paris in early youth, and educated at the lycee Napoleon. He enlisted as a volunteer in 1812, and served with so much distinction during the campaigns of 1813-14, that on the 5th of April, 1814, the emperor bestowed upon him, with his own hands, the decoration of the Legion of Honour.

After the restoration of the Bourbons, in 1814, M. de Salvador was made an officer of the royal household; and in March 1818, attended Louis XVIII to the frontiers. About this time, in his twentieth year, he began that long series of argumentative pamphlets, for which he afterwards became celebrated, by the publication of two brochures, one called "Memoire sur les Grèves et les Vols," and the other "Memoire sur le Changement de Mere," in 1815, and brought out "La Coalition et la France," in which he displayed considerable talent. It produced a great sensation in more than one country.

In 1827, he became a member of the conseil d'etat, holding the office of Maitre des Requêtes. But he was incapable of submission to any control. The measure presented by M. Barthelemy, on the "Loi des Electeurs," appeared to him an organic change unfavourable to the constitution; he therefore published his "Vues Politiques," in which, regardless of place and eloquence, he fully described the nature of political parties, their power, influence, and objects. This act of independence was followed by several others, as the restoration of the Bourbons was to be advanced upon public liberty, until the starting pamphlet "Sur les Dangers de la Situation presente," produced a rupture between him and the ministry.

In 1834 M. de Salvador went to Spain, and shortly afterwards married Madeleine Oberkampf. The result of this journey was a work of more than usual length, "Don Alonso, ou L'Espagne," comprising a full account of the Peninsula, and its various political changes. It was in the course of preparation that he fell ill, and began to write his well-known articles in the "Journal des Debutants," the paper which at that period were entitled "Les Funerales de Louis XVIII," and "Le Nouveau Regne et Ancien Ministere," recommending a course of constitutional policy to the popular representatives. His independence and conscientious independence of political writers, he steered a middle course between the opposite parties, and flattered neither of them. Ever constant to his principles, and equally averse to arbi-
trary rule and anarchical divisions, he maintained for forty-two years the same moderate opinions of equity and justice. In all his writings he took for his basis the maxim—that there is no authority beyond the constitutional monarchy. His style is energetic, and his arguments are expressed in warm language; yet he never abandons the fundamental principle; notwithstanding the strong measures adopted by the French government to embarrass him, especially by the revival of the war;

In 1837, during the short liberal ministry of M. de Martignac, M. de Salvardy was created Conseiller d'Etat, on which occasion Charles X. said to him: "You must admit that it is a great honor, M. de Salvardy, to have been appointed to the office which you now hold, at the head of the Polignac cabinet, was formed, in 1829, he resigned immedi-
ately.

From 1830 to 1848, during the whole reign of Louis Philippe, M. de Salvardy continued to publish his separate pamphlets, and of accusations heaped upon him; in all of which he had the Polignac cabinet formed, in 1829, he resigned immedi-
ately.

From 1830 to 1848, during the whole reign of Louis Philip-
From 1830 to 1848, during the whole reign of Louis Philip-
From 1830 to 1848, during the whole reign of Louis Philip-

markable scenes which were subsequently witnessed in the town, or city as it had now come to be designated, its rapid expansion in every direction, the reckless habits and almost extravagant mode of life, and the increased size and population, are too familiar to need more than a word of reference. Nor

less well known are the terrible confusions which have so
often lain large portions of the city in ruins, to be however restored with surprising rapidity to far more than its previous condition, the streets are so wide and spacious that it is possible, upon the repair of the destroyed places on a larger, more costly, and substantial scale.

The magnificent bay of San Francisco, on which the city and its environs is described, is one of those many, out of which the streets are now tolerably well paved, and many of them are laid with
planks; well lighted, and watched; and arrangements have been made for their sanitary supervision. Several of the public buildings and churches are comparable with those in coast of the United States. The bay holds the United States, and is
so entirely in a transition state, that the most accurate account of to-day would be inapplicable a few months hence. Besides the churches there are several schools, general and
wine hospitals, and numerous benevolent institutions. The water is excellent and abundant and abound with every variety of articles of necessity and luxury. The hotels are among the most noticeable features of the place as it now is, and some of them are carried on in a very costly manner. There are also numerous eating and drinking saloons, theatres, concert-rooms, lyceums, and other places of amusement or dissipation, including not a few gaming-houses of various grades. The manufactures of the city are comparatively inconsiderable.

The commerce of San Francisco is very great. The bay, which is 8 miles wide, affords excellent anchorage, and is the natural outlet, not only for the almost unparalleled mineral riches of California, but of a district the extreme fertility of which has as yet hardly begun to be developed. The city fronting the bay is now lined with wharfs and quays, and vessels of great burden can lie alongside to land and take in their cargoes. Steamers are in regular and con-
stant communication with New York and the Atlantic ports, and with all parts of the Pacific. The extent of the commerce of San Francisco have been given pretty fully under CALIFORNIA, S. E., and it is needless to repeat the details here. In the years subsequent to that there given, there has been a considerable, though fluctuating, increase in this traffic. At the time of our last visit departing at San Francisco, but the returns are informal and incomplete. The annual clearances of shipping from the port at present, average about 600,000 tons; the entrances somewhat less. The amount of gold dust annually shipped from San Francisco exceeds in value $50,000,000 dollars. Up to the close of 1853 there had been deposited at the United States mint and branches, gold from California amounting to 207,316,177 dollars, nearly all of which had passed through San Francisco; besides which a very large quantity has been received in this country and elsewhere direct from San Francisco.

Coal is found near the city; and there are quar-
ries of good limestones. Eight or ten daily and several
weekly newspapers appear in the city.

SAN JOSE. [CALIFORNIA, S. E.,]

SAN JUAN DE LA FRONTERA, one of the provinces of the Argentine Confederation, South America, extends between 39° 30' and 32° 8' lat.; 67° 30' and 70° 20' W. long. It is bounded S. by the provinces of Mendoza; E. by that of San Luis; N. by La Rioja; and W. by the republic of Chili. The area is about 40,000 square miles. The population is estimated at from 35,000 to 36,000.

The province lies to the north of Mendoza, which it re-
sembles in its cereals and productions. [PLATA, LA,
States of.] The surface of the country is described generally under PLATA, LA. extending along the eastern declivity of the Andes, San Juan comprehends the northern part of the Vale de Uspallata, and a large portion of the plain which separates the Paramilla range from the mountains of Cordova,
and contains the Lakes of Guanacache. The Vale of Upalata is barren and nearly uncultivated. The soil of the plain consists of sand, and is without grass, but covered with stunted prickly trees of the mimosa kind. It is quite barren, and produces no kind of grain or vegetables, except where it is cultivated by the small share of water which some of its minor affluents. This irrigation renders the land exceedingly fertile; without any other manure, they produce most plentiful crops of wheat and maize. The ordinary crops are wheat and maize, whose produce is however not very great. Like the other provinces of the Argentine Confederation San Juan is a federal state, owning little dependence on the central government. The executive power is vested in a governor, elected by the junta, or provincial assembly.

San Juan, the capital of the province, is situated on the Rio de San Juan, in 31° 4' S. lat., 66° 57' W. long. pop. about 7000. It contains the government house and other public buildings and has considerable commerce, being the most important port on the eastern coast. The province is not richly stocked with industries and the produce is largely exported, and from which foreign goods are distributed to the interior. In 1833 the city was nearly destroyed by an inundation of the Rio de San Juan, by which three churches and several houses, with cellars for potatoes, were thrown down, and many of the inhabitants lost their lives.

San Luis de la Punta, one of the provinces of the Argentine Confederation, South America, extends between 24° 42' and 25° S. lat., 56° 27' and 57° 23' W. long. It is bounded N. by the province of Buenos Ayres, E. by Cordova, S. by the province of Buenos Ayres, E. by Cordova, S. by La Rioja, N.W. by San Juan, and S.W. by Mendoza. The area is about 36,000 square miles. The population is about 200,000.

The country included within this province is described under PLATA, States of. It comprehends that immense tract of country which extends between the provinces of Mendoza on the west and Cordova on the east. Its northern part runs northward to the border of the Great Salina, and it reaches southward to the country of the Ranquel Indians, but now claimed by the province of Buenos Ayres. No part of it possesses any considerable degree of fertility. The greatest number of the widely-spread estancias is the cattle-farms, which, as a result of most of the property is held in large estates, or cattle-farms, occur along the road leading from Buenos Ayres to Mendoza, in the hilly country, where tracts of grassy land alternate with ridges of hills and sandy deserts over which the herds of cattle wander. As the ground is generally flat and the pastures are indifferent; still cattle, horses, mules, and sheep are abundant, and are exported to a small amount, together with some wool. The corn and maize which are raised are not sufficient for the consumption of the scanty and widely-scattered population. The country between the Sierra de Cordova on one side, and Mendoza and San Juan on the other, is still worse. As no fresh-water stream runs through it, it cannot be irrigated; and with the exception of a few gardens, it is a complete desert; this climate is dry and hot; rain seldom falls. The gold-mines of La Carolina are about 60 miles N. from the city of San Luis, have ceased to be worked; but the people of the village silt the alluvial soil at certain places in the neighbourhood, and collect annually a small quantity of gold in dust and small lumps (peplis). Like the other provinces of the Argentine Confederation, San Luis is a federal state; the executive power being vested in a governor elected by the junta, or provincial assembly, but in many years has there been no really effective government.

San Luis de la Punta, the capital of the province, is pleasantly situated on the western slope of a hill, 2417 feet above the level of the sea, in 33° 17' S. lat., 65° 45' W. long.; but it is situated on a sterile slope of a basin-like depression, and does not contain more than 1500 inhabitants. There is no other place in the province above the rank of a hamlet.

San Paulo, the capital of the province of San Paulo, Brazil, South America, is situated on two of the head streams of the river Tiete, in the plain of Piramistins, at an elevation of 2464 feet above the level of the sea, in 23° 33' S. lat., 46° 45' W. long. The population is about 22,000, exclusive of the suburbs. San Paulo is one of the oldest towns in Brazil, having been founded by the colony of Port tuaque in 1660. The city of San Paulo is situated on two banks of houses with two stories, built of 'taipa,' which is a frame-work of wood filled in with earth. The public buildings are—-the palaces of the governor of the province, formerly a Jesuit college, and the house of the Scheffer, a spacious cathedral, and church of the Carmelites; a college, schools, etc. The only manufacturing is a government establishment for making fire-arms. Some coarse woolen cloths and hats are made. San Paulo is the general emporium of the commerce of the plain in Brazil, and the trade on which is chiefly based on coffee, sugar, rum, jerked beef, hides, horns, tallow; the manufactured goods of Europe and North America are imported. Santos, the port of San Paulo, is 42 miles S.W. from the city; and the distance to so steep that nearly all goods are carried on the backs of mules.

San Quentin. [California, S.E.] San Salvador, Republic of, of Central America, extends along the Pacific Ocean from the Bay or Gulf of Conchagua to the Rio de Paz. It lies between 12° 10' and 14° 15' N. lat., 86° 45' and 89° 45' W. long.; and is bounded E. by Nicaragua, N. by Honduras, W. by Guatemala, and S. by the Pacific Ocean. The area is about 8680 square miles. The population is about 300,000.

San Salvador, in proportion to its size, is the most populous, of the republics of Central America. The surface is very unequal. The main portion of the coast extends along the Pacific in a generally west-north-west and east-south-east tract of low and generally level land; from 10 to 12 miles wide; but farther north, up to Sonsonate, the coast is more elevated and broken. The interior is very rugged, being broken by several short ranges of mountains of moderate height, but separated into distinct districts.

The islands of San Salvador have only a short course, and are in their natural state of little importance; though it is asserted that they might easily be rendered of great service for irrigation, and some of them be made navigable for barges and other small craft. The chief river is the Lempa, which rising in Esequilbas, in Guatemala, forms a short distance the boundary between Honduras and San Salvador, and turns the course of the Lempa, which forms the Lempa Estuary, in the direction, and flows into the Pacific a little to the westward of the Bay of Guasique. It is a deep but rapid stream, and the bar at its mouth prevents vessels of even moderate burden from entering it. The other larger streams are the Rio de Paz, at the western extremity of the republic, the Jiboa, which falls into the sea between the Lempa and Port Libertad; and the Sirama, or San Miguel, all of which have their mouths obstructed by sand-bars. There are two lakes of some size in the state, the Lakes of Nixaca and Maudina, in the western boundary. The Lempa has a circuit of about 80 miles, and is one of the principal feeders of the Rio Lempa. It is said to communicate by a subterranean channel with the much smaller Lake of Metape, about 25 miles west of the capital, and 900 feet below the level of the sea. San Salvador, about 9 miles long and 3 miles wide; its only exit is a small tributary of the Jiboa. Mineral-thermal springs occur very numerous in various parts of the country.
Owing to the great inequality of surface, there is considerable variety of climate. As a whole, it is warmer than in Guatemala; but it is generally regarded as healthy. The hottest and least healthy part is the low tract along the coast.

San Salvador has great agricultural capabilities. The soil is generally good; and in some parts remarkably rich, and the climate permits a considerable variety of crops to be profitably cultivated. The inhabitants are industrious and enterprising. Of all the cities of Central America, it is the most important in the northwestern parts of Central America. Nearly all the available land in the country is appropriated to individuals, and much attention has been paid to its cultivation, though now, from the loss of the sheep, the cattle raise the cultivation of the land. Agriculture is in a very neglected condition. Maize is the principal crop; sugar, cotton, coffee, tobacco, and cotton succeed very well, and might, were the country in a more settled state, be raised largely for exportation. Since the gold discoveries in California, a very large quantity of sugar has been grown in the country, and Sonsonate, chiefly for the purpose of distilling rum for the Californian market. Indigo has however always been the chief resource of wealth to San Salvador. During the Spanish supremacy, upwards of 1,800,000 lb. are said to have been annually exported, and even the quantity raised has greatly fallen off, it is still considerable. The coast west of Point Libertad is commonly known as the Balsam Coast, it being the only place where the article known as the Balsam of Pecora is collected. This part of the country is rich in gold; it is the centre of the peccary trade, and is inhabited by a number of Indian villages, who have their own chiefs, with a kind of municipal government, and subsist chiefly on the products of the balsam, which they collect to the amount of about 15,000 to 20,000 lb. annually, and distribute among themselves. They also cut and carry to Sonsonate a considerable quantity of camphor-wood. There are large forests on the slopes of the mountains of the interior.

Cattle are numerous, and a good breed; sheep do not succeed very well; horses are everywhere abundant. Turkeys and fowls are plentiful; but there are few ducks and geese. An inferior kind of cheese is made in large quantities; butter is seldom made.

The mineral wealth of the state appears to be considerable, but it has been very imperfectly developed. Gold has been obtained in several places. Some rich silver-mines were formerly worked, but, owing to the general insolvency of the state, they have been for many years almost entirely neglected. Gold is now obtained near Metapa. Lead and copper have also been found.

The only manufactures are of the common articles of domestic consumption. They consist chiefly of coarse cotton goods, cutlery, and iron ware, and some of them used to be in considerable demand abroad; but the present state of the foreign trade of comparatively little importance. The exports in 1853 amounted in value to 700,000 dollars; the imports to 1,260,000 dollars.

San Salvador has divided into four departments, which are named after their respective capitals—San Salvador, San Vicente, San Miguel, and Santa Anna. In all, the republic contains 6 principal towns, 143 smaller towns, and 62 villages. The following are the more important places; the population is given in parentheses.

San Salvador, the capital of the republic, is situated on the Rio de Atilchate, a small affluent of the Lempa, in 13° 44' N., 87° 58' W. long. The city is of the size of 2000 feet above the level of the sea, on undulating ground, in a kind of valley, surrounded by high hills covered with wood, among which, in a north-eastern direction, and at a distance of about nine or ten miles, is the volcano of San Salvador, which at different periods has caused great devastation to the city. The city possesses considerable regularity, and had in the centre a plaza, or square, three sides of which were lined with shops, with porticoes before them, supported by a colonnade; while on the fourth side was the cathedral, an edifice which had no greater dimensions than a small chapel, containing about 20,000. But on the night of the 16th of April, 1854, the city was entirely destroyed by an earthquake, and a very large number of the unfortunate inhabitants killed. For several days previous to the sad catastrophe there had been slight tremblings of the earth, but they caused no mischief; little heed was given to their premonition. On the evening of the night named however the shocks became more frequent and severe, and, being unattended with noise, the inhabitants became seriously alarmed, and many assembled in the great square. At length, at about ten minutes to eleven o'clock, a violent heaving motion of the earth occurred, which in a few seconds levelled the cathedral, churches, university, and every other public building in the city. At the same time much of the population were in their houses, and were at the very moment of being killed when these were rendered uninhabitable; and the wells and fountains were either filled or dried up. Many of the inhabitants, as we have said, perished, and of the survivors many fled to other towns and villages. The city now lay desolate for some time after the fatal night; and the president of the republic, in his address to the departments calling on them to assist the destitute citizens, intimated that measures were to be immediately taken for the selection of a better site on which to rebuild the city. Some manufactures of iron, especially of cutlery and coarse cotton stuffs, were carried on in San Salvador; and some sugar and indigo used to be exported. Sugar-plantations are numerous in the neighbourhood, as are also extensive orchards. Messmates, or lajinas, as they are called, here constituted the bulk of the population. Near the city there are some warm and some cold rivulets, which afterwards unite, affording the inhabitants the advantage of having natural baths of every degree of temperature.

San Miguel, some distance east of the Rio Lempa, population about 7000, is noted for its fair, of which the most important is held in November after the indigo crop.

San Vicente, on the right bank of the Lempa, contains about 2000 inhabitants. It is noted for the extensive extent of its suburbs. In the neighbourhood are extensive plantations of indigo, and near the village of latapexco excellent tobacco is grown, which is known under that name all over Central America.

San Anna, situated in the western extremity of the state, at a considerable elevation above the sea, population about 9000, has in its neighbourhood extensive plantations of indigo and sugar; in the mountains near the town are iron-mines, which were formerly profitably worked.

Sonsonate, near the western extremity of the state, population about 8000, carries on at present considerable commerce by means of the port of Acajutla, exporting sugar to Peru and Chili, and rum, &c., to California. The Indians inhabiting the country about the town make very beautiful mats, which are also exported. In the neighbourhood of Sonsonate is the Ysalco, a very active volcano.

Other towns of less importance than those above mentioned are—Aquachapa, Apatzcape, Cojutpeque, Metapa, Zacatecol, etc.

San Salvador is a republic with a legislative chamber of 25 deputies, but the government is really vested in the president. The history of San Salvador is similar to that of the other republics of Central America. [Costa Rica, S. 2; Guatemala, S. 2; Honduras, S. 2; Nicaragua, S. 2; Panamá, S. 2] Of the republic of the United States of Central America, San Salvador became one of the federal states, and its capital was made the seat of the federal government; but the union was speedily dissolved, and San Salvador, like the other states, became an independent republic, and like them its progress has hitherto been arrested by constant internal discord.

Juarros, Historia de Guatemala; Hazekne, Reis naar Guatemala; en Central America; Baily, Central America, &c.

SANA is the capital town of the province of Yemen in Arabia, situated in 16° 5' N. lat., 44° 5' E. long. Sana, though the chief town of Yemen, is the seat of an independent chief, the Imam of Sana, who exercises authority over a wide district around, and with the Egyptian government, which has advanced its frontiers to Beit-el-Falik, a town in the Jehameh, about midway between Sana and the port of Mokha, on the Red Sea. Sana is a town of some 2000 inhabitants; it is built in three sides by higher mountains. The valley thus formed is about nine miles broad, but extending uninterrupted to the north. The country round about supplies a considerable quantity of coffee, which at present is transmitted to Mokha by camel. The coffee is excellent, and the coffee trade is so great, that it has been considered likely that the traffic may be turned to Aden, to which port Sana is as near as to Mokha. Coffee forms almost the only export; the imports are piece-goods, thread, and twist, Persian tobacco,
glass, silk, spices, and sugar. The town is walled, and
indiscreetly fortified. It is about 46 miles in circumference,
with narrow streets, but with many good houses; those of
the more opulent having windows of stained-glass. The
imam has two handsome palaces, both built of hewn-stone
and fortified, in the town, and there are about twenty
modern palaces, some of which have fountains and public
fountains. Across the principal street a handaxe bridge
has been thrown, as in rainy seasons a torrent runs down
the street, but occasionally the town is seven years without
rain. The popula-
tion of the town is about 3,000; of those three neighboring
towns in the same valley, Rodah, Wady-Drar, and Jeraf, the
population is at least 30,000 more. In Sana, and probably
in the other towns, the principal part of the artisans are
Jews, who supply the town for restorers of the towns:
they live in a quarter by themselves, and their number is
about 3000. (Geo. Journal, vol. viii.; Journal of
Mr. J. C. O. Cristenden to Sana, 1833.)

SANFRENCES [GALICIA.

SANDWICH. [CANADA, S. E.

SANDGINARINE. [CHEMISTRY, S. E.

SAMILICA, a genus of Plants belonging to the natural
order Umbellifera and the tribe Saliaceae. The calyx has
5 leaf-like teeth, about 
, with a long flex-
cindent convex point. Fruit sub-globose, covered
with hooked spines; no ridges; vittae numerous.

S. Europe, the Wood-Sandich, is a native of Great
Britain, in woods and thickets. The lower leaves are pal-
mate,桑, lobed, and unequal nervate. The flower

SANTA FE, one of the riverine provinces of the Argent-
in Confederation, South America, has been described under
Plata, La, (vol. xiv. p. 89). It was formerly the
center of communication between Buenos Ayres and the western
provinces, with Paraguay, whose enormous supply of maté
to those provinces, Chill, and Peru, mostly passes through
Santa Fe. But the presence of Paraguay to external com-
merce, the disturbed state of Santa Fe, owing to domestic
dissensions, and the frequent encroachments of the Indians
from the Gran Chaco, almost entirely destroyed its trade,
and reduced the inhabitants to poverty. Santa Fe is how-
ever so admirably situated for commerce that it cannot be
questioned that, if the tranquillity of the country could be
secured, the partial revival of trade, which has taken place
since the opening of the navigation of the Rio Parané, will
be more than maintained; indeed it might be almost inde-
finately extended with a larger, more wealthy, industrious,
peaceable, and energetic people. The major part of
the inhabitants are of Guarani origin, who settled here after
the expulsion of the Jesuits in 1760. There are also many
Indians, who reside in villages (of which there are
thousands), of which the city of Santa Fe, (the chief), and spio the china and
make the piscoos usually worn in the country; they are
however generally wretchedly poor and degraded. Santa
Fe, like the other provinces of the Argentine Confederation,
owns a nominal dependence on the central government; the
executive power is vested in a governor elected by the
provincial assembly.

Rosario, situated on the high and precipitous bank of the
Paran, a considerable distance below Santa Fe, appears
likely to become the commercial emporium of the province,
being situated in a fertile district, conveniently placed for
the steamers navigating the Paran; and much the most
convenient port for the foreign commerce of the western and
north-western provinces. It wears a far more com-
mercial appearance than the capital; has a larger population;
and the inhabitants are said to be industrious and diligent.
Mr. Mc'Cabe, whose visits were made for commercial pur-
poses, says, in his "Two Thousand Miles Ride through the
Argentine Provinces," that "next to Monte Video, Rosario is
the most rising port in this part of South America."

SANTA FE [NEW MEXICO, S. E.

SANTIAGO DE ESTEBO. [PLATA, LA.

SAPHRINE. [MINERALOGY, S. E.

SAPONINE. [CHEMISTRY, S. E.

SAPONITE, a Mineral consisting of silice, magnetite,
alembic, iron, and potash. It is found at Lizard's Point,
Cornwall, a place which is the most celebrated island in
that part of the lake. It becomes brittle on drying, and is of
a white, yellow, blue, or red colour.

SÁRÁWÁK, a province on the north-west coast of the
island of Borneo, of which Sir James Brooke is the Raja,
or governor, under the appointment of the Sultan of Borneo.
The province of Sarawak extends between 1° and 10° N. lat.,
109° 40' and 111° 40' E. long. It is watered by the river
Sarawak and its tributaries. [Borneo.]. The capital, Sarawak,
formerly Kechin, contains a population of about 15,000.

SARCOCOLIUM. [CHEMISTRY, S. E.

SARDINIAN STATES. The dominions of the House of
Savoy constitute a monarchy, the head of which derives its
title of king from the island of Sardinia. A general statement
of the resources and political organization of these
islands may be found in the section on 19,777 square miles. The population in 1848 amounted to
4,385,972. The total area of the kingdom, including
the island of Sardinia, is 29,076 square miles (about one-seventh of the area of France), and the total population in 1848 (the
latest census) amounted to 6,916,084 (less than one-seventh of
the population of France in the census of 1861). The
continental territories are divided into 11 administrative divisions
and 50 provinces; the area and population of which
are given in the following table——

</table>

An account of these divisions and their chief towns is
given under the headings of three principal

Each province is administered by a governor called Intende-
te, appointed by the king. The province is an aggregate
of communes; each commune has a sousne, or mayor, who
is subordinate to the intendente. For judicial purposes each
province has a Court of Peace, called Tribunale, which
sits in the chief town. The provinces are divided into
districts called Mandament, in each of which there is a judge
of the peace, who has a secretary. There are in all 418
of these magistrates. There are also courts of appeal. The supreme
court of Turin has jurisdiction over all the provinces on the
Italian side of the Alps and north of the Ligurian Apennines. The jurisdiction
of the High Court of Genoa extends to all the provinces of the duchy of Genoa, with the exception of San Remo. The High Court of Nizza has jurisdiction over the provinces of Nizza, Ongenia, and San Remo. The High Court of Savoy, which sits at Chambéry, decides all suits within the limits of the territory of the duchy of Savoy, including civil and the other for criminal matters. The judges are irremovable. There is an Admiralty Court which sits at Genoa; and tribunals of commerce are established in all the large towns. There is a veterans' Châtelleny of Montecarlo; of Genoa; of Chiavari, Savona, Novi, and San Remo, Turin, Chambéry, and Nice are called Consolati. The towns and other communes have a communal council composed of notables of the place, at the head of which is the syndic. The council supervises the execution of the decrees of the commune, but its acts are subject to the sanction of the intendants of the province.

The government until lately was an absolute monarchy. The late king, Carlo Alberto, published a constitution in 1848 shortly before his death, dated February 8, 1848, which has been since faithfully acted upon. It declares the Catholic religion to be the dominant religion, but gives perfect freedom of conscience to dissenters. The executive is vested in the king, who acts by the advice and with the consent of his ministers. In time of war, the provincial battalions are called into active service, and the army becomes thereby increased to about 150,000 men. The regular army in 1864 numbered 47,284 men and 7,028 horses. The corps of carabiniers, in number about 4,000 (of whom 660 are in the island of Sardinia, which is free from the conscription), are charged with the police of the country, being scattered in detachments over the various provinces. In 1855 the army was increased in consequence of the king sending 16,000 men to aid the French and English against Russia in the Crimea. In 1857 it numbered 46,373.

The naval force consists of 4 sailing and 4 steam frigates, 4 corvettes, 3 brigantines, 1 brig, 6 war steamers, and several smaller vessels, carrying in all 900 guns, and manned by 2860 men under the command of a vice-admiral. The Italian fleet is at Genoa, Villafranca, and in the island of Sardinia. The mercantile navy numbered in 1867 9034 ships, carrying an aggregate of 97,924 tons, and 31,967 men, including captains, mates, and engineers.

The public revenues of the state, as estimated in the budget of 1867, amounted to 136,961,311 francs; and the expenses to 147,326,666 francs. The national debt on the 1st of January 1861 amounted to 680,606,040 francs (27,834,300l.), including the loan guaranteed by the British government in 1855. The revenue is derived chiefly from land-tax, customs and excise duties, post-office, public works, &c.

The ecclesiastical administration of the continental states is under the four archbishops of Turin, Chambéry, Genoa, and Ventimiglia. The three dioceses of Montecnino, Tarentaise, Annecy, Aosta, Susa, Pinerolo, Acqui, Alba, Asti, Coneo, Fossano, Ivrea, Mondovi, Saitzu, Alessandria, Biella, Casale, Novara, Vigevano, Albenga, Nizza, Bobbio, Savona, Tortona, and Ventimiglia. The number of parishes is 3734; that of collegiate churches, besides cathedrals, is 74; and that of clerical seminaries, 54. There is an ecclesiastical academy for the higher theological studies at Sperga, near Turin. There are in all the continental states about 340 convents of men and 14 convents of women. The Sardinian Chambers in May 1855, all religious orders are suppressed, with the exception of those employed in "teaching, preaching, or tending the sick." The Valdenses are the most numerous Protestant sect as yet in the Sardinian states. They have their most important study at Geneva or Lussanne in Switzerland. They have churches in Genoa and Turin.

Public instruction is afforded by the royal and communal colleges. In every province there are one or more royal colleges, in which grammar, rhetoric, and philosophy are taught; and in some of them there are chairs of law, medicine, and divinity. In most towns there is a communal college, beides grammar schools. Female education is afforded almost exclusively by establishments of men of whom there are forty-two fully engaged. Scientific instruction is given in the two universities of Turin and Genoa, in which cities there are academies of sciences and of the fine arts. [Genoa; Turin.] There is a Nautical School in Genoa, and the famous School of Mines, which has various classes of mineralogy as the mines of Montiers in Tarasctane, and a naval school at Genoa. Most communes have schools for boys.

The continental states of the king of Sardinia have several great carriage-roads across the Alps and Apeninnes, which intersect their territory. The most remarkable are:—1, the great road of Mont Cenis, leading from Chambéry to Turin, constructed by Napoleon; 2, that of the Simplon, leading to Switzerland, likewise constructed under Napoleon; 3, the road from Genoa to Savona and Luco across the Eastern Rivières; 4, the road from Genoa to Novi by Serravalle; 5, the road Della Cornice, from Genoa to Nizza, along the Western Rivieres, begun under Napoleon, and finished under the present government; 6, the Chambéry to Chorges packet-office system throughout the Sardinian dominions, as well as diligences for travellers on all the high roads; and public conveyances, called 'velociperti,' on the provincial or cross roads. Under the late king, Carlo Alberto, railroads were begun to be constructed, and lines were projected from Turin to Genoa through Alessandria; from Turin to Cuneo, to Pinerolo, and to Susa; and from Alessandria a line runs up to Novara. Along these roads electro-telegraphic wires are laid down and the city of Turin has electric communication through Chambéry with Paris, and by the Gulf of Spezia with the island of Sardinia, from the south-western point of which it has been proposed to carry electro-telegraphic cables to Bonn in France. A railway is projected from Annecy to the Chambéry line; also from Montemelian to Grenoble, on the old line of the Isère, up the left bank of that river to the confines of the Arc, and up the valley of the Arc to Modane. This line in all probability will be extended from Annecy to Geneva, from Montemelian to Grenoble, so as to form a junction with the French railway system; and the project of cutting a tunnel through the Alps under Mont Cenis, so as to unite the Savoy railroad at Modane with an extension of the Turin-Susa line to Grande-Croix, has been long entertained with great favour by the people and government of the Sardinian States.

The plains of Piedmont are well supplied with canals, chiefly for the purpose of irrigation, the principal of which are in the provinces of Alessandria, Vercelli, Biella, Casale, Ivrea, Albenga, and Turin. The river system of Piedmont is described under Po.

The staple products of the continental Sardinian territories for exportation are—silk, rice, hemp, wine, and oil. Most of the rice, hemp, and wine is consumed at home. The principal manufactures consist of paper, silks, woollens, linens, glass, and cotton-yarn. The importation of colonial articles and foreign manufactures takes place chiefly through the port of Genoa. A considerable trade is carried on with Switzerland and Germany by the Lago Maggiore, and the Bernard road leading to the Grisons.

The Sardinian States have Switzerland on the north, France on the west, the Mediterranean on the south, Austiran Italy, Parma, and Tuscany on the east. They comprise the three great mountain systems of Northern Italy and the Ticino. The Sardinian portion of the Lunigiana lies east of the Magra. The surface is covered on the west and north by the Alps, on the south by the Appennines, and between these two great mountain systems is a narrow and valuable and valuable portion of the country, comprising the slopes, valleys, and plains that form the basin of the Po to the junction of the Ticino. The face of the country is described in the articles ALPS, APENNINES, GENOA, PIEMONTE, SAVOY, and under the names of the several administrative divisions or provinces.

SARGASSUM. [Fogacci, S. J.]

SASIN. [Antelope]

SATURA, a genus of Insects belonging to the order Lepadopera, with three families Bembyceida. The antennae are fringed in the male; the head is small; the wings are very broad and entire; the palpi and trunk are want.ing. S. Pavostra minor, the Emperor Moth, is one of the hand-
some of the British species of Moths. It is about 3 inches wide. The colour is greyish-brown, faintly tinged with purple; the hinder margin of all the wings has a band of pale brown and purple, the hinder band being much waved. The centre of each wing has a large spot or ocellus, which is placed on a light ground; it consists of a black pupil, with a yellow or grey iris, and partly surrounded by a light blue crescent. The larva lives on a green leaf, having a black band on each segment adorned with pink tubercles, bearing a whorl of six hairs diverging like a star. It constructs a curious cocoon, the extremity not being closed, but terminated by a converging circle of very stiff hairs, which enables the insect to make its escape from within, but completely prevents all ingress.

To the genus Saturnia some of the largest of the Lepidoptera belong. S. Atlas, the Giant Atlas Moth, has wings measuring 7 or 8 inches across. This species also, with S. Cecropia and S. Luna, have their wings produced into a tail. The cocoon of S. Cynthia and S. Mylitta are used in India for the production of silk. Laterelle states that these are the wild species of silk-worms of China. S. Cynthia is the Arrindi Silk-worm of India. (Boxburgh, Linn. Trans., vol. vii.) S. Promethea, a North American species, forms its cocoon within the leaf of a saussurias-tree, having previously fastened the stalk of the leaf to the stem by a strong silken web, whereby it is prevented from falling with the other leaves. (Westwood.)

SAURIANS. The following is a synopsis of the families of the Sauria, adopted by Dr. J. E. Gray in his 'Catalogue of the Specimens of Lizards in the British Museum.' The genera and species of Lepidosauria are given, the other large families are described under their proper names——

Order I. Lizards. Sauria.

Mouth not dilatable, jaws toothed, the lower jaw-bones being united by a bony suture in front. Eye generally with distinct eyelids; drum of the ear generally distinct. Limbs four, distinct, rarely in such a rudimentary state as to be hidden under the skin. Toes clawed. Body elongate, rounded, covered with imbricated or granular scales; rib distinct, mobile, and with a distinct sternum. Tail elongate, tapering, rarely prehensile, generally covered with whorls of scales. Egg with hard skin. The young not undergoing any metamorphosis.

Sub-Order I. Lepidoglossa.

Tongue flat, elongate, and bifid.

Tribe I. Cylcodaura.

Scales of the belly square, in cross bands, of the back and tail rhombic and imbricate, or circular and subgranular, Tongue elongate, flattened, free, nicked, or with two elongate, transverse, prominent tips. Eyes dilated, with two valvarial lids. Feet for walking; toes unequal, compressed.

a. Head with small many-sided shields. Tongue sheathed at the base.
   1. Monitorida. —Head-shields flattish, scales small. Inhabit the Old World and Australia. [Moorrooa.]
   2. Helodermitida. —Head-shields and scales of body convex, tubercular. Teeth with a groove behind. Inhabit the New World.

b. Head with large regular shields. Tongue mostly free at the base.
   * Sides flattish, covered with small often granular scales.
   3. Tretida. —Supra-orbital plate horny. Teeth solid, rooted. Scales small, granular, often with large plates. Inhabit the New World. [Trach., S. E.]

4. Lactorinitida. —Head pyramidal, covered with regular many-sided shields; supra-orbital plate rigid. Throat scaly, often with a crescent of larger scales, and a central large, scaly, behind. Tongue elongate, flat, free at the base, exsertile, long-forked. Teeth hollow, rooted. Scales granular or rhombic, keeled. Sides flat, covered with small granular scales to the species inhabit the Old or Eastern world and Australasia.

Synopsis of the Genera.

i. Nostri elliptic, in the lower hinder angle of the nasal shield, just above the labial shield, with one or two shields behind it. Eyelid distinct.

A. Toes simple, compressed, not keeled nor fringed. Collar distinct.

Zooteca. —Lower eyelid scalloped, opaque.

Z. scutilla. —The Scaly Lizard, Common Lizard, and Nimble Lizard. It is the Loricata vivipara of Jacquin; Loricata agilis, Pennant; Zootoca muralis, Gray. It has the ventral shields 6-rowed, the temple covered with many-sided shields, with a large central shield; its colour olive; back with a large brown streak on each side, and a central black streak; belly orange (in summer), black-spotted.

This little lizard is a common inhabitant of heaths and banks in most of the districts of England, extending even to the Shetland Islands. It is also one of the few lizards found in Ireland. Its range is very limited on the Continent, and is not found in Italy or France. Its movements are graceful and rapid, it comes out of its hiding place during the warm parts of the day, from the early spring till autumn. It lives upon insects, which it seize with its mouth. In this species the eggs are retained in the oviduct until the young are ready to be hatched, and they are thus produced alive. The young when brought forth are fully-formed, and capable of running about and taking their own food. The usual length of this lizard when full grown is from 53 to 64 inches.

Z. maurus. —The Tiligueta, is a native of the south of Europe.

Z. oceophalus, the Long-Headed Lizard, is a species brought by Mr. Webb from either Spain or Madeira.

Z. Tourico, a native of the Crimea, Morea, Corfu, and Sicily.

Z. termitata, the Striped Lizard, a native of South Africa.

Z. Dermisana, a native of Australia.

Z. Galloti, Madeira.

b. Scales granular or 5-sided, elongate. Posterior nasal shields 5, small, one above the other. Collar distinct.

L. stirmianus of Milne-Edwards and others. The upper hinder nasal small, rather in front of the larger lower one; scales of the temple small, unequal, irregularly many-sided, often with a larger central one; throat solid, distinct, brown, spotted with black; sides green, brown-eyed, beneath white. This species is a native of Great Britain, and is especially abundant in the neighbourhood of Poole in Dorsetshire. Its general abode is on sandy heaths, where, from the rapidity of its movements, it is often mistaken for some form of snake. On account of the rapid locomotion it is not often caught. It does not bear confinement, but pines away and dies. When caught it often bites, but no ill-consequences are the result. The female lays eggs. The eggs are whitish. The eggs are contained in small pods, the number of 3 or 4 in hollows in the sand, which she excavates for the purpose. They are subsequently hatched by the heat of the sun. The eggs appear to be laid a considerable time before they are hatched. In this respect this species differs very much from the common lizard, which always brings forth her young alive. This lizard is larger than the Zootoca vivipara, as those of average size measure about 7 inches in length.

L. vividus, the Green Lizard, has the scales of the temple inequilateral, many-sided, with a central larger one; back granular, oblong, with sharp corner sides; throat-fld distinct. This species is a native of Guernsey and Jersey, and also of the south of Europe. It is much more readily caught than the last species, and never attempts to bite. It may be readily taken and taught to come to hand for food. It will lie coiled in the two hands, and never attempt to escape.

L. cocellata and L. lusitana, both natives of the south of Europe, are the only other species of the typical genus Lacerta.

Thelonica. —Lower eyelid transparent. The only species is T. perspicillata, a native of Algiers.

Terra. —Lower eyelid opaque. Chin-fld distinct. Abdominal shields flat and shield square. T. punctata, a native of Madeira, is the only species.

N. Landii, a native of the Cape of Good Hope.

N. tessellaris, a native of South Africa.
8. Chirocotes.—Scales of the back imbricate, 6-sided, lanceolate, keeled, narrow, in cross series; of the tail in rings, alternating with each other. Ears hidden. Femoral pores distinct.

10. Chamaeleon.—Scales imbricate, all elongate, rhombic, keeled in longitudinal series, the keels forming longitudinal ridges. Limbs simple, undivided. Temple scaly.

II. Geosaurus.

Tr. scales of the belly and (almost always) of the back and sides incisural, rounded, imbricate. Sides rounded. Tongue narrow, short, flat, and slightly nicked. Head with regular shields.

a. Eyes distinct, exposed, eyelid rudimentary. Head conical.

b. Eyes distinct, eyelids distinct, connivent. Head conical.

15. Seina.—Rostral shield moderate, triangular. Notostril in a plate between the frontal and labial shields. [Sclerodermus.]

17. Seina.—Rostral rather large, square. Notostril in a notch in the hinder edge of the rostral.

18. Acomia.—Rostral large, cup-like. Notostril in the rostral, with a narrow slit to its hinder edge.

c. Eyes hidden under the skin.

19. Typhlon.—Head conical. Rostral shield cup-like. Notostril in the rostral shield, with a slit to its hinder edge.

20. Typhlon.—Head short, depressed. Rostral shield elongated, extended up the forehead. Notostril in an elongated nasal shield. [Typhlon.]

Sub-Order II. PachyGLOSS.

Tongue thick, convex, attached to the gullet at the base.

II. Nectiasaur.

Tr. scales of the belly small, rhombic, imbricate; of the back and sides granular. Tongue thick, short, convex, end slightly nicked. Eyes nocturnal; eyelids circular, not connivent, pupil linear erect. Feet for walking; toes subequal, scaly beneath, and generally dilated.

21. Geckota.—The Old and New World. [Gecko.]

IV. Siroboliana.

Scales of the belly small, rhombic, imbricate; of the back and sides imbricate. Tongue thick, short, convex, end slightly nicked. Eyes diurnal, with valvar eyelids; pupil round. Feet for walking; toes unequal, compressed.

22. Iguana.—Teeth on the inner side of the jaw-bone. New World. [Iguana.]

23. Agama.—Teeth on the edge of the jaw-bone. Old World and Australasia. [Dactyloida, S. 2.]

V. Verdier.

Scales of the belly small, rhombic, imbricate; of the back, sides, and back granular. Tongue elongate, subcylindrical, worm-like, very extensile. Eyes globular, very mobile, with a small, central, round opening. Toes equal, united into two opposing groups.

24. Chameleoni.—Teeth on the edge of the jaw-bone. Old World. [Chameleoni.]

The image contains a page from a book or a document. The text is written in German and seems to be a historical or biographical account regarding individuals named Schadow, Johann Gottfried, and Helweg. The text mentions dates such as 1788, 1801, and 1814, indicating historical events or publications. The text also references various locations and institutions, such as Berlin, Munich, and the Royal Academy of Sciences. The content appears to discuss the development of a particular artistic movement or philosophy, possibly involving figures like Schelling and Hegel.

The page contains several paragraphs, each starting with a capital letter and includes technical terms and academic referencing, indicating a detailed and scholarly approach to the subject. The text is dense with information, typical of a scholarly work from the 18th and 19th centuries.
and Schellingian increased—the former system evidently victorious till 1831, when he died at Berlin, and Schelling remains a Germany already filled with the adherents of his opponent, and regarding Arick as superannuated and left behind in the philosophic march. Schelling was aware of his position; but he was of opinion that youth could not continue to exist without an active, living connection with the past; and a connection of the kind he had preceded Hegel's, but by only bringing out aspects of it not formerly made apparent, and developing some modifications, the necessity of which he had overlooked, he should be able to present Schellingian in a form which would enable it to harmonize with the necessities of the age. Nazism was a movement which would appeal to him in Germany, and which would at the same time bring it into harmony with other modern movements of German thought with which he sympathized, and especially with the religious movement. Nazism, in fact, was of the same faith as opposed to Rationalism. Accordingly, the later portion of Schelling's life—first at Munich, and afterwards at Berlin, to which he was transferred in 1841—was spent in the ruminating, and partly in the public announcement of this second or mastered edition of his philosophy. In Berlin—where he retained his chair but for a few years, but where he afterwards lived habitually—the old man was revered as a philosophic patriarch, and his society, like that of Humboldt, was sought after by savans and thinkers. But at the same time the new philosophy, that of Hegel, appeared to have held him in high esteem. To them the nature of his second or final philosophy may have been made clear by his own conversations; but he had not published one jot of it. Nazism remained powerful throughout Germany otherwise than vaguely when he died, in August 1854, at the age of seventy-nine. His death took place at Ragusa in Switzerland, whither he had gone for the benefit of his health.

In the general appreciation of Schelling's philosophy, it is necessary to remember it in its historical relations as a portion of that continuous development of philosophic thought in Germany which Kant began. Kant may be said to have been the two-fold tendency of the philosophy of the countrymen—the tendency to Objectivism, which supposes a firm external reality in the universe, underlying all phenomena, and constituting the No-Me; and the tendency to Subjective Idealism, which regards the thinking mind as the sole reality, and sees all the so-called objects and phenomena of the universe only as modifications or projections of the Me, or as so much various thought of the thinking being. "All subsequent German philosophy has been the prosecution of one or other of these speculative tendencies: the category of origin in the universe, whether the realistic side were Jacobi and Herbart; the latter of whom especially fought against the too great Subjectivism that there was, or that there might be found, in Kant's "metaphysics of nature," as he might be called the process of thought in the universe itself gradually out into the real, or at least what exists, Schelling himself set the example. He interpreted what is called inorganic nature, with its laws of gravity, light, magnetism, and electricity, as being the absolute in what he called its "first potence," or working on its first efforts for converting the possible into the actual. Even here the subjective and the objective were already differentiated, but objectivity predominated. Then came the second potence, or potence of chemism, representing a higher degree of development in the processes of the universe; this succeeds the third potence, of organically living nature, where we first see the aspect of consciousness or predominating subjectivity. Though Deity is immanent in all things, and nature is in itself sufficient to us, in the highest sense of man is identification with Deity—a relapsing into the infinite. The ideal in man also corresponds to the real in nature; and in the perception of this is the true philosophy of art. Such was the doctrine of 'absolute identity,' as it was propounded in Schelling's first or earlier philosophy. For a fuller view of the immense extension which he gave to it, as affecting every possible department of thought, we must refer to his own writings; but a very concise and professed summary of Schelling's system given by Chalmin in his 'Historical Development of Speculative Philosophy from Kant to Hegel' (of which there are two English translations); or (for more popular purposes) to Mr. Morell's 'Life of Schelling,' and his 'History of Speculative Philosophy from Hume to Immanuel Kant,' and more especially to the 'Infinite becoming Finite,' the 'Immanence of Deity in Nature,' and the 'Deduction of Metaphysics from the Properties of the Mind.' Information on the same subject is to be obtained from Cout; and there is a French work entitled 'Schelling;' Écrites Philosophiques, at Morceaux propres & donner une idée générale de son Systéme; traduits par A. Diderot, 1844. This work includes Schelling's lectures on the methods of academic study. His discourse on the philosophy of art is accessible in English. (Chapman's 'Catholic Series,' 1844.)
by Goethe, Tieck, and other poets. But, as we have said, the system did not remain satisfactory even in Germany. On the one side Hegel had tried to tear it to pieces on the score of its substitution of enthusiasm and poetry for logic, and had promulgated a system which found more acceptance with harder minds; on the other, the re-awakened Christian zeal and moral asceticism had led to the consecration of Pantheism, leaving no room for that 'personal God' which the human soul demanded as essential to true religion, and, moreover, in its identification of man with deity, contradicting those notions of man, redemption, and salvation in the way of Christ. To prop up his system against these attacks, or, at least, to re-issue his system in a form which would save it from attacks from the latter quarter, was Schelling's object during the last portion of his life. His last volume, which, as the time was ascertainedable, will be found in Chalypseus. Suffice it here to say that, by a peculiar modification of his theory of the absolute,—according to which modification he now maintained that, though nature and Deity were identical, yet nature might not be and was not co-extensive with all Deity, that is, that the absolute might be considered as being in all objects and yet not as being exhausted in all objects taken collectively, but as being moreover a certain force or fund of nature, eternal and unchanging, that he set himself right with theology at all points, and emerged out of Pantheism into pure Theism, and out of Rationalism into warm Christian faith. Working his new notion into such phrases as that 'the part of the absolute is that of the common,' he came to an entire renunciation of most peculiar part of Deity,' and that 'what is inmanent in nature is that in God which is least God himself,' he arrived at the doctrine of a 'personal God,' and also at the notions of 'human imperfection,' and 'moral evil,' and so he reconciled his philosophy with the Christian scheme of the world's history as a fall from good and a divine recovery.

SCHIRHÜS. [Physic, Practice of, under Microscopic Diagnosis, § 2.]

ANGRILLAX Rock, of a coarse laminated structure. [Slate.]

SCHNORR VON KAROLSFELD, JULIUS, was born at Leipzig on the 20th of March, 1794. His father, Hans Schrorn von Karolsfeld (born 1784, died 1840), a painter of some celebrity in his day, was director of the Art-Academy at Leipzig, and Julius received his earliest instruction in art from him, though he was desirous that his son should adopt a different profession. But the boy displayed at an unusually early age such remarkable talent for art, and so earnest a desire to follow it, that the elder Schnorr was induced to yield, and at the age of sixteen Julius was entered a student in the Academy of Painting, at Vienna. There he distinguished himself, though the formal conventionalisms inculcated by his masters were unsatisfactory to the development of his original genius. Happily in good time he proceeded to Rome (1815) where he at once attached himself to the society forming under the auspices of Cornelius and Overbeck, a group of more favourable example. Another young German painter brought their productions fairly before the artistic world, Julius Schnorr was recognised as one of the most accomplished of the promising band. His work the 'Wedding in Cana,' attracted so much notice that he was chosen along with Cornelius and Overbeck to paint the walls of the villa Massimi at Rome, in the revived art of fresco, with designs from the trio of great Italian poets, Dante, Ariosto, and Tasso. To Schnorr was assigned Ariosto, and his designs were the most successfully executed. He also produced while at Rome 'Jacob and Rachel,' ' Jacob's Ladder,' and 'Ruth in the field of Boaz,' 'Flight into Egypt,' and other important works.

At Rome Schnorr had gained the friendship of Niebeloh, Humboldt, and Bunzen, by whom he was introduced to the munificent patron of artists, Ludwig, crown-prince and afterwards king of Bavaria. When Ludwig set about the construction of his magnificent works at Munich, Julius Schnorr was engaged with him, as he summoned to assist in decorating them. He removed with his master in 1807, and being appointed professor of historical painting in the Academy of the Fine Arts there. His first great commission was to paint the state apartments of the new palace, with a series of frescoes of national history. After these had proceeded some way however, they were suspended in order to complete the decoration of that portion of the palace called the Fest-Saalbau, three grand saloons of which were given to Schnorr to adorn with paintings of large dimensions representing leading events in the history of Charlemagne, Frederic Barbaresco, and Rudolf of Hapsburg, the three rooms being severally named after those personages. These three series of paintings occupied Schnorr above ten years. He made all the designs, prepared the models, and superintended the execution of the most important paintings, but the greater number were painted under his supervision by his pupils. They are painted in encaustica, and have a grand appearance. In some may be discovered more or less of the defects of the French method, others simplicity carried to excess, in many a great redundancy of drapery, and exceptions may, perhaps justly, be taken to much of the colouring; but after every drawback is allowed, it must be confessed that they display abundant and vigorous ingenuity, correctness and skill, and that they produce a very impressive effect.

On the completion of his historical, Schnorr returned to his mythic series. Having destroyed such of the frescoes already done as did not satisfy his more mature judgment, he set himself with characteristic diligence to the great task.

As completed the Nibelungen series occupies five chambers, each named from the section of the Lied which is depicted in it. The first called the 'Entrance Hall,' contains the event of Siegfried's death, the second or 'March by Halls' is devoted to the leading events in the life of Siegfried. The third, the 'Hall of Treachery,' contains the story of Hagen's treachery, from the moment when Kriemhild informs Hagen of the secret of Siegfried's vulnerability, to its consummation in the murder of the hero. The fourth, the 'Hall of the Beasts,' carries the story on to the death of Hagen by the hand of Kriemhild, and her own death by the sword of Hildebrand. The fifth is the 'Hall of Lamentation.' These paintings, which are in fresco, were executed in a style and with a conscientiousness and skill and his pupils. They have all the artistic excellences of the historic series just noticed, and are painted with a broader and more genial feeling. Of all the many great modern paintings in Munich, these are perhaps the most remarkable at the exterior, both among the artist's countrymen, and with strangers.

Schnorr continued to reside in Munich till he had completed his great works in fresco and encaustica, busy also during the whole time on other paintings, and designs for engravings, of various degrees of importance, but sufficient alone to have secured him a foremost place among modern painters. In 1846 he accepted an invitation to become director of the Picture Gallery, and professor in the Academy of the Fine Arts at Dresden, where he remained making a course of persevering diligence till his death, which occurred on the 13th of April 1855.

Several of the works of Julius Schnorr have been engraved. In England he is perhaps best known by his extensive and magnificent designs for the 'History of the Life of Jesus,' published in 1840, 1842, &c. These have been reprinted in London from the original wood-blocks, and though more suited to the taste of Germans than ordinary English Bible-readers have met with a large sale. They are the works of Schnorr, for they, like most of Schnorr's works, are most successful in passages admitting of somewhat exaggerated expression and action. Schnorr also made the designs for an illustrated edition of the Nibelungen published in 1843, but he is best known for his disadvantage in designs of so small a size. An elder brother Ludwig Schnorr, born in 1789, also acquired considerable notice in early life by a large altar-piece of St. Cecilia, a Feast, and some other pictures, but he scarcely maintained the position his early success had placed him at Vienna or acquired in the many portraits, as well as various historical and genre pictures.

SCHOLEFIELD, REV. JAMES, M.A., was born November 15, 1798, at Henley-on-Thames, Oxfordshire. His father, Nathaniel Scholefield, was minister of the Independent Dissenters' chapel, in that town. He was educated in the school of Christ's Hospital, London, became a Grecian there, and obtained several prizes. He was entered of Trinity College, Cambridge, in 1812, and in that year obtained the Crag University Scholarship. He took holy orders in 1813, by special permission, before he had taken his degree of B.A. Soon afterwards, on the recommendation of his tutor, he was appointed to a fellowship and the Readership in Hebrew and Oriental languages. After having held the Readership for six years, he was appointed to the Chair of Oriental and Hebrew Language and Literature at the University of Cambridge, and was in the list of Senior Optimes. About the same time he became curate to Mr. Simeon, of Trinity Church, Cambridge. In October 1815,
especially those of the poorer classes. From that period the interest has greatly increased; many plans have been proposed, some have been adopted, and even in the establishments for the education of the more wealthy classes, much improvement has taken place.

From the earliest times, when the Scriptures were freely opened to all, no one believed that it was a necessary qualification for a Christian man or woman that he or she should be able to read the Scriptures. The oral instruction of the mass of the Universe was all-sufficient in religion. To have an educated class, as distinguished from an uneducated, was the object of those who most valued sound learning. The first colonists of New England founded a common school wherever they met to clear the forests and to raise their towns. All who sought a country where they felt the light of religious intelligence burning amongst them. Not so in the mother country. Neither the motive of love nor the motive of fear seemed to lead us to think of the education of the masses till the times in which we now live. The education that was amongst our forefathers was sufficient, in their estimate of what was good. There was a system of education amongst them which they cherished and upheld. We live in another era; but is it not for wise men to be wise to that which comes?

There are four clear divisions in the progress of education in England, limiting the inquiry to that education which is wholly, or in part, gratuitous:—

1. Education by the Church, from the establishment of monastic institutions to the Reformation.
2. Education by endowment, immediately subsequent to the Reformation, for the most part limited to schools for the higher branches of learning, called grammar-schools.
3. Education on a more commonly termed free schools, mostly established by endowment, but also, in many cases, by subscription, for the instruction of a select portion of the poor in reading, writing, and arithmetic.
4. Education by voluntary associations, whether as Sunday schools or day schools, which, within a few years past, received a limited measure of support from the State.

The exclusive education by the Church has passed away. Education by the State never existed in England—even in the most restricted sense of state-counsel and small money. The last division—till within the last eighteen years. The education of the people since the Reformation has proceeded from the people. It has been uniformly in a state of progress, though occasionally exposed to corruption and consequent decay. The endowed grammar-schools are coincident with the progress of the middle class; the free schools which are not grammar-schools go along with the gradual rise and progress of the operative class; the Sunday schools, and the other associations of the second and third century—belong to a new era, when the universal education of the people is held to be a matter of duty and necessity. The advance of public opinion as to this duty and necessity forces on the last condition of progress—education by the State.

The endowed grammar-schools were the natural successors of the schools and chantries of the unreformed Church. They contemplated no education except the most liberal. Children were to be brought up as scholars, or to be taught nothing. The grammar-schools were the nurseries of the learned professions, and they opened the way for the highest honours of these professions to the humblest in the land. About the time of the Revolution the commercial classes, who had grown up and could not naturally think that schools in which nothing was taught but Latin and Greek, were not altogether fitted for those who were destined to the life of traffic. Uneducated men who had pushed their way to fortune, generally resolved to do something for their own class; and thus were to see in every town, not a free grammar-school, but a free school, over whose gates was generally set up the effigy of a boy in blue or green, with an inscription bequeathing that the school was founded by the A. B. or C. School. It was this school that was for twenty poor boys, to be clothed, and taught reading, writing, and arithmetic. With a comparatively small population these free schools, we venture to think in opposition to the present unprincipled beginnings of the education of the poorer classes. While the grammar-schools were making divines and lawyers and physicians out of the sons of the professional classes and the wealthier tradesmen, the free schools were making clever handicraftsmen and driving
burgesses out of the sons of the mechanics and the labourers; and many a man who had been a charity-boy in his native town, when he had risen to competence, pointed with an honest pride to the institution which had made him what he was, and he drew his purse-strings to perpetuate for others the benefits which he had himself enjoyed.

According to the digests of the Reports made by the Commissioners for Inquiry into Charities presented in 1848, the annual income of the free schools and schools with small fees amounted to £82,047l., but some schools were excluded from the inquiry. The annual income of the free schools, described by the Commissioners as "schools not classical," was £28,744. The digest of the Commissioners’ Reports does not give us the number of endowed schools, nor of children therein educated. But we may form a tolerable approximation to the number, from the returns furnished by the ministers of the respective parishes in England and Wales, to a committee of the House of Commons, in 1818. According to these returns the annual revenue of the endowed schools of England was £300,625l., to which if we add 7000l. for Wales, we have a very near approach to the revenue of the digest of 1848; the same returns state the number of endowed schools in England as 4106, and of children educated therein, 165,433; and in Wales, schools 209, children 7625. In 1833 a series of questions was directed to the overseers of the poor in England and Wales, the answers to which would show a fallible estimate of the number of and the circumstances of the children therein educated, giving the schools as 4106, and the children as 163,764. If there were such a falling off, it may be accounted for by the fact that some of the endowed schools have been converted into national schools. Comparing all the returns, we may say in round numbers that the income of the endowed schools was 300,000l.; the number of schools 4000; and the number of scholars 150,000.

The 200,000l. thus derived from the rent of land, rent charges, funded securities, &c., during three centuries, has been the foundation upon which has been built up much of the sterling worth of the English character. One hundred and fifty thousand children have been receiving, for a long series of generations, in the hands of the most liberal and the most learned of the commonest order of worldly knowledge, all of them of religious instruction,—at an average cost of 2l. per child. The average cost of each scholar in the national schools is 11s. 2d. per annum. There have been many attempts, and some have been successful, to turn the funds of the endowed schools, contrary to the wishes of their founders, into schools for universal education; and had these attempts been supported by the Court of Chancery, or encouraged by the legislature, they might have been used in the education of the entitled funds, upon the model of the board schools, instead of 150,000l. We apprehend that, with the best intentions, some unsound opinions have been taken up by the subscribers of endowed schools. The registrar-general, in his very able Statement of the Regulations of the English education of children, says: "The insufficiency of the national education is the more to be regretted, as the means of education exist, and the funds left for educational purposes, if properly applied, in the charities and public institutions, would, with some assistance from Parliament, supply the children of the poor with the sound knowledge which the scanty earnings of the parents do not enable them to purchase." We affirm that these funds are properly applied when they are applied to the precise objects contemplated by the donor, and not when, under the pretence of reforming abuses in the management of some of these institutions, which have been corrected. The Commissioners of Inquiry into Charities reported a vast amount of delinquency and neglect, especially with regard to grammar-schools. The Court of Chancery, upon the recommendation of the Commissioners, through the attorney-general, has remedied many of the most glaring evils; and we have now many institutions distributing a large measure of good, where formerly were only "no books, and no masters." "Impoverished schools," as the master of schools, in his report to the Under-education Commission, said: "I attended the inspection of schools, and visitors at the present day would be ashamed of such gross misapplications of the means of preserving sound learning amongst the people. Legislative action has been brought to bear upon some; and the Harper Charity at Bedford, and Dulwich College, for which an Act was passed in 1807, now make their ample means much more generally advantageous. Abuses, no doubt, still exist; but, as a whole, the grammar-schools have worked well in this country. They have been alive amongst us as the liberal studies which have nourished a race of divines, lawyers, physicians, statesmen, that may challenge comparison with those of any nation. They have opened the gates of the higher employments to industry and merit, and the people of the middling classes, the free schools, are left to occupy the places in a different manner. They were the prizes for the poor boy who had no ambition, perhaps no talent, for the struggles of the scholar; they taught him what, amongst the wholly untutored, would give him a distinction and a preference in his worldly ways; and he was envied by the richer fortunate, because they knew that there was no absolute bar to their children and their kindred running the same course.

Do we assert that there is nothing to be desired beyond this state of things? Unquestionably not. But we do desire that no feelings falsely called utilitarian, should induce us to wish the appropriation of funds to one purpose, that were appropriated to another purpose. An American writer, speaking of the property given to endowed schools, says: "It is easy to see that, if this sum were consumed, and then the proceeds of it were to be productive of incomputable good." (Horace Mann's 'Educational Tour,' 1844.) The evil is computable, as well as the good. The good would be the education after some universal manner of some 900,000 children, instead of 150,000; the evil would be, that they would not be educated after the manner prescribed by the founders of these schools, and we think that the manner prescribed by the founders is more than ever necessary as education of some sort becomes universal. We desire most ardently to feel that he was not doing more good as an individual by leaving a thousand pounds to support a highly meritorious poor scholar by an exhibition at the university, than by leaving a thousand pounds to instruct fifty boys and girls in reading and writing. And why? The difference of the character of the two...
To Ireland the grants of money for the diffusion of education have also been large, and, on the whole, increasing. An Act for establishing Public Libraries and Museums in Ireland (18 & 19 Vict. c. 40) was passed in 1853; and a number of schools have been established, chiefly under the direction of the Roman Catholic clergy, which are unable to supply the place of Reformatory schools. The repeal of the county library tax on newspapers in 1856, and the reduction of postage on printed papers, books, and MSS, may also be fairly considered as aids to education.

In addition to this legislative action, the general public have not been wanting in efforts to diffuse education. In most of the large towns Ragged Schools have been formed and supported for the instruction of the more destitute children; and, in conjunction with more school learning, it has been endeavoured by some of the Catholic benevolent societies to establish Shoe-Black Brigades and Crossing Sweepers, which boys during the day are enabled to earn money, a part being devoted to their support, and the remainder placed to their account, to form funds for their advancement; their evenings being spent in school. The results on the whole, have been very satisfactory. Schools have also been established for teaching girls Common Things, chiefly in domestic economy. The preparation of teachers has been encouraged by various means, for the education of male and female, are now appointed to any of the schools, without certificates of capability from recognised examiners. For this purpose the British and Foreign School Society and the National Society have established normal and model schools, where inspectors can be appointed at different rates of salary, and certificates granted. Inspectors are appointed to visit all the schools by the Board of Education, and also by the above-named societies to visit their own; and in the Report of the General Board of Education for 1856, Mr. William Davis, B.A., says: "Remembering, as we do, the kind of education given in most of our British schools some ten years ago, it is with no ordinary gratification that I observe the vast improvement that has been effected, both in the quality of the instruction, and in the methods of imparting it." The Report, in 1854, of Mr. Horace Mann on Education, compiled upon the materials furnished by the census of 1851, confirms this. He states that there were then 40 colleges, supported at an annual cost of 60,000l., and that about 270 qualified teachers issue annually. By the whole about 400 masters and 320 mistresses are annually prepared for their duties.

Looking, then, to the prodigies executions that have been made since 1833, we may conclude that from official returns we should find such an increase of school accommodation, and of children under instruction, as would leave little to be done beyond a steady perseverance in the same course of voluntary exertion and support, with reference only to the numerical amount of education; the quality of the education given embraces a much wider range of inquiry. Important as it is to ascertain with exactness the number of children daily receiving instruction by the aid of voluntary benevolence, or by endowment, the means of such computation are not yet perfect; and the computations of those who take different views as to the necessity of State interference are so widely different, that it requires a very careful analysis and, what is more, a complete abnegation of the spirit of partisanship, to enable us to arrive at safe conclusions.

The Rev. Mr. Hook, in a pamphlet published in 1846, calculated that for the proper instruction of the people, one in every fifty of the population would be necessary. Government inspectors say, with reference only to the numerical amount of education; the quality of the education given embraces a much wider range of inquiry. Important as it is to ascertain with exactness the number of children daily receiving instruction by the aid of voluntary benevolence, or by endowment, the means of such computation are not yet perfect; and the computations of those who take different views as to the necessity of State interference are so widely different, that it requires a very careful analysis and, what is more, a complete abnegation of the spirit of partisanship, to enable us to arrive at safe conclusions.

3,690,000, leaving nearly 800,000 unprovided for. But among the industrious and working classes comparatively few can afford to keep their children at school till they are fifteen, and the far greater portion will only be at school for periods of four or five years, or even less. It is not easy to test the average number of children sent, but an estimate, made in 1793, was 3,096,138; or 160,008; but this, however, that the census includes all persons at school, and that of the 266,611 of whose teaching accounts were obtained, 17,766 were from fifteen to twenty and upwards. This would reduce the comparative number with England and Ireland. As 100 boys and 41 girls, one in every 200 in the population are not so much frequented as in England. At the time of the census there were but 292,545 scholars, or little more than one in ten of the population. At adult evening schools the number of scholars and masters was 32,000.

Of the total number of boys in the public day schools, out of 153,718 of whom information was given, 134,337 were being taught reading, 83,005 writing, 68,174 arithmetic, 42,362 English grammar, 44,582 geography, 6770 modern languages, 9111 ancient languages, 6400 mathematics, 4197 drawing, 31,887 music, and 1098 industrial occupations. Of 119,085 girls in public day schools, 98,612 were being taught reading, 61,590 writing, 24,435 arithmetic, 54,433 English grammar, 29,579 geography, 2290 modern languages, 566 ancient languages, 1017 mathematics, 1070 drawing, 21,616 music, and 17,086 industrial occupations. The proportions are nearly the same in the private day schools. We may remark, however, that in the parochial schools music only means that they are taught to sing such songs as are used in the Church of England; only the number of schools in which such subjects are professed to be taught. In Scotland the average yearly salary of the parochial schoolmaster is 50L, with, in general, a residence; of the mistresses the salary is 36L, with a residence. Here the object of the two last-named institutions is to afford the instruction of parochial schoolmasters, but the improvement was not great, as is shown by the census returns.

In Ireland the endeavour to promote education has been constant, but till lately was of little effect. It was not until 1782, that an Act was passed that every clergyman should teach the English tongue to all in his cure. By the 12 Eliz., cap.1 (1707), a free school was to be established in every diocese. The statute of Henry VIII. was re-enacted under William III. Of course, the object in the two last-named institutions the Protestantism should be taught; or course the schools were ineffective; and almost of course they became a mere form, the clergyman giving forty shillings a year to some one called schoolmaster, and not a copper tinker trouble. In 1712 the Incorporated Society for Promoting English Protestant Schools in Ireland was established, and was liberally assisted from the public funds. In 1741 they had formed 18 schools, at which they had educated 372 children (who were of course taught to spell), and their petitions 50,000. These were the Charter Schools. In 1784, after an expenditure of 490,000L, the celebrated John Howard proved that the children were ill-taught, their education was not attended to, and that the boys only were instructed. In 1801 and yet only the children of Roman Catholics were admitted for the purpose of conversion. The Irish House of Commons admitted the facts, but continued to vote money. In 1808 orphans and children of Protestants were admitted as well as Roman Catholics, but with the same separation from their families as before. The number of scholars increased, but were still under 2000, and the annual cost was 35,000L, which sum three-fourths were paid by the State. After a report of 1812 the whole support was gradually withdrawn from them. But though the reports utterly failed, the Irish poor were far from being an uneducated people. There were 'Hedge' schools, where the children of the peasantry were taught by the priest so effectually, that Wakefield in his 'Four in Ireland' called the Irish "universally educated" people. In 1817 the Kilclare likewise began their operations. They were to form two model-schools in Kilclare Place; they were to assist with grantees the founding of others; they were to establish and quality masters to publish and furnish them with proper books; to cause the schools to be inspected annually; and to encourage deserving masters and mistresses by gratuities. These schools were at first a success. They were supported by nine parishes, granting 20L to each of the schools of all religious persuasions. In 1825 there were 1490 schools, and upwards of 100,000 scholars, but their length became distasteful to the Roman Catholics, in 1831, therefore, after a Parliamentary inquiry, a Board of
National Education in Ireland was established, composed of eminent men from all the religious beliefs in Ireland, who were commissioned to draw up a scheme of instruction, and provide a system that would be fully comprehensive (i.e., with a salary of 200L), modern languages, natural history, mineralogy and geology (each with a salary of 200L), English law, jurisprudence, and political economy, civil engineering, and agriculture (each in 1864). The legal languages, the practice of surgery, the practice of archery, midwifery (each with a salary of 100L). There are also attached to each college a registrar (with a salary of 200L), and a bursar and librarian (each with a salary of 100L). A small number of students are provided with a salary of 200L. The total annual expenditure for salaries is thus (deducting 250L for the professorship held by the vice-president) 5500L.

The remaining 1500L of the annual charge on the consolidated fund is devoted to the payment of scholarships and prizes. The scholarships awarded at the commencement of the session at Belfast are: 45 of 24L each to students of the faculty of arts; 4 of 20L each to students of the faculty of medicine; 2 of 20L each to students of the faculty of law; 2 of 30L each to students of civil engineering; and 4 of 16L each to students of agriculture; the number being equally divided in all cases between students of the first and students of the second year. The scholarships have been continued for one year.

The session in all the colleges extends from the third Tuesday in October to the second Saturday in June, and is divided into three terms by recesses of a fortnight at Christmas, and Easter, and a longer recess of 2½ months.

In 1854 the Act was passed for endowing Maynooth College for the better education of the Roman Catholic priesthood. In the same year was also passed an Act "enabling her Majesty to endow new Colleges," in consequence of which the Queen's colleges of Belfast, Cork, and Galway have been built and endowed. A sum of 100,000L. was assigned out of the Consolidated Fund for the purchase of the sites, and erecting and furnishing the buildings of the three Colleges. Her Majesty and her successors were made proprietors of these provinces. It was provided that the Crown should be the executive office. The appointment of the presidents, vice-presidents, and professors, was entrusted to the Crown, until Parliament should otherwise determine. The Commissioners of the Treasury were to be paid a salary exceeding 7000L for the payment of salaries and other expenses in each college; it being moreover provided that reasonable fees should be exigible from the students. Lecture-rooms were directed to be assigned for religious instruction; and it was enacted that no student should be allowed to attend any of the colleges unless he should reside with his parent or guardian, or some near relation, or with a tutor or master of a boarding-house licensed by the president, or in a hall founded and endowed for the reception of students.

A president and vice-president for each college were soon after nominated, and the erection of the buildings was begun. The other appointments were made in August 1849, and the three colleges were opened in the end of October following. An additional sum of 12,000L. had shortly before been granted by Parliament for providing them with libraries, philosophical instruments, and some other requisites.

Originally it was intended that the number of professors in each college, exclusive of the president and vice-president, should not exceed thirty. The vice-president however is also a professor. New letters patent embodying that extended scheme were granted in favour of each of the three colleges in November 1849. Under the existing constitution, then, the body politic and corporate of each college consists of a president, with a salary of 800L. and a house; a vice-president, with a salary of 500L. and a house; and professors of Greek, Latin, mathematics, history, and English literature, logic and metaphysics, chemistry, physics, and natural philosophy (each with a salary of 200L), modern languages, natural history, mineralogy and geology (each with a salary of 200L), English law, jurisprudence, and political economy, civil engineering, and agriculture (each in 1864), the legal languages, the practice of surgery, the practice of archery, midwifery (each with a salary of 100L). There are also attached to each college a registrar (with a salary of 200L), and a bursar and librarian (each with a salary of 100L). A small number of students are provided with a salary of 200L. The total annual expenditure for salaries is thus (deducting 250L for the professorship held by the vice-president) 5500L.

The remaining 1500L of the annual charge on the consolidated fund is devoted to the payment of scholarships and prizes. An additional sum of 12,000L. had shortly before been granted by Parliament for providing them with libraries, philosophical instruments, and some other requisites. Under the existing constitution, then, the body politic and corporate of each college consists of a president, with a
which was opened for students in October 1833. In 1837 a royal charter of incorporation was obtained by which the style and title of "the Wardens, Masters, and Scholars of the University of Durham" was given to the institution. The charter gave the power of conferring degrees, and confirmed the rights and privileges secured to it by Act of Parliament, usually enjoyed by chartered universities. By the provisions of the above-mentioned act, the chancellor of the university is master; the dean of Durham is constituted warden. To the professorships of divinity and ecclesiastical history and of Greek and classical literature, which are both in the patronage of the bishop, canonicises in the church, and rectors in the parishes, are appointed; and the professors of mathematics, astronomy, the reader in law, Hebrew, history and political literature, and natural philosophy, the lecturer of chemistry and mineralogy, and other officers of the university, are appointed by the dean and chapter. The president of the college is master. Bishop Hatfield's Hall, instituted in 1840, is for divinity students. It has four tutors, one of whom is principal, a censor, and a chaplain. The academical year consists of three terms of not less than eight weeks each, which are called Michaelmas, Epiphany, and Easter Terms. The age of admission to the academical course is from 16 to 21; and for the divinity course, between 21 and 26; beyond this age students must be admitted by special licence. Care has been taken that the necessary expenses of students are defrayed. The number of male students is about 200, and any approach to extravagance is sedulously guarded against. In 1854 an Act of Parliament extended the right enjoyed by the University of Oxford and Cambridge to pursue physic without farther examination, to the graduates in medicine of the University of London. In the same year by another Act, a commission was appointed to draw up regulations for the improvement of Oxford University, and in 1857 a similar one was passed for Cambridge. Under these commissions many valuable improvements have been effected, and more may be confidently expected. Among those effected are the breaking up of the close scholarships (especially those of Wren and Keble College), and throwing them open to general competition; the enlargement of the college grounds by a number of unnecessary oaths: the establishment of private halls; and the abolishing of the oath on matriculation and on taking the degree of B.A.; by which last regulation Dissenters are admitted to the whole advantages of a university education. In Scotland also an agitation is being made for some improvement in the universities.

SCHOLAR. [Tourmaline].

SCHUMACHER, HEINRICH CHRISTIAN, was born on the 26th of June 1800 at Bramstedt in Holstein. He distinguished himself by his mathematical proficiency and by his predilection for astronomy. At the age of thirty he was created professor-extraordinary of astronomy in the university of Darmstadt, which he was called in 1815 to be director of the observatory at Mannheim, and in 1818 he became professor of the same institute, and in 1815 as professor of astronomy and director of the observatory there. In 1817 he was employed by the Danish government to measure the degrees of longitude from Copenhagen to the west coast of Jutland, and those of latitude from Skagen, the northern cape of Jutland, to Laubeng, on the frontiers of Hanover; afterwards continued through Hanover by Gauss. In 1821 he received from the Royal Scientific Society of Copenhagen the direction of the survey and mapping of Holstein and Laubeng, and in that year the king caused a small but excellently furnished observatory to be built for him at Altona, where he resided till his death. In 1824, in conjunction with the English Board of Longitude, he projected a series of meridional and meridian observations of Greenwich and Altona, for which purpose the English admiralty furnished a steam-vessel, provided with twenty-eight English and eight Danish chronometers. In 1830 he was employed in ascertaining the length of the second's period, using the observatory of Greenwich and Altona. He died in 1835. In 1813 he commenced the publication of the "Astronomische Nachrichten," a work that is still continued, and is the only one that serves as a vehicle for the communication of scientific facts and the astronomers of all the world, and contains accurate tables. From 1829 to 1829 he published his "Astronomische Hütten- tafeln," a good example of a carefully calculated ephemera. In 1830 he published his "Astronomische Nachrichten," a work that is still continued, and is the only one that serves as a vehicle for the communication of scientific facts and the astronomers of all the world, and contains accurate tables. From 1829 to 1829 he published his "Astronomische Hütten- tafeln," a good example of a carefully calculated ephemera. In 1830 he published his "Astronomische Nachrichten," a work that is still continued, and is the only one that serves as a vehicle for the communication of scientific facts and the astronomers of all the world, and contains accurate tables. executed a succession of great works, such as would seem more than enough to have tasked the energy and industry of the sculptor as a maidenly and laborious workman whose days had been extended to the longest span, and who had been blessed with the most robust health.

We can name but some of his more prominent works. The southern pediment of the Walhalla at Ratisbon, filled with the design intended to be the doorway from the French, was only in part by him; but the design in the northern pediment, a later work, was wholly by himself, and was of a much higher order of merit. It is called the Hermann-Schlacht, or Battle of Arminius, and is one of the most characteristic and best known works of the period, the figures of the Swiss, Celts, and Germans being realised by the sculptor’s chisel. He also executed some of the statues in the Walhalla, and the fourteen carvations representing the Walkyren of the Teutonic mythology.

For Ludwig’s New Palace (Neue Königsehau), Schwanthaler not only executed several frescoes and statues, but made the cartoons for numerous pictures which were painted in encaustic by Hiltensperger, Streidell, and others. Among these are a series of twenty-four compositions from Iphiclus, twenty-one from Sophocles, twenty-seven from Aristotle, a series from the tales of the Argonauts, another from the ‘Works and Days’ and the ‘Shield of Hercules’ of Hesiod. His most famous piece of sculpture here is however the Myth of Aphrodite, but the story of Venus was never more colorfully rendered, nor in any manner more marked by the various stages of evolution than by Schwanthaler. In the National Gallery, the frieze in relief of the ‘Crusade of Barbarossa’ (‘Der Kreuzzug des Kaisers Friedrich Barbarossa’), placed above the paintings by Schnorr (Schnurr), shows the passionate friendship of these two princes. It is one of Schwanthaler’s best pieces of work. He has also left many bas relievi of Greek Dancers in the Ball-Room; and the twelve colossal gilt bronze statues of the princes of the House of Wittelsbach, in the Throne-Room, &c. For the façade of the Pinakothek he executed statues of twelve of the greater saints. Schwanthaler also designed the New Art-Exhibition Gallery (Neue Kunstanstaltens-Gebäude) he executed a representation of the Arts placing themselves under the protection of Bavaria. For the magnificent Ludwig Kirche at Munich, Schwanthaler executed a large piece of work in the interior, and the facade, which is placed in a row of niches over the porch, and for the ends of the gable two colossal statues of St. Peter and St. Paul. There are also by him in Munich statues, some of them of colossal size, and most of them in bronze, of Count Tilly, Field-Marshall Prince Wrede, Krithaymer, the author of the Bavarian code, and one or two others. But the chief work with which he adorned his native city was his immense statue of Bavaria, which occupies the centre of the Bavarian Hall of Fame (Bairische Ruhmehalle). Bavaria is represented as seated, helmet in hand, shield is stretched out, and holds a laurel crown, the reward of merit; the other presents a sword against her bosom, to defend her independence; by her side reclineth a lion. The statue is considerable in size, and contains a wealth of picturesque detail. The marble is of the finest quality, and is a masterpiece of modern work. The figure of Bavaria is about 60 feet high, that of the lion is nearly 30 feet; the pedestal is 28 feet high; a staircase inside leads up to the head of Bavaria, which is large enough to contain several persons. This vast work was commenced in 1844, but neither the sculptor nor the founder of this unparalleled work [Stölzle, Johann Baptist, &c.] lived to see it placed on its pedestal. It was inaugurated with great ceremony, October 9, 1850. Remarkable as this work is for its size, it is equally so for its construction, for the sculptures are a neutral point and as long as it endures it will be the most impressive monument to his genius. The Ruhmehalle however contains other proofs of his versatile imagination. In the crypt, at the end of the wings of the building are four tombs of the kings, Bavaria, the Palatinate, Swabia, and Franconia; and the frieze contains 92 metopes, all of them designed by him: 44 containing figures of Victory; 40 containing the remaining 46 the arts and occupations of civilised life.

Among important public works which he designed for other places may be mentioned, his grand fountain in the Ventsmarkt, Vienna, around the basin of which he has placed allegorical inscriptions, the stairways to the principal rivers of the archduchy of Austria, pouring their waters into the Danube, which is represented by a colossal figure in the centre; another and finer fountain in the Pleinig, Vienna, in which is five beautifully designed bronze figures of Austria with her four great rivers, the Danube, Vistula, Elbe, and Po; the monument of Carl Friedrich, grand-duke of Baden, with its four allegorical groups, at Offenbach; monumental statues of the Emperors Rudolf von Habsburg at Spire, King Charles John of Sweden, the Grand-Duke Ludwig at Darmstadt, Mozart at Salzburg, Ghitha at Frankfurt, Jean Paul Richter at Baireuth, and many more. One of the more remarkable among a series of twenty statues of eminent Bohemians for a national monument at Libichow, near Prague, which however he left unfinished. Among the works executed for private patrons he can only name his statues of Venus, Apollo, Cupid, Diana, Pan, and Hercules, and his statuettes from the Oracian mythology; statues and statuettes of knights and old Teutonic heroes; and a vast number of portrait and sculptural portraits, busts, and medallions, which are to be found not merely in the princely galleries and churches of Bavaria and Austria, but scattered throughout Germany, and occasionally in England.

Ludwig Schwanthaler died—his feeble frame, it is said, literally worn out by his unceasing labour—on the 17th of November, 1848, having only a few months before completed his forty-sixth year. The above very incomplete enumeration of his works will more than suffice to show the wonderful energy and industry of the man; but it is necessary to examine the works themselves to form a just estimate of the artistic and mechanical merit of such a body of productions. Of course be supposed however that he accomplished the impossible task of carving all these works with his own chisel. From the establishment of his studio at Munich he had about him a large body of pupils, some of whom have have been recorded in the annals of our art. Among these his pupils were by no means the less in his important works that there is an absence of finish, an appearance of carelessness even, which is disappointing to the spectator and injurious to the reputation of the sculptor. In his most recent works, his mind is not so much in the old teutonic fan and history, like his Hermann-Schlacht, or those types of German ideas, such as he has so grandly presented in his ‘Bavaria.’ Among the Orecian deities he falls into the old conventionalisms, or Germanises the Heilcnisch thought.

By his will Schwanthaler bequeathed to the Munich Academy of the Fine Arts his studio, with models of all the principal works executed by him. The studio stands oppo site the church in which he died, in the street named in his honour, the Schwanthalerstrasse, and preserves the extensive collection of his works. It is open daily to the public, and is one of the great art-sights of the German metropolis of art. The Crystal Palace at Sydenham is probably the best model of the Orders of Man, the ‘Shield of Hercules,’ and several other of Schwanthaler’s productions.

SCIENCE AND ART, DEPARTMENT OF. This department of the Committee of Privy Council on Education owes its origin to the suggestions contained in the Second Report of the Commissioners for the Exhibition of 1851. After urging the necessity of the industrial classes of this country receiving more systematic instruction in science and art in order to enable them to maintain their pre-eminence in the world of mechanics, the commissioners expressed on the government the advantages which would result from bringing the various institutions connected with science and art that were supported by the public funds, into close connection with each other, instead of the remaining under different departments of the government. The government took a favourable view of the suggestion; and as a part of the “comprehensive scheme for the advancement of the fine arts and of practical science,” announced from the throne in March 1853, they formed a Committee of the Lords of the Treasury, in March 1853, gave their formal concurrence to the proposed arrangement of the Privy Council to “unite in one department, under the Board of Trade, with the Departments of Practical Art and Science, the Board of Agriculture and Fisheries, Board of Trade and Commerce, Board of Education, Board of Science, the Museum of Practical Oeology, the Geological Survey, the Museum of Irish Industry, and the Royal Dublin Society, all of which are in part supported by Parliamentary grants,” and, the Treasury minute proceeds, "my Lords have
given directions that the estimates for all these institutions shall be brought together under the general head of 'Board of Trade Department of Science and Art.' The immediate purpose of this amalgamation, it was clearly stated, was to bring the whole of the finances under one common superintendence, to establish a central metropolitan school of practical science as well as of art, and to encourage and extend the formation of minor local institutions which should be in connection with the newly established body. (The Royal Dublin Society, the University of Dublin, and the Town Hall, among others, were already on the list.)

As was said above, the institutions thus brought together under one department, were all in part supported by Parliament, and the whole of the revenue voted for their support was appropriated to the amalgamation were: Government School of Mines and Science, 1804; Museum of Practical Geology, 1857; Geological Survey, 1851; Museum of Irish Industrie, 1845; Royal Dublin Society, 1840; Department of Practical Art, including the provincial Schools of Design, 1879; etc.; in all 39,181l.; but the sum actually granted was 41,566l., additions having been sanctioned of 150l. to the School of Mines, and 2350l. to the Department of Practical Art.

Of these institutions the character may be briefly indicated. The Government School of Mines and of Science applied to the Arts was founded in 1801, in consequence of memorials addressed to government by the mining districts of the United Kingdom, in which it was shown that the schools for the education of miners of the United Kingdom, and of the various Continental governments had much increased the economy, efficiency, and safety of mining operations in the countries in which they had been established, and that the want of such schools was very much felt in the mining districts of this kingdom. The Government School of Mines was accordingly opened in connection with the Museum of Practical Geology in 1851. It is now merged in the Metropolitan School of Science applied to Mining and the Arts, which forms one of the two great branches of the department which is the subject of this article.

The origin and purpose of the Museum of Practical Geology were stated under the head Museum of Economic Geology in 1847, and it was shown that it was in 1859 removed to the building erected for its reception in Jermyn Street, St. James's—now the head quarters of the Metropolitan School of Science. Ever since the establishment of the Museum, the Geological Survey of the United Kingdom has been carried on in connection with it, and its extensive collections have been formed, and are continually augmenting, illustrative of the structure of the British Islands, and of the applications of geology to the useful purposes of mankind, and proceeding simultaneously throughout the United Kingdom, and England and Ireland has advanced far towards completion. In Scotland it has, however, made but little progress owing to the maps of the Ordnance Survey of Scotland having been on sale. But in these Scottish countries we may add the Royal College of Chemistry, founded in 1847, it having been, in 1853, transferred to the Department of Science and Art.

The Department of Practical Art was a development, or rather reconstitution of the central Schools of Design of which a full account is given under Design, School of, vol. 1. 473. The Department of Practical Art was created but three years ago, and is composed of the three great institutions in the Department of Science and Art, and before it had come into full operation as a separate institution. The Royal Dublin Society for the Improvement of Husbandry, Manufactures, and other useful Arts and Sciences, was founded in 1731, and incorporated by royal charter in 1749. It possesses a valuable museum of natural history; an agricultural museum; an excellent library; a museum of sculpture, casts, &c. From its establishment, we believe, it has had a short time after its amalgamation with the fine arts, from which many of the best natural artists have proceeded. It has also a good chemical laboratory; and a convenient theatre for the delivery of lectures. The Botanic Gardens at Glasnevin are given over to the Society, and the Geological Gardens, Phoenix Park, are in course of amalgamation with the Department of Science and Art. The Society is conducted wholly by its own council, the duties of the department being confined to supervision and suggestion. The Royal Dublin Society was established by the Government in 1845, and placed under the direction of Sir Robert Kane, so honourably distinguished for investigations in connection with the industrial pursuits of Ireland. In object, the Museum of Irish Industry resembles pretty closely the Museum of Practical Geology, having been established, with an object similar to that of the former institution, and carrying out the extension of that previously adopted by the Royal Dublin Society. Short courses are given during the day, chiefly to the upper classes; and other courses are given in the evenings chiefly to the sons and assistants of persons engaged in manufacturing, and having the expense of models, tools, and models of every course, when prizes are awarded to the more successful students, and a general competitive examination is held at the end of every year. In addition to this, lecturers on science are sent to the provincial towns, and lectures and examinations take place at stated periods in connection with their instruction.

The institutions which were united to form the Department of Science and Art, it will have been noticed, all belonged to England and Ireland. But in 1854 the necessary steps were taken for the formation of a National Museum of Industry for Scotland, similar to those of London and Dublin. A site was purchased by the government near the University of Edinburgh for the building; and the museum belonging to the University of Edinburgh was transferred to the museum. The Museum now has a long list of models, minerals, &c., of the Highland Society, was transferred to the Crown, and thus an excellent basis was obtained for the proposed museum. These collections are at present exhibited in the Royal Institution, and they are given in connection with them by competent professors.

The Department of Science and Art was originally constituted a section of the Board of Trade, but in February 1856 it was, by an Order in Council, transferred to the Committee of Public Instruction on Science and Art. Since that time it now forms a distinct division; its functions having reference to the secondary instruction of all classes of the community in those principles of art and science which conduces to the general advancement of the arts and sciences. The other division of the Committee of Education refers to the primary instruction of the young; the two divisions being kept entirely unconnected. The department itself consists of two sections—a School of Science, with its connected museums and affiliated institutions, having its head-quarters at Jermyn Street, and a School of Art, with its various collections and associated schools, having its head-quarters at South Kensington, where also are the offices of the Department of Science and Art. The amount voted for the Department of Science and Art in 1857 was 73,855l., being an increase of 9160l. over the previous year, and 32,260l. more than the vote for the several institutions prior to their consolidation.

It remains to notice shortly the present position of the two great divisions of the Department of Science, applied to Mining and the Arts, has, in the words of the official prospectus, "for its chief object and distinctive character (to which everything else is subsidiary), to give a practical direction to the course of scientific study." And the course of instruction which is imparted to the student, while it does not profess to qualify him to undertake the direction of mining or other technical operations, is intended, in combination with future training, "to render him in the best degree competent to take charge in any special branch of industry, but to promote its further development." The institution is under the general supervision of a director, Sir R. I. Murchison, the eminent geologist, who succeeded the late Sir H. T. de la Beche, and the instruction is given by professors of Chemistry, Natural History, applied to geology, Physical Science, Applied Mechanics and Mechanical Drawing, Metallurgy, Geology, and Mining and Mineralogy, each of men the highest standing in their respective departments. The mode of instruction is entirely practical, laboratory instruction forming a large part of the course of study. Students are instructed in teaching in the laboratories and drawing office, and by field surveying and geological and natural history excursions. The field of study is separated into—"a general division, for those men who are destined to practice in the general branch of scientific study," and an "applied division;" a technical division for those who propose to engage in arts or manufactures depending chiefly either on chemical or on mechanical principles. For each of these divisions the course of study extends over two years, of three terms in each. Students must be at least 16 years of age.
Schools of Art. 3. To hold public inspections and examinations, and to award medals and prizes to the most deserving candidates.

2. To collect together works of art, pictures, &c., in the central museum and books of art, &c., at the central library. 5. To circulate among the Schools of Art objects from the Museum, and books and engravings from the library.'

The buildings at South Kensington include the offices of the Department, the Training School for Masters and Mistresses, the Normal Central School of Art, the Art Library, and the various Art collections.

The Training School has for its special object the education of Art-teachers for schools, but it is also prepared to supply certificated Art-masters or mistresses to teach drawing to schools in connection with the Committee of Council on Education. The course of studies embraces, besides all the branches of Art-Education, instruction in various direct applications to the mechanical and manufacturing industry. It comprehends the following subjects:—Free-hand, architectural, and mechanical drawing; practical geometry and perspective; painting in oil, tempera, and water-colours; modeling, moulding, and casting. These classes include architectural and other ornamental, flowers, landscape, objects of still-life, &c., the figure from the antique and the life, and the study of anatomy as applicable to Art; and some technical studies, such as enamelling and the decoration of glass, &c. The students have full access to the Museum and Library, either for consultation or copying, as well as to all the public lectures of the Department. Special classes are arranged in order to give a preparatory course to schools and others to teach elementary drawing as a part of general education.

The collections brought together at South Kensington are already of great value and interest, and they are rapidly increasing. The Museum of Ornaments, &c., is somewhat restricted in its present state, and is to be extended and improved entirely by the Department. It was commenced in 1855, when a suite of rooms in Marlborough House was appropriated to it.

The Department has a large collection of objects, both of foreign and of domestic productions, in existence of majolica and other examples of ancient, as well as many admirable specimens of modern, ceramic ware; a fine collection of old furniture of an artistic character; watches, jewellery, and enamels; stained glass windows; casts, engravings, and photographs of fine specimens of ornamental art from the Imperial Collections of France and elsewhere; casts of classical, medieval, and renaissance architectural ornaments, &c. There are also deposited in the Museum building and in the collections connected with it, a large number of animal productions; educational collections; models of patented inventions (deposited here by the Commissioners of Patents); a collection of original statues and casts by British sculptors, placed there by the artists by order of the Department; casts of the works, &c. The very fine gallery of British Art, containing no less than 3234 oil paintings, and a considerable number of sketches, by eminent living, or recently deceased, British painters—the munificent gift of Mr. Sheepshanks to the nation—is also, by his desire, deposited in a building erected for it, in immediate contiguity with the Museum; it has been "given for the purpose, as the primary object, of being used for reference and instruction in the Schools established in connection with the Department of Science and Art." All these collections are open free to the public on three days of the week; on the other three days (being "students' days") the public are admitted on payment of 6d. each person. The collections are also opened to the public free on two evenings of the week—an innovation which has proved exceedingly popular. To the Art Library—a very excellent one—though formed primarily for the students, any person is admitted on payment of a trilling fee, which affords access for a week. Evening lectures to working men are also occasionally given there.

In connection with the Central School of Art there are seven Metropolitan District Schools, and one school for female students only. The provincial Schools of Art have increased considerably in the number of their students. These schools are, like the Schools of Science, in the main self-supporting, but the Department assists in paying the certified teachers, and in various ways aids in providing the school materials, and in rendering assistance to the students. They are now in all sixty-nine in number; and at the last return they were the means of affording instruction in

drawing and painting to upwards of 35,000 students—but this number "includes children in poor schools under instruction in drawing," who can hardly be fair enough to rank as art students. The Department, in fact, now, besides the training which it affords in its central and metropolitan schools, and the Special Provincial Schools of Art in connection with it, proffers the services of a certified teacher in drawing to any school or schools, furnishing an aggregate of 500 children with instruction in drawing. This is to be done gratuitously in aid of the schools of examinations and prizes, at stated periods. It is intended also, as soon as arrangements can be made, further to extend the aid of the central institution to local or rural towns by any class or class of objects contained in the Museum for exhibition and study upon application from the local authorities.

SCIÉ FACIAS. A simpler, less explicit, and less dilatory method of proceeding than that by scié facias, has been established by the Common Law Procedure Acts, 1853 and 1853. The former statute has at the same time extended the period during which execution may issue, from a year and a day to six years. In case of a change by death, marriage, bankruptcy, or otherwise, in one of the parties to an action, the representative of that party may enter a suggestion of the fact, and put himself in his place. The opposite party is also enabled to call upon the representative to do so, and if he fails to stop the proceeding, the possessor shall be entitled to the simple cases of change in the parties to a suit. If it be not adopted, a writ of Revivor, as it is now called, may be issued, the object of which is the same as that of a scié facias. It is, however, directed to the party and not to the sheriff, and must be executed in the county where the scié facias was directed to the sheriff of the county where the science in the original action was laid, and was served by him. The subsequent proceedings in Revivor resemble those of an ordinary action. The writ of scié facias in Chancery to recover patents is not affected by the above-mentioned statutes. Nor is the writ of scié facias itself abolished. In some cases it is still the only method of proceeding; for instance, to enforce a judgment against the terre tenus of a tenant in common.

SCILLITIN. [Chemistry, S. 1.]

SCITAMINACEAE. A natural order of plants embracing the Marantaceae, with 1 anther-valve, and the Zingiberaceae, with 2 anther-valves. The separation of these orders is now generally recognized. [Marantaceae; Zingiberaceae.]

SCOMBERESOX, a genus of fishes belonging to the family Eidosida. The only British species of this genus is the Sea Pike or Skipper, called also Gowndook in Scotland. It is a large fish, like a British bonito, but not an abundant fish, but has been taken off Berwick and Yarmouth, and Portland Island, and on some occasions has been even plentiful on the coasts of Scotland. [Eosed.]

SCOPULIDAE, a family of Malacostracous Abdominal Fishes, commonly called anemones. They have the snout short, the mouth deeply cleft, the teeth rather small and sharp; the branchial rays 8 to 16; the first dorsal behind the ventral; the body in some is semitransparent.

The genus Scopulus is found in the Mediterranean.

SCORESBY, WILLIAM, was born in 1790, and commenced his nautical life only ten years afterwards, accompanying his father, William Scoresby, the distinguished Polar navigator, in the Danube, on her voyage of the year 1800. The passion for naval enterprise which the child's examination of the ship had evoked, was confirmed by his first voyage, and in 1803 the father and son sailed together in the ship Resolution of Whitby. They continued to do for the ensuing eight years, the sedulous junior keeping a regular journal of their voyages. He was promoted in succession, as he became qualified, without being minors and purchased, through the grades of the service, until he was second lieutenant of the ship, which responsible office he held in his sixteenth year. The long intervals during which, from the nature of the whale-fishery, the ships were laid up in winter, were devoted by the father to the encouragement of his son's great satisfaction of his father, to regular study, and for a considerable portion of two sessions, at Edinburgh, where he secured the friendship of the late Professor Jamieson and other professors at the university, and also of Dr. (now Sir David) Brewster. He thus acquired that definite knowledge of the principles of the various branches of science bearing upon his peculiar profession, which enabled him to extend them, by his own observations, in the voyages to the Arctic regions which accompanied with and succeeded these periods of intellectual culture.

While filling the stations respectively of commander and chief-mate of the Resolution in 1806, the Scoresbys sailed to a higher latitude than had been attained by previous attempts. They were unsuccessively in 80° 50' 25" N., Lat., 61° 1' 55" and 61° 12' 42", and, once by estimation, as far as 61° 30', the nearest approach to the pole,—within about 510 miles,—at that period authenticated. It has been exceeded only by the voyage of Dr. (now Sir) George Warren in the Vega, who, in his celebrated boat expedition, during his fourth voyage, in 1837 reached 82° 45', the highest point yet attained; but this was accomplished by travelling across the ice, which had to be commenced on gaining the latitude of 79° 50' 30'; inferior to that attained by the Scoresbys by ordinary sailing, and the honour still remains theirs of having in ordinary sailing navigated the highest northern latitudes. It may be remarked here that the boat expedition had itself been adopted from a suggestion made by the younger Scoresby (in a proposition which had been rejected by the Admiralty), but had not, in his opinion been properly executed. It was always his conviction that by such expeditions, if carried out according to his views, the pole could be realized, and that the most valuable result would have been the satisfaction of learning that Parry himself had expressed the same conviction. It is proper to note in this place, in order to preclude error, that the sovereign of the Resolution in this voyage, states, in an "Account of a Voyage to the Arctic Regions," published by Scoresby, that he had the satisfaction of learning that Parry himself had expressed the same conviction. It is proper to note in this place, in order to preclude error, that the sovereign of the Resolution in this voyage, states, in an "Account of a Voyage to the Arctic Regions," published by Scoresby, that he had the satisfaction of learning that Parry himself had expressed the same conviction. It is proper to note in this place, in order to preclude error, that the sovereign of the Resolution in this voyage, states, in an "Account of a Voyage to the Arctic Regions," published by Scoresby, that he had the satisfaction of learning that Parry himself had expressed the same conviction.

In consequence of information communicated by Captain Scoresby to Sir Joseph Banks, the President of the Royal Society, the attention of the council of that learned body and of the government was directed in 1817 to the dormant enterprise of endeavouring to reach the North Pole and to explore the unknown regions of the Arctic Ocean; the latter of which objects has at length been accomplished by Sir Robert McCullogh in one of the recent searching expeditions for the ill-fated Franklin. Sir Joseph Banks was very desirous that his young but experienced friend Scoresby should be selected for the hazardous task of having deferred the sailing out of the ship Famine, which the son was to command, under the idea that she might be taken up for service. Their expectations however were altogether disappointed, and as it was well known, Captain (the late Sir John) Ross with the Isabella and Alexander, and Captain Buchanan with the Dorothea and Trent, were appointed to make the attempt. It appears to be the policy, as perhaps to be discouraged on grounds of national juncture, however the consequences of it may be, that particular instances of the Board of Admiralty, to reserve those arduous expeditions and others destined for marine scientific research, as the encouragements and rewards of an inevitably laborious and ill-paid service. The history of this subject will be found in a paper by Dr. Scoresby, "On some circumstances connected with the Original Suggestion of the Modern Arctic Expeditions" published in the Edinburgh New Philosophical Journal, vol. xx. 1830-36.

Having completed his voyage to the Spitzbergen and Greenland-Whale-Fishery, Captain Scoresby published, in 1820, his celebrated work entitled, 'An Account of the Arctic Regions, with a history and description of the Northern Whale-Fishery,' in 2 volumes consisting of 1,217 pages and 137 plates. This work was received with great satisfaction by the scientific world, and has been taken at the suggestion of Professor Jamieson, who did service to scientific literature by stimulating his pupils to apply research to the results of the observations made by them in their professional or official employment in distant countries. This was the first original work on the
physical and natural history of the countries within the Arctic circle and on the nature and practice of the Whale-Fishery, published in this country, with the exception of a tract by Henry Elking on the latter subject. It obtained for the author a more general reputation than he had hitherto enjoyed, and justified the wisdom of the whaling shippers when they commanded, in countenancing a degree of enterprise in geographical discovery—not unconnected however with the object of the trade—which had not before been united with the pursuit of whales, except through accidental circumstances. He returned from a voyage in 1822, in the ship Baffin of that port, undertaken with these views, he received on entering the Mersey the afflicting intelligence of the decease of his (second) wife who was absent. He now quitted the whale-fishery, but published a Journal of a Voyage to the Northern Whale-Fishery, including researches and discoveries on the eastern coast of West-Greenland, made in the summer of 1822, in the ship Baffin of Liverpool, in 1823, 615 pages, with 8 plates, including a chart, &c. A German translation by Professor F. Kries was published at Hamburg in 1825. Not long after the appearance of this work, on the 17th of June, 1834, he was elected a Fellow of the Royal Society, being already a Fellow of the Royal Geographical Society; and having been for some years a Fellow of the Royal Society of Edinburgh. He subsequently received one of the highest honourary rewards of scientific eminence, in being made a corresponding member of the Institute of France, or Académie des Sciences; and the various questions, which he had so successfully solved, round about Edinburgh, he had been a remarkable man. His crews were always distinguished by their discipline and respectability, and the lasting effect of his command upon the characters of some of those who served with him, is evident from his own judgment, tempered with heart. His success in whaling was remarkable; but he never, under any circumstances, allowed a whale to be pursued upon Sunday, and he succeeded in convincing his men that upon the whole they did not lose by keeping to his rules. In his later voyages he adopted the temperance principle on board his vessel, finding that hot coffee was a much stronger preservative than spirits against the intense cold of Arctic regions.

Some years after his retirement from the whale-fishing the religious impressions which he had first received from his father and had always entertained, impelled him to desire a more formal and authorised position as a teacher of religion. He entered the University of Cambridge as a student of Queen's College. Orders in due course, taking the superior degree of D.D. in process of time. The Mariner's Church at Liverpool having been then established, he accepted the chaplaincy. Private circumstances, however, prevented his taking vicar of Bradford, a very large parish in Yorkshire. After some years however he resigned this office, and retired to Torquay in Devonshire.

As a clergyman, Dr. Scoresby is stated to have "combined what may perhaps be considered extreme evangelical views with the most abounding charity and liberality to those who differed from him. His "Discourses to Seamen" evince the earnestness with which he laboured for the good of the service in which he had passed his earlier years." He took also enlightened and enlarged public education, while vicar of Bradford he laboured zealously to realise.

But of all the very various subjects to which Dr. Scoresby directed his attention, practical magnetism and its relation to navigation appear to have been most actively pursued by him in the course of his life. He had early become interested in the subject, and his magnetic investigations have been the most important to which he contributed, the principles effecting the capacity and retentiveness of steel for the magnetic condition; with the development of processes for determining the quality and degree of hardness of steel. London, 1839; 92 pages, 2 plates. Part II. "Comprising investigations concerning the laws or principles affecting the power of magnetic steel-plates or bars in combination, as well as singly, under various conditions, to attract, mass, harden, quality, form, &c., as also concerning the composition of cast-iron." London, 1843; 250 pages, 2 plates. Vol. ii. part iii. "Investigations, with illustrative experiments, on the nature and phenomena of magnetic induction, and the mutual influences of the magnetic poles. "With figures and plates.

To the section of Mathematics and Physics of the meeting of the British Association at Glasgow in 1855, he communicated a summary of his matured views, and of the evidence in their favour which had occurred since their original publication, concerning the various effects and properties of the Magnetism of Iron ships and its changes." He also recalled attention to his plan of a compass aloft, as affording a simple and effective mode of ascertaining the direction of a ship's course, stating that it had not only been extensively adopted by some of our first firms interested in the building and property of iron ships, but had received the particular sanction and commendation of Mr. Airy, the astronomer-royal, and of Lieutenant M. F. Maury, the American hydrographic officer. He had been invited by some gentlemen for adoption for determining safe compass guidance, or the correction of adjusted compasses whenever they might be found to be in error." In the further prosecution of his researches on this subject, and with the view to determine various questions of scientific and practical importance to mariners in his age a voyage to Australia in the Royal Charter. He was received at Melbourne with great distinction, almost with enthusiasm, and was granted the honorary degree of M.A. by the University of that city. He returned in 1856, but with his constitution much impaired, making a tedious journey to the arduous labour to which he had subjected himself during the voyage; and after a lingering illness he died at Torquay, on the 21st of March 1857, aged sixty-seven, and leaving a widow.

Three principal scientific works of Dr. Scoresby have been described above. The following enumeration will render the account of his separate publications nearly complete.

1. Memorial of an Affectionate and Dutiful Son, Frederic R. H. S., who fell asleep in Jesus December 31, 1834, and 16 years. 2. Discourses to Seamen: consisting of Fifteen Sermons, preached in the Mariner's Church, Liverpool, treating for the most part generally on subjects of Christian Practice and Duty, by the Rev. Mr. Scoresby, preached in St. James's Church, Liverpool, on the 12th of August 4, 1850, on occasion of the Meeting of the British Association. 3. Memorials of the Sea: 1, 'Sabaths in the Arctic Regions;' 2, 'The Mary Russell.' Of both these two volumes, the latter contains the portion of the Author's book on the Adventurous Life of the late William Scoresby, Esq., of Whitby,' 12mo, Lond., 1831, pp. viii. and 332. 4. The Franklin Expedition; stating his views on its probable course and fate, and on the measures of search for it.

Zeistic Magnetism. The contents of this work on a peculiar subject are thus stated by the author himself: "Original Researches in Memetic Phenomena, with the view of eliciting the scientific principles of this mysterious agency, and in which experiments are described, eliciting strong electric or magnet-electric conditions, with the interpreting of the memetic influence by electricity, and the neutralising of the effects of substances having an ungenial influence on the subject, by the same process as was found to neutralise the electricity of sealing-wax, &c., as acting on the electroscope.

Dr. Scoresby had prepared for publication prior to his decease, a work fully detailing the results of his most recent investigations in nautical magnetism. As he contemplated, while preparing this work for press, the continuation of the series of 'Memorials of the Sea,' in which the story of his own life should be told, it is not improbable that this also may find a place in the work, which had not appeared in 1836.

SCORZONERA. A genus of Plants belonging to the natural order Asteraceae. The pappus is feathery, in several rows, Bracts imbricated. Receptacle naked. Achenia neither stalked nor beaked, with a lateral seg.

S. Hispanica, Viper's-Grass, has a cylindrical succulent root, branches monoequidius; leaves amplexicaul, lanceolate, wavy; involucres smooth; flowera yellow. It is found

Prince Wrede was defeated. Napoleon afterwards gave him the command of the 6th corps, and ordered him to defend the right bank of the Rhine, at Cologne; but he was obliged to fall back into Holland, where, however, he had not included his name in their list of proscription. In 1819 he was chosen deputy for Corsica, and soon became distinguished as a member of what was termed the liberal opposition in the French National Assembly. In 1826 he succeeded General Foy as representative of the department d'Aisne. After the revolution of 1830, Louis Philippe, in August, appointed him minister of marine, and in the following November, on the retirement of Mole, made him minister for foreign affairs; in which office he continued until 1832. It was during his administration of this office, in September, 1831, that he incurred so much obloquy by his famous announcement from the tribune of the chamber that "order reigns in Warsaw." In 1838 he was sent to Syria as minister to the Levant, and was recalled in 1841. He was sent to Algeria in 1841, and was succeeded by a son of his, who died in 1844. After the death of his son, he continued to live in Paris, and was for some time in very poor health. He died, however, suddenly while at breakfast, on July 20, 1851. He was buried in the church of the Invalides, and during the funeral some of the grenadiers carried the coffin on their shoulders. He left a widow and five children. His death was mourned with deep regret by his countrymen.

SEBASTEN PLUMS. [CORDIA, S. 2; CORDIACE.] SEGALTE, a genus of Grasses, to which the cultivated Rye belongs. The flowers are arranged on a spike; the spikelets are 2-flowered, with a long stalked rudiment of a third floret; the glumes are subulate. In other respects this genus strongly resembles Trisetum, to which the Common Winter-Rye belongs. [Tartaric.] S. cereale, Rye, has the glumes 1-nerved and shorter than the spikelet; the rachis is very tough. This plant is extensively cultivated in Europe, and nowhere has been observed in its wild state, except in a few scattered places, away from the possibility of escape from cultivation, brought there by the sow. [Rye.] S. montanum has the rachis hairy, brittle; glumes with a short point; the root fibrous. It is found on the gravelly mountains of Sicily. S. Millerianus is also a European species, in which the spikelets are 4-flowered, and the glumes have 2 or 3 strong ribs. It is found in France.

SECRETIONS OF PLANTS. [SECRETIONS, VEGETABLE.] Although the term secretion is generally connected with the idea of separating for the purpose of throwing off or getting rid of a product, it is very manifest that such a use of the term would restrict its application to the substances which, amongst animals, are called excretions. It does not appear that these terms are used in a similar sense in the vegetable kingdom. It is more than probable that the common excretions of plants are more than another in the vegetable kingdom. It is true that a theory of the practice of "rotation of crops" supposes it to depend on poisonous excretions given off by the roots of one plant which are not poisonous to another. But the facts are not so simple as this theory would appear to be. In other words, the chemical forces in action during secretion are stronger than in animals. All the important secretions of plants are compounds of the four organic elements: carbon, hydrogen, oxygen, and nitrogen. These enter the plant in the form of carbonic acid and ammonia. Out of these compounds the various substances which the wood of plants, the nutritive value to their seeds, roots, and other parts, the colour and scent of their leaves and flowers, with the medicinal virtues of many special plants, are formed.

First, Nutritive or Assimilable Secretions, that is, substances which have been forming in the plant, for use for forming its tissues, and constructing the mass of which it is composed. These are the substances which are employed: cellulose, starch, sugar, oil, and protein. The first four are distinguished by containing the elements carbon, hydrogen, and oxygen, whilst the latter contains in addition nitrogen. [Cellulose; Starch; Sugar; Oil; Protein, in Flora, Organic, S. 1.] These substances are found universally in the vegetable kingdom. No cell can be formed without one of the ternary compounds, and a portion of the quaternary substance in some form. Hence they are called Ternary Nutritive Secretions. These substances are also easily convertible one into the other; the sugar may be converted into starch or cellulose, and vice versa, and thus their powers are commingled functionally and continuously with the assimilative processes of the plant.

The second class of substances are called Non-Assimilable or Special Secretions of Plants. They are substances which do not play a part in every part of every plant. When once formed they are not used up. The dead leaves of the plant never converted into the nutritive secretions; hence they are called non-assimilable. Some of these substances are very generally diffused amongst plants, as chlorophyll, which is the substance which gives the peculiar green to the leaves and other parts of plants. [Chlorophyll, in Flora, Organic, S. 1.]

These secretions are very numerous, and may be classified under certain general heads.

1. Colouring Matters. To this head may be referred chlorophyll; the colouring principle of the petals of plants seems also to be a modification of this substance. There are however other colouring matters in plants, such as those used by the dyer, and which do not give any colour to the plants in which they exist, which have nevertheless a very definite chemical composition, and by combining with various other substances produce the colours used by the manufacturers of coloured cotton, linen, silk, and woolen cloths of various kinds. These colouring matters would appear to be related to the decomposition of the assimilable secretions, as many of them bear a close relation to both the ternary and quaternary forms of these secretions.

2. Aromatic Matters. Having an acid reaction, and capable of combining with the oxides of the metals, are very common in the vegetable kingdom. The most familiar forms are those which occur in fruits, as the oxalic, citric, malic, and tartaric acids. Oxalic acid is found in the Ocaulis Ascocaria, hence its name, and other forms of Omodiscus. It is also found in the Caususane and Polygynaceae. In the latter order it exists in the species of Rhamnus (Rhubarb), used for making pies, and also in the Sorrel (Rumex). In all these cases it is combined with the oxide of some metal, either the potassium or calcium. In sorrel (Rumex acetosa) it exists as a quinate, or rhamnose potassium, which, when separated, is called Salt of Sorrel. In the Caususane it exists as an insoluble oxide of lime, in the form of raphides. These are crystals of lime, which have a transparent line in the middle, and are very common in the vegetable kingdom. Citric Acid is found in the fruits of the order Auranthus, as the lemon, orange, lime, shaddock, &c. It is easily separated from these fruits in a crystalline form, and is used in the combinations with the oxides of the metals, hence it does not occur as oxalic acid in the form of raphides. Tartaric Acid is found in the juice of the grape. Though closely resembling citric acid, it differs in forming an insoluble compound with potash. In all these cases it is used as a preservative for the fruit and of the tartar of the shops. This salt is deposited whenever grape-juice is allowed to stand. It forms the basis of the tartar of wine procured from the less. This property of tartaric acid makes the product of the latter difference from the former, from which to make wine. The juice of fruits containing citric acid, whose salts are soluble, are much less fit for wine-making. Malic Acid is the acid found in the apple,
and which gives the sour taste to verjuice, as also to the fermented juices of the apple and pear—cider and perry.

The acids generally occur in combination, and sometimes supplant each other. Even mineral acids will sometimes take the place of organic acids; thus sulphuric acid is sometimes found combined with morphia in the place of meconic acid. On the other hand, the metal oxides and the metallic oxides with which they may combine take the place of the alkali, and be found in combination with the organic acid. In the instance however of gallic and tannic acids, there appears to be no combination with alkalis or alkaloids. Tannic acid, formerly called tannine, is found very generally present in the woody parts of plants. It is supposed to result from the decomposition of cellulose. Theoretically, it may easily be formed out of carbonic acid and water. Whether it passes through the stage of cellulose is doubtful. It is of great use in the arts, especially in tanning and dyeing, and for these purposes it is obtained from the bark of oak, elm, willow, sumach, and other trees. It exists in the fruits of the Chrysobalanaceae, and the legumes which are called 'divi divi.' The vegetable extracts called oak tannin, tannin, and the exudations which are sold by the name of kino consist principally of tannic acid. This acid is converted into gallic acid by oxidatio-n. Such a process takes place during the formation of the galls produced by the puncture of insects in the buds of many of the species of Quercus, especially Q. infectoria. These excrections are called gall-nuts, and from the presence of this acid in them it has been called gallic acid. [Gallis.]

The alkaloids are substances found in the leaves, fruits, bark, and other parts of plants. They are some of them present in species of plants which possess other alkaloids, but more generally diffused. Many of them possess extraordinary properties in relation to the animal kingdom, producing poisonous effects; such are strychnin, from the Strychnos Nux vomica; morphia, from the Papaver somniferum; and cocaine, from the Conium maculatum. These substances are always found in combination with organic or mineral acids. There is however another class of substances closely resembling these in their composition and action, which do not combine with acids; they are called free bases. Of these there is the principle of the galls, which in this respect is the same as thethein, the principle found in tea, coffee, and Paraguay tea; and theobromine, the principle of cocoa.

The volatile oils are another group of secretions of great interest. They differ in composition and character from the non-volatile oils, and are also generally associated with the active secretions. They are many of them used as perfumes—others as stimulant medicines, and are remarkable for the interesting compounds they can be broken up into by the agency of chemistry. Their investigation is throwing much light on vegetable chemistry. [Oils.]

The resins are a group of substances standing in a similar relation to the fixed oils, as the volatile oils. They do not appear to be assimilable, they are only occasionally formed, and present special properties in particular plants. They are often combined with gum, forming the substances called gum-resins, and from this combination it may be supposed they are directly formed from the tarry assimilable secrections. When occurring with gum, as in the case of the gum-resins of Canaean, or as the resins of the Coniferæ and in Myrrh, they are combined with volatile oils, which appears to give them their peculiar odours, savours, and action. In the Coniferæ the volatile oil is the principle of the gummy, or resinous, part of the tree, and is used in the arts under the name of oil or spirits of turpentine. [Coniferæ.] Wax is another substance very commonly found in plants, and having relation with the fixed oils. [Wax.] Cearacha and Gotta-Percha are also composed of non-assimilable substances and are remarkable for the absence of both oxygen and nitrogen. [Cearacha; Ionomandra, S. F.]

Although the processes by which these products may be gradually elaborated in the vegetable kingdom may be very numerous and much more complicated than any process with which we are at present acquainted, we can readily explain the formation from the carbonic acid, water, and ammonia, taken up by plants, and the loss of oxygen.

The following tables illustrate this process, with regard to several of the substances mentioned:

It should not however be lost sight of that other elements besides the four organic are constantly found present in the secretions of plants. Sulphur and phosphoric acid are found in fibre, casein, and albumen. The alkaloids and alkaline earths are found very commonly associated with all these secretions, and it is very certain that plants will not form their secretions unless the inorganic elements are present. [Savo; Rose.]

SEDGE, SEDGES. [Cladium, S. 1; Cypriaca, M.]

SEDGLEY. [Staffordshire.]

SEINE-MARITIME, a department in France, recently constituted with Havre for its chief town, extends along the coast of the English channel from the Seine to the Bresle. It is formed out of the coast portion of Seine-Infrérieure, which bounds it on the south. The Bresle separates it from the department of Somme. It is divided into five arrondissements: Havre, Fecamp, the new of Dieppe, and Tréport. Ettretat and Criel, a small coast village, west of Tréport, are made chief towns of cantons. The tribunal of commerce of St.-Valery is suppressed, and that of Yvetot transferred to the more important town of Bolbec. A change has also been made in the limits of Seine-Infrérieure, to which that portion of the territory of the department of Eure that lies east of the Seine to the Epte is added. Seine-Infrérieure, by this arrangement, has Seine-Oise to the south-east; and holds the new two new arrondissements, Eibouf and Gourary, chiefly formed. At Gournay, the railways authorised to be made from Amiens to Rouen, and from Beauvais to Tréport, through Amale, are to meet. In the absence of any material return, it is only proper to offer any conjectures as to the area or the population of the new department; though these may be very nearly ascertained by consulting the articles Eure and Seine-Infrérieure, which have been described as they stood previous to the recent alterations.

SELENAULIDE. [Chromatitis, S. 2.]
SENEGUNGE. [CHEMISTRY, &c.]

SEPARATE PROPERTY. The savings and earnings of a wife may become her separate property at law; and she may deal therewith as a feme sole, either where an order has been made to that effect under the statute 20 & 21 Vict. c. 56, or a judicial separation has been obtained by the wife [DIVORCE, &c. 3; JUSTICE OF THE PEACE, &c.]

SEPARATION, JUDICIAL. Until the statute 20 & 21 Vict. c. 56, divorces a vinculo, which put an end to the marriage altogether, were not obtainable. Act of Parliament, while the legislature would not pass in favour of a husband, until after a sentence of separation a menset et thoro in the ecclesiastical court, and would not pass at all if his conduct had not been free from reproach. [DIvORcOx.]

Either a divorce a vinculo, or a judicial separation, is obtained on the ground of adultery, cruelty, and certain other causes, a divorce a menset et thoro.

The remedy now given in such cases by the Court for Divorce and Matrimonial Causes is termed a judicial separa-

tion. This, like a divorce a menset et thoro, does not dissolve the marriage; it does not bar the wife of her dower, for instance; it effects only such a separation of the parties as leaves it open to them to come together again. But it relieves the husband from all liability for his wife; and he cannot sue in her name; he is deprived of the benefits of his own property and earnings, as freely as if she were a feme sole.

This kind of separation may be obtained on the ground of adultery or cruelty, or desertion without cause for two years or more, or other misconduct, as an absolute and final settlement of the affairs of both parties, which may be reversed at any time afterwards, if obtained in the absence of the defendant, on its appearing that there was reasonable ground for the alleged desertion.

In either of divorces or judicial separations, the Court may, if it shall think fit, order that the husband shall secure to the wife such sum as it shall deem reasonable. The allowance which may thus be made to a woman for her sup-

port out of the husband's estate, is to be reasonable, which is cre-
ted by the Court, at all the circumstances of the case, and to be proportioned to the rank of the parties.

SEPPINS, SIR ROBERT, F.R.S., the distinguished naval

architect, received his education as a shipwright under Sir John

Henslow, surveyor of the navy, and continued in connection with the important service of our dock-yards during a period of fifty years. He was the author of many improvements of the first order in our naval architecture, including the system of winged hulls, as seen in our 74-gun ships. He was master shipwright of Chatham Dockyard. This system formed the subject of two memorable papers in the 'Philoso-

phical Transactions' of the Royal Society, for the years 1814

and 1816, one of which, 'A new system of winged hulls,' delivered Dr. T. Young, For. Sec. R. S. [Young, Thoma-

s] in the former, and which attracted an unusual amount of public attention. The great principle of this method was such an arrangement of the principal timbers as would oppose a powerful mechanical action to every change of position of the ribs and other timbers in every part of the ship, thus firmly compacting together the entire fabric, and preventing that perpetual racking of beams and working of joints which in the ancient system of ship-building, produced hogging, creaking, leaking, and rapid decay; and filling up likewise every vacancy between the timbers, which are occasion-

ally the unavoidable receptacles for foul air, filth, vermin, and various other sources of rottenness and disease. These improved methods led to certain results, both with respect to the prejudices of the older shipwrights, a body of men who have not sufficiently valued and understood, in this country at least, the just principles of mechanical action, in the practical operation of ship-building, were universally adopted in the navy under the enlightened administration of Mr. Charles

York, and the powerful advocacy of Sir John Barrow in the Quarterly Review;' and the merit of their author was acknowledged by his appointment as surveyor of the navy, and by the award of the Copley Medal of the Royal Society, which he became a Fellow on the 10th of November

1814.

While the claims of Sir R. Seppins to the invention of the system of diagonal bracing in naval architecture is indi-

cated, and the importance of place to record here the follow-

ing point of information. It can be no derogation to the

merits of discoverers or inventors to show that their progress in a portion of the general advance of the human mind. Sir John F. W. Herschel has stated in a letter to Mr. G. R. Weld, Assist. Sec., R.S., inserted in the 'History of the Royal Society' by the latter, that he is "disposed to think that the system of triangular arrangement adopted by Sir W. Herschel in the wood-work of his great telescope, being a perfect system of diagonal bracing, is a principle which, when the "diagonal bracing" system owes its strength, was original with his father at the time of its construction, that is about the year 1766. Sir Robert Seppins introduced other improvements into our system of naval architecture. The admiralty presented him with 1000L as a reward for his simple yet most useful invention of an improved block for supporting vessels, by which their keels and lower timbers were much more easily held, and promoted the interest of this art. Finally, when he filled the office of master-shipwright assistant in Plymouth dockyard, and is described in the 'Transactions of the Society of Arts' vol. xxii. p. 275-292, the Society having awarded him their gold medal for it in the year 1804. His plan for lifting masts out of the steps, which superseded the employment of sheer bulks for that purpose, has been the means of saving much expense and labour. His new mode of framing ships has led to a much more extensive use of short and small timbers, which are formerly of very little value; but the most valuable of all the reforms is the construction for which the navy of England is indebted to him was the substitution of round for flat sterns, which afford increased strength to the frame-

work of the ship, greater protection against pooping in heavy seas, and a more ready means of recovery by the bow, a more secure and effective position for the rudder, and a stout platform for a powerful battery, embracing a sweep of more than 180°. This capital improvement was strenuously opposed by many distinguished naval officers, and no reason was given, save the propriety, for which were better suited for their purposes of state than of service, but the good sense of less prejudiced judges, happily prevailed, and secured for our ships of war an additional claim upon the supports of the nation. Sir R. Seppins was, besides, on finance of the House of Commons on several occasions testified his respect to his official merits, and he received the marked approbation of both houses of parliament.

Foreign nations were not tardy in acknowledging the value of the improvements in ship-building originated by Sir R. Seppins, and their author received many substantial proofs of their sense of his merits; the Emperor Alexander of Russia, and the kings of Denmark and Holland, presented him with memorials of their appreciation of what he had done, and supported. In the national record of the great benefactors of their country, there are few names which will deserve more grateful commemoration than that of the object of this notice. In addition to the papers on the diagonal bracing, which were published under the name of Sir R. Seppins, communicated to the Royal Society a paper 'On the principle of constructing ships in the mercantile navy,' which was inserted in the 'Philosophical Transactions,' for 1810. Dr. Young's paper, also referred to above, though not communi-

cated to the Royal Society till 1814, had been presented in the form of a report to the Board of Admiralty in 1811. It will be found reprinted in Dr. Peacock's edition of the 'Mis-

cellaneous Works' of Young, (vol. 1. p. 656-662) together with the official correspondence relative to it between the latter and Sir J. Barrow. Sir R. Seppins was an honorary

member of the Cambridge University Philosophical Society, and a corresponding member of the Philosophical Society of Rotterdam. It had been proposed by the University of Ox-

ford to erect a statue of Sir R. Seppins, but the proposal was not carried into effect, the commemoration of 1836, but severe indiscipline compelled him to decline it. He died at his house at Taunton in Somersetshire, on the 25th of April 1840, aged seventy-

two, leaving several children; his wife's dease had taken place a few years before.\(^\text{5}\)

SERICA. [MELIOLITHUM.]

SERICOSTOMA. [PLACIPENNER.]

SERICULUS. [MELIULIDE.]

SERPENTINE. As a mineral Serpentines, although rarely, in the quartziferous rocks of the Alps, Italy, and the Near East, is usually greenish and compact in texture, and of a dark-green or blackish-green colour. It also occurs in fibrous and lamellar varieties. Its hardness is 2.5 to 4, and it may be cut with a knife. Its presence in the gem trade becomes you play away on exposure, and feels sometimes a little mucus. The fol-

lowing varieties are recognised:

Precious Serpentine.—Purer specimens of a rich oil-green
colour, and translucent, breaking with a splintery fracture. It is a beautiful stone when polished. It has the following composition:

- **Silica** 42:5
- **Magnesia** 44:2
- **Potas. of Iron** 0:8
- **Calc. Acid** 21:9
- **Water** 12:4

Total 100:0

It gives off water when heated; becomes brownish-red before the blow-pipe, but fuses only in the edges.

**Common Serpentine.**—Opaque, of dark-green shades of colour.

**Picrolite, Schiller Asbestos.**—A Fibrous Serpentine, of an olive-green colour, constituting seams in Serpentine. The fibres are longer, finer, and brighter. It resembles some forms of asbestos, but differs in its difficult fusibility. Thomson’s *Baltimorite* belongs here.

**Marmolite.**—A Foliated Serpentine, of greenish-white and light-green shades of colour, and pearly lustre, consisting of thin folia rather easily separable. The folia are brittle, and the variety is thus distinguished from talc and brucite. It has the following composition:

- **Silica** 40:1
- **Magnesia** 40:1
- **Potas. of Iron** 27
- **Water** 15:7

Total 99:9

**Kerolite.**—Near Marmolite, but folia not separable.

Serpentine is a very handsome stone when polished. Beautiful specimens from Cornwall, and other parts of England and Ireland, may be seen in the Museum of Economic Geology, London. When mixed with limestone it constitutes the Verdonite and the Marble. It does not melt well, although at first it receives a fine polish. Chromic iron is usually found disseminated through it. Dr. Jackson of America has shown that Epsom salts or sulphate of magnesia may be profitably manufactured from Serpentine.

**Serrutula, a genus of Composite Plants of the order Cynaraeae, and the section Serratulae.** The heads of flowers are discaceous by abortion; the involucres are imbricated, slender and winged; the scales of the receptacle split longitudinally into linear bristles; fruit compressed, not beaked near the base; oblong oblong oblique; the pappus persistent. There is but one British species of this genus, *S. tinentia*, the Saw-Wort. (Sibbington: *Manual of British Botany*).

**Servia or Serbia**, a political division recently formed by decree of the emperor of Austria, consisting of portions of South Hungary and Slavonia. It is styled the Woivod-ship of Servia and Temesvar Banat, and includes the Banat of Temesvar (comprising the counties of Bacău, Bodrog, Torontal, Temeswar and Krassow, the principal towns of the territories of the Bacsa and the Banat), and the Syrmian districts of Ruma and Iliok. The emperor is styled Grand-voivode, and the actual governor Vice-voivode, who resides in Temesvar, and is assisted by a ministerial council. This council is composed of one representative from each county, and is a self-appointed body. The voivode-ship is divided into 6 districts. It has an area of 11,528 square miles, drained by the Maros, the Temes, the Theiss, and the Danube; the population amounts to 1,425,321.

**Servitude, Penal.** This punishment has come in place of the former punishment by *transportation*, said to have been established by the *Car. II.* c. 5, s. 2, enabling the judge of assize to transport certain offenders to America, to remain and not to return. The *Car. II.* c. 5, s. 4, gave the judges power, "at their discretion," to grant a reprieve, and to cause felons to be transported beyond the seas, there to remain for the space of seven years; but if the offender refused to be transported, or returned within the time, then he was to be put to execution under the *Car. II.* c. 7, s. 4, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. II.* c. 6, 2 & 3 *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years. The *Car. III.* c. 11, directed a judgment of transportation to be entered, when the felon elected to be transported, and it authorised the sheriffs to cause offenders to be embarked. It also made a return before the expiration of four years.

The next statute on the subject was the *Car. III.* c. 11, "a foundation of the law of transportation," which enacted that, when the Crown was pleased to extend mercy, upon condition of transportation to any part of America, any court, having proper authority to do so, might direct the offender to be transported. The *Car. III.* c. 21, directed the Crown person *at large* in Great Britain, before the expiration of the term of transportation, liable, on conviction, to suffer death. The 8 Geo. III. c. 15, extended the powers of the judges to make orders for transportation by enabling them to do so by a special order by the statute. The King was empowered to authorise the governors of convict settlements to remit the sentences of transports. By the 8 Geo. IV. c. 54 (amended by 11 Geo. IV. and 1 W. 3 Will. IV. c. 60), consolidating the laws on the subject of transportation, the King in council was empowered to appoint places beyond the seas, to which persons under sentence of transportation should be conveyed, the governor or other person to whom they were delivered, or his assignees, having the power of selling or hiring them out, and to cause them to be transported, the King in council also empowered by warrant to appoint places of confinement at home, either on land or on board vessels in the Thames, or other rivers or harbours, for the confinement of male offenders (recently extended by the stat. 16 & 17 Vict. c. 67, for under sentence of death, but reprieved or respited, or under sentence of transportation, there remain to be transferred under the order of the secretary of state, or to others in his behalf, or for the benefit of their own home. These applications were usually called 'tickets of leave.' By the stat. 6 & 7 Vict. c. 7, the legislature, thinking it just that tickets-of-leave convicts should be protected in their persons, and in the possession of such property as they might acquire by their industry, empowered them to hold personal property, and to maintain actions in respect thereof while such tickets remained unrevoked.

The reception of convicts having, however, become dis-astmetastate the inhabitants of the colonies, the stat. 10 & 11 Vict. c. 67, was passed, permitting offenders under sentence of transportation to be removed to any prison or penitentiary in Great Britain; directors of the principal convict prisons being appointed afterwards under the stat. 13 & 14 Vict. c. 39. The difficulty attending the reception by the colonies of transported convicts having increased, the stat. 16 & 17 Vict. c. 99, finally abolished the punishment of transportation for less than fourteen years, and substituted other punishments in its stead. The statute of 1749, c. 28, s. 5, directed in all cases to substitute such penal servitude for transportation.

Before this last statute was passed, a system had for some time existed, by which in certain cases and on certain objections (when, although sentenced to transportation, had been kept at home), of granting them free pardons, generally at the expiration of half their sentence of transportation. As the continuance of the same system under the last-mentioned statute seemed only to cause serious evils, and it was at the same time desirable to encourage good behaviour in convicts, it was determined to try the experiment of retaining some control over them in cases where they were set at liberty before their expiration. The *Car. III.* c. 5, 5, & 6, made an act setting forth the statute empowers the Crown, by order of one of the secretaries of state, to grant any convict a licence or 'ticket of leave,' to be at large during such portion of his term of transportation or imprisonment, and upon such conditions, as may be thought fit, such licence being also revocable at pleasure.

Finally by the *Stat. 20 & 21 Vict. c. 3, the sentence of transportation is entirely abolished, and the sentence of penal servitude substituted; but the statutes which have reference to transportation, have no reference to penal servitude, s: that the name alone is changed.

**Sexual System, in Botany,** is the name given to the method by which Linnaeus arranged the Vegetable Kingdom. It was introduced at the close of the 18th century, and is represented by twenty-four classes, each of which is distinguished by the name and relative position of the stamens. The following are the classes:
I. Flowers with Staminodia and Pistils.

Class 1. Monandria; flowers with 1 stamen.

2. Diandra........ 2 stamens.

3. Triandra........ 3

4. Tetraandra........ 4

5. Pentaandra........ 5

6. Hexandra........ 6

7. Heptandra........ 7

8. Octandra........ 8

9. Enandra........ 9

10. Decandra........ 10

11. Dodecandra........ 12-19

12. Icosandra........ 20 or more stamens inserted into the calyx.

13. Polyandra........ 20 or more stamens inserted on the receptacle.

15. Tetradynamis........ 6 stamens; 4 long and 2 short. [Ceratopogon.]

16. Monadelphia; flowers with the filaments of the stamens united in one set.

17. Diadelphia; flowers with the filaments of the stamens united in 3 sets. (In this class the flowers are papilionaceous.)

18. POLYADELPHIA; flowers with the filaments of the stamens united in 3 or more sets.

19. Syngynedia; flowers with the authors of the stamens united [Collourae].

20. Gynandra; flowers with the stamens and pistils combined. [OCHIDACEES.]

11. The Stamens and Pistils on different Flowers.

21. Monoezia; flowers with the stamens and pistils on the same individual.

22. Dioecia; flowers with the stamens and pistils on different individuals.

23. Polynamia; flowers perfect and unisexual, on the same or on different individuals.

III. Fructification concealed.

24. Cryptogamia.

It will at once be seen that this system is exceedingly artificial, and that the great object of arrangement and classification in natural history is not attained by it. The effort of the naturalist in all systems should be to bring together those objects which most resemble each other, and to separate those which differ. A classification like the above, which takes only one organ or part of an organised being as a means of arrangement, is, therefore certain to frustrate the great aim of the systematist, which is to establish a ground on which artificial classification such as the above can be tolerated is that of convenience in finding out the name of any particular object. It was undoubtedly this that led to the general adoption of the sexual system of Linnaeus by botanists from however fast falling into disuse; and our catalogues of plants and annuals of indigenous Floras are written on the plan of the Natural System. Linnaeus divided the above classes into orders in the same artificial way. The orders in the first thirteen classes were founded on the number of styles or stigmas in each flower. Thus, flowers having one style were placed in the order Monogyne, those with two in the order Digynia, with three in Trigynia, and so on. Thus the names of the orders are repeated in each of the thirteen classes, however other points of structure are adopted. In Didynamis the orders are two, according as the fruit is 4-lobed or capular. The first order is called Gymnosperma, and the second Angiosperma. These names were given by Linnaeus under the erroneous supposition that the 4-lobed ovary was a series of naked seeds.

The class Tetradymanis was divided into two orders, according to the form of the fruit, Siliaceas embracing the species with the fruit a siliceous, and Siliaceas those with a silique.

In the classes Monadelphia, Dioadelphia, and Polyadelphia, the number of the stamens was made the text of the orders, and these were named as the classes. Thus we have the order Decandria, class Monadelphia, and the order Decandria, class Dioadelphia.

With regard to Syngynedia the following plan will afford the best idea of the nature of the orders:

Order 1. Polynamia Equina. — Florets all hermaphrodites.

Order 2. Polygamia Superfusia. — Florets of the disc hermaphrodite, those of the ray pistilliferous and fertile.

Order 3. Polygamia Frutetana. — Florets of the disc hermaphrodite, those of the ray staminiferous.

Order 4. Polygamia Nectarosa. — Florets of the disc staminiferous, those of the ray pistilliferous.

Order 5. Polygamia Spergretiya. — Each floret having a separate involucr.

This large class thus divided by Linnaeus forms the natural order Composita, and has been recently subdivided in a much less artificial manner than in the orders above given. [Cornered.]

The class Gynandra was divided into orders by the number of the stamens. It includes the natural orders Orchidaceae and Aristolochiacæ.

The classes Monoezia and Dioecia are also formed into orders according to the number of stamens, and the orders are again named as preceding classes. Thus we have order

Dioecia, class Dioecia, etc.

The class Polygala has the following orders:—

Order 1. Monoezia. — Hermaphrodite, staminiferous, and pistilliferous flowers on the same plant.

Order 2. Dichogama. — Flowers on two plants.

Order 3. Tricyma. — Flowers on three plants.

The Cryptogamia were divided into the orders:

Filices

Musci

 Hepaticæ

Lichenes

Algae

Pungi

For the arrangement of the vegetable kingdom, according to which the Natural System, see the articles Exoes and Exoecæ.

SESSION 19. The statute 13 & 14 Vict. c. 45, has amended the procedure in Courts of Quarter Sessions, by prescribing uniformity of time for giving notices of appeal; by conferring extensive powers of amendment; a large discretion as to costs; and by enabling them to refer matters to arbitration. By the statute 11 & 13 Vict. c. 78, these Courts, in common with the Courts of Oyer and Terminer and Gaol Delivery, are empowered to reserve questions of law for the consideration of the Court of Criminal Appeal; and by the statute 13 & 13 Vict. c. 45, the powers previously given to Judges in order payments by way of reward for the apprehension of certain offenders was extended to these Courts, the compensation to one person in no case to exceed 51. The statute 12 & 13 Vict. c. 10, makes further provision for the holding of petty sessions at new towns and places. By the statute 11 & 13 Vict. c. 43, and 14 & 16 Vict. c. 55. See further JUVENILE OFFENDERS, S. 2; JUSTICE OF THE PEACE, S. 2.

SEYBERITE. [MINERALOGY, S. 1.] SHAKHOVSKY, PRINCE ALEXANDER ALEXANDROVICH, a prolific and popular Russian dramatic author, was born in 1777, at a village in the government of Smolensk. He entered the army in 1793, but in 1801 obtained the more congenial appointment of one of the directors of the theatre. The war of 1812 threw his life and fortune into the command of a regiment of Cossacks, but after its conclusion he resumed the duties of management. He retired with a pension in 1818, and died in 1846. During his lifetime Prince Shakhover was the most conspicuous of Russian dramatic authors, and was sometimes spoken of as the "Aristophanes of Russia." The number of his plays is loosely said to have approached a hundred; many of them were translations and adaptations chiefly from the French. Among them may be found a refashio of Shakepeare's "Love's Labour's Lost," and a recension of "A Lesson to Coquettes," are also of unusual merit. His vaudevilles and light comedies are considered his most successful efforts.

SHAP. [WESTMORELAND.]
SHARPE, DANIEL, F.R.S., at the time of his decease possessed of the degree of Honorary Fellow of the Geological Society of London, was born in London in 1806. His mother died a few weeks after his birth, was sister to Samuel Rogers the poet. He was educated at Walthamstow, and as a boy early showed a taste for the study of natural history, but he did not commence serious work at it till he had been admitted a Fellow of the Geological Society in June, 1829. In that year he gave his first memoir to the society, on the new species of Ichthyosaurus, I. grandipes, which, however, it afterwards appeared had been previously described by Cuvier, under the same name. Throughout the greater part of his life, Mr. Sharpe was actively engaged as a merchant, and his business connection with the wine-growing districts of Portugal occasionally led him to Lisbon and Oporto. In 1839, he went to the Geological Society a series of memoirs on the rocks of the neighbourhood of Lisbon and Oporto. The first is a mere sketch of the general arrangement of the tertiary and secondary rocks by a young and intelligent geologist; the second, on the same subject, is fuller and more definite, but not sufficiently complete in the determination of fossils to fix the precise age of the strata described. It contains, however, in an appendix, some observations of great value on the question of the relative position of the great coal strata on which Lisbon stands. The destructive effects of this shock were chiefly confined to the area occupied by the soft tertiary beds, while the buildings erected on the more solid Hippurite limestone and chalk escaped entirely. The same remark applies to the majority of the buildings Mr. Sharpe found to correspond precisely with the boundaries of the strata. In his third memoir Mr. Sharpe describes the granitic, gneissic, clay-slates, and coal-bearing rocks of Vallego near Oporto. The author, suspecting the porosity of its fossils to be of Lower Silurian age, and his sections show that the strata bearing anthracite coal underlie the slate, and rest on gneiss pierced by granite. He then concluded that the coal is of Lower Silurian age. In the obituary notice of Mr. Sharpe given in the 'Quarterly Journal' of the Royal Society for 1856, on which the present article is founded, but with omissions, alterations, and additions, the following just remarks occur on this subject:—"In the present state of knowledge regarding that country, it is impossible to deny that this may be the case, but it must be remembered that the few remains of plants discovered in these strata are considered by paleontologists to present characters indicative of 'carboniferous' age, and even those geologists who most strenuously support the so-called uniformitarian doctrine, incline to attribute the peculiar position of the coal to one of those great inversions of the strata so frequently in highly disturbed districts of all ages, from paleozoic up to tertiary time." The fourth paper commences with a succinct sketch of the general geology of Portugal, and goes on to define the limits of the secondary rocks north of the Tagus, both by stratigraphical and paleontological evidence. Long before the Portuguese geologist had been enabled to form a satisfactory idea of the skill and knowledge as a paleontologist, and on paleontological principles he now established the existence of cretaceous and Jurassic rocks in the country described. The whole formed an excellent sketch of a hitherto undescribed country, and up to this date British geologists are chiefly indebted for these memoirs for the knowledge they possess of a land where the science is almost uncultivated.

Between the years 1842 and 1844 Mr. Sharpe gave fourteen papers to the Geological Society of London, on Silurian and Old Red-sandstone rocks of Wales and the north of England, territories previously chiefly illustrated by the labours of Professor Sedgwick. The first of these is 'On the Geology of the South of Cumberland.' Part of this paper describes the range of the Carboniferous limestone. Mr. Sharpe identified it by its fossils as forming part of the Lower Silurian series, but did not determine its actual horizon. In 1839 Mr. James Garth Marshall, F.G.S., in a paper read to the Geological Society of London on the Old Red-sandstone rocks of the Sandstone Hills, inferred that the tilestones of South Wales should be withdrawn from the base of the Old Red-sandstone and classified with the Ludlow rocks, to which their fossils unite them. At a later period of the same year he produced a memoir titled 'On the Calcareous Limestone of the South of North Wales.' Up to this date it was believed that at Bala and elsewhere there was a great thickness of fossiliferous Upper Cambrian rocks of Sedgwick below the Lower Silurian strata. Mr. Sharpe maintained that these beds, which had hitherto been regarded as pre-Cambrian on account of the occurrence of fossils by their fossils, the Bala rocks were the equivalents of the Llandeilo flags and Caradoc sandstone. This magnificient determination has since been confirmed by Mr. J. W. Salter, F.G.S., as regards the Caradoc sandstone, the fossils of Bala being, it is now believed, the hinge of the South Shropshire opinions of Sir Roderick Murchison in Shropshire being the same.

The more elaborate paper of 1844 is accompanied by a geological map of North Wales, and has been considered the most important of the papers given in that year. The geological determination of the age of rocks, and, in this case at least, the time he allowed himself to map North Wales was too short for the satisfactory elucidation of the problems he proposed to solve. Puruing at intervals these subjects, Mr. Sharpe produced in 1847 an elaborate analysis and comparison of the Silurian fossils of North America, collected by Sir Charles Lyell, with those of Great Britain, and confirmed the views previously formed by Sir Humphry Davy and Sir Roderick Murchison, that the great American Silurian strata, like the British, consist of two great divisions, namely, upper and lower. While engaged in these investigations, Mr. Sharpe's attention was drawn to the subject of the slaty cleavage and crystalline schistosity of the Old Red Sandstone rocks of North Wales, the North of England, the Highlands of Scotland, and Mont Blanc. In 1848, 1849, 1852, and 1864, he produced four memoirs on these subjects, the two first and the last of which were written in the 'Quarterly Journal' of the Geological Society, and the third in the 'Philosophical Transactions' of the Royal Society. These questions had been made the subject of special investigation by Professor Sedgwick, Mr. Darwin, and Professor Phillips.

It is on the subject of the slaty cleavage that Mr. Sharpe generalized too largely; and though this may be the case, the most interesting and instructive part of the memoirs of 1846 proves that in some important points he materially advanced the subject at that date in the direction to which the labours of Mr. H. C. Sorby, F.G.S., have since tended. He attributes the cleavage of rocks, and consequent distortion of fossils, to pressure perpendicular to the planes of cleavage, and asserts that rocks are expanded along the cleavage planes in the direction of the dip of the cleavage. In the communication of 1846, the doctrine that pressure is the cause of cleavage is still more distinctly insisted on, and remarkable instances are given, in which pebbles were observed which appeared to have been sheared and elongated in the planes of cleavage. He also recognizes the fact that, as to cleavage, as truly and fully explained by Mr. Sorby, in the 'New Edinburgh Philosophical Journal,' that the fine particles composing the slaty rocks are arranged lengthwise in the direction of the cleavage, so that a cleaved and tissed rock from one bed to another, to beds of different lithological character offering different degrees of resistance to pressure. The idea that cleavage may be due to crystalline action he altogether repudiates. It must be admitted, however, that the investigations of Mr. H. C. Sorby have been most valuable and instructive in the study of the relations of crystallisation to the greater structures of rocks. We are at present uninformed whether there are or are not jointed structures on the great scale, resulting from the coincidence of a number of rocks. It is manifestly true that the phenomena exhibited by the sub-carboniferous limestones and by certain serpentines, tend to indicate. The two last of the series of Mr. Sharpe's papers on these subjects, published in 1853 and 1854, describe respectively the slaty and cleaved and tissed rocks of the sandstones of Scotland, and are chiefly devoted to the development of his theory of the great 'cylinders' or arches, in which he asserted that the lenses of cleaved and foliated rocks lie. In these memoirs he made a most valuable contribution to the science of geology, in explaining the phenomena of cleavage and foliation to the same scale and under the same conditions as in the fine rocks of the British Islands. The author of the paper also, though he indicated the fact, he gave no explanation of the reason of the occurrence of planes of cleavage and foliation in arched lines, a subject that has since been scatcely considered, but which has ceased to be matter of surmise, and which seems not far distant. In the paper on Mont Blanc however Mr. Sharpe explains and corrects for the first time, we believe, the remarkable error of Saurousse, in representing the
clysage of slates, wherever they occur in the Alps, almost invariably as stratification; having mistaken the planes of clysage for those of bedding, and regarded the latter as a series of parallel joints. But while showing that this systematic error was made, and the manner in which it was afterwards corrected, he also shows also that Sausse's observations, even when his conclusions are erroneous, are always accurate and instructive. He was led into the error from observing the analogy between the foliation of the schists and the clysage of the slate, and the foliation which is observed in the same volumes, he shows also that Sausse's observations, even when his conclusions are erroneous, are always accurate and instructive.

Anxious however to acquire a wider reputation, he, in 1786, came to London. Here he found in Edmund Burke a kind friend and adviser. Burke introduced him to Sir Joshua Reynolds, who treated him with much cordiality. Mr. Shee being entered as a painter, went at once to Rome, and returned to Brux half a century later. This change of residence was attended with an improvement in his professional standing. He had a good many portraits of the leading actors, and of the other noted politicians of the day, in the collection of the Academy. He was also engaged in the portrait painting of the Punic Wars, which Bonaparte had collected in the Louvre; and besides that, his biographer finds little to notice until he appeared before the public in the character of a poet, by the publication, in 1808, of his 'Rhymes on Art, or the Reminiscences of a Painter,' a work which his author described as 'a poem on painting, in which, more particularly, the early progress of the student is attempted to be illustrated and encouraged.' A second part of it appeared in 1809. Byron praised the poem, and it was a good deal read and quoted at the time; and painters still occasionally garnish their literary essays with a stanza or two from it; but its vitality has long since departed, though it has an easy flow of rhyme, and is not without more substantial merits, and the notes are occasionally valuable. Again—on churchmen and the like subject of the 'Roman and Gothic Monuments being exhibited at the British Institution, and a 'Commemoration dinner' in honour of Sir Joshua being given by the directors of the institution in May 1833, at Will's Rooms, the prince regent presiding—Mr. Shee invoked the muse, and the result was a poem, entitled 'The Commemoration of Sir Joshua Reynolds, and other Poems.' His next appearance as an author was under, to himself, more exciting circumstances. He had written a tragedy called 'Alas,' the principal character of which he seemed to be particularly suited to the historic poems of his friend Kebble; who agreed to act it. But it happened to be the first tragedy which fell under the hands of Colman, the new licenciate of plays, and he regarding himself as the abettor of all licence of thought and utterance, refused to admit into the play, and the play was put on at the Lyceum, with a certain amount of declamation about liberty, and denunciations of despotism, as well as one or two explorable actions of these the author as resolutely refused to submit, and appealed to the Lord Chamberlain himself against the decision of his deputy. But the chamberlain (the Duke of Montrose) declines to examine that on which his deputy had 'reported,' and, instead, he concludes, with the following note: 'I do not conclude, that at this time, without considerable omissions, the tragedy should not be acted.' Shee however was not about to be silenced, and resolved to shame his censors by printing his tragedy, though it was not allowed to be performed in public. It was printed in secret, and the play is supposed to have been performed in a place in which the facts were set forth with considerable warmth, while all the prohibited passages were printed in italics. The tragedy itself is forgotten now, but it was referred to by writers of literary and political history in situations suitable to the

...
of what was prohibited as politically dangerous in London so late as 1834. The censor certainly did his work carefully. Tresson is seen to lurk sometimes in single words—often in single lines, such as—

"Or question the high privileges of oppression."

Even the mention of—

"Some abundant tool of state, some stab, his blust, unsanctioned,"

is thought to bode mischief, and is expanded accordingly. This was Shee's latest appearance as a poet, but once later he tried his hand as a novelist.

Literature however was but his amusement. During all these years he had been steadily making his way to a fore-mentioned fashion as a portrait painter. By 1833, he was already recognized as an artist of the first rank. The mantle of Reynolds had not fallen on his successor, but Lawrence's easy gracefulfulness of style concealed his deficiencies from the eyes of his contemporaries, and he reigned in undisputed supremacy. But Lawrence could not alone satisfy the demands of the titled and wealthy claimants for the immortality of portraiture; and though among the political and literary celebrities Phillips perhaps was most in repute, his gay colour and polished manners undoubtedly rendered Shee second favourite with lords and ladies. On the death of Lawrence in 1830, he naturally aspired therefore to succeed him not only as a fashionable portrait painter, but also as president of the Royal Academy. Wilkie became his opponent, but though of course there could be no comparison between the one in whose power of the two men, the academicians felt that Shee's fluency of speech and courtly address were of far more consequence in the academic chair than more eminent artistic abilities with reserved manners and falling hairs. Shee was not by any means a large majority, and soon afterwards received the honour of knighthood. He is said to have filled all the duties of his office with zeal and ability, and his official eloquence on those public occasions which it called forth was much admired. He continued to paint until 1844, in which year he exhibited for the last time five pictures; but his powers had been for some years evidently failing. He now, on the ground of inability to discharge its duties, resigned the presidency, but at the unanimous request of the academicians he has induced to withdraw his resignation, and he continued to hold the office till his death, which occurred on the 13th of August 1850, in his eightieth year.

Sir Martin Archer Shee will not rank among the great portrait painters of the English school. He is deficient in depth and force, in intellectual expression and in characteristic. But his colour is often pleasing though too florid, and his figures have an air of ease and refinement; and his portraiture preserved the portraits of many of the more eminent of his contemporaries. He occasionally painted historical figures and fancy subjects, but none of them won much attention. He was an accomplished gentleman rather than a great painter.

Mr. Shee was a member of both the commissions (1838 and 1843) for the restoration of the standards of measure and weight, destroyed by fire in 1834. The standard of measure in the hands of Mr. Shee was a Professor of the Royal Astronomical Society of Great Britain (Francis, S. L.), at whose death Mr. Shee was from 1838 to 1844) to continue the restoration. This matter occupied him closely during the last eleven years of his life. It would not be possible to give any detailed account of the operation, a full history of which is expected from Mr. Airy. It need only be said, that after a thorough examination of the process, beginning with the very construction of thermometers, — a point which gave no small trouble — he concluded that the scale on the model of the inch was perfectly just. He deposited the bill (18 & 19 Vict. cap. lxxiv.) which received the royal assent on the 30th of July, 1855, the day following that on which Mr. Shee was struck by the shock which ended his life. The number of recorded micrometer observations is just five hundred short of a thousand. He had given a succinct but very satisfactory account of the operations for the production and verification of the new standard, in the Report of the Commissioners, for March 28, 1854, which was not long after his death had become public.

It has been recorded on adequate authority that Mr. Shee was especially distinguished by the integrity of his mind, and by his utter renunciation of self in all his pursuits. He did not court fame, it was enough for him that there was no dishonour in the work he did, should his whole life be useful to his country. His leisure, and his desire to help the young astronomer so long as he wanted advice and guidance, gave a peculiar value to his services, and a peculiar utility to his career.

contented in defence of truth and justice, as they appeared to his mind.

SHELBURNEX. (Nova Scotia.)

SHELBURNE. (Nova Scotia.)

Sheil, Richard Lalor, the son of Mr. Edward Sheil, a merchant of Cadiz, was born in Dublin in the year 1793. His father was a Roman Catholic, and he was educated at that religion at the Jesuit College in Dublin. Sheil's father's means through a dissaisnace partnership caused a change in his destination, and he returned to Ireland, where he was called to the bar in 1814. He defrayed the expenses of his years of study by the successful tragedy of 'Adelaide' in which Miss O'Neill performed, and by those of the 'Apos-
tate,' 'Bella'mira,' 'Evdane,' and 'The Huguenot.' About the same time he also contributed some 'Sketches of the Irish Bar' to the 'New Monthly Magazine,' then edited by Mr. T. Campbell, and published in London. Sheil gained credit as a writer and a speaker, he never hastily devoted himself to a deep study of so dry a subject as the law, and that his professional income in consequence was not large. He was not a lawyer but an orator by nature, and he found his greatest success on the platform for the display of his talents than the law courts of Dublin. As a Roman Catholic too he laboured under the civil disabilities which, though modified from what they had been, still abut the doors of the learned profession. It was his fate to form a religious organization. It is not surprising therefore that he turned his attention to political and religious agitation. In 1822 he became an active member of the Catholic Association; and three years later was chosen in conjunction with the late Mr. Daniel O'Connell to plead in the House of Lords against the bill introduced for its suppression. The bill however passed; but it only served to inflame his religious zeal and to rouse his oratorical powers to such a pitch of vehemence invective against the act, and the act itself, that his voice was heard against him for seditious language. The illness of Lord Liverpool however transferred the premiership to the hands of Mr. Canning, who wisely ordered the prosecution to be abandoned. In 1829 Mr. Sheil took an active part in procuring the return of Mr. O'Connell to parliament as member for the county of Clare, and also addressed the great meeting held at Penenden Heath for the purpose of resisting the Roman Catholic Emancipation Bill. In 1830, soon after the passing of the Repeal Bill, he introduced the resolutions expressing the sincere sympathies of Milborne Port, by the influence of the late Marquis of Anglesea, who, while holding the lord lieutenantcy of Ireland, had noticed his career, and who thus turned the restless agitator and politician into one of the most popular and attractive speakers in the House of Commons, though the matter of his speeches never rose to a level with the brilliancy of illustration and flow of impassioned declamation with which they were adorned. In 1830 he was again returned for Milborne Port, and in 1831 for the county of Louth. After the passing of the Reform Act, which gave much dissatisfaction in Ireland, Mr. O'Connell continued agitating for repeal, in which Mr. Sheil at first refused to join, but subsequently consented, considering, as his biographer, Mr. T. McCullagh asserts, that it "was in point of fact but short-hand for just and equal government in Ireland." In December 1832 for the first reformed parliament he was chosen to represent the county of Tipperary, where he had acquired some extensive landed influence by his second marriage with the widow of Mr. E. Power of Gurteen, on which occasion he adopted that lady's maiden name, the Sheil. This was the Irish Coercion Bill, which was strongly opposed by most of the Irish members, among whom was Mr. Sheil, but a report became current that several of them had expressed a wish that it should be carried, "or there would be no living in Ireland," and on Lord Althorp being appealed to, he replied that he had no personal knowledge of any such expression, but had heard it, and though he could not give up the names, he would tell any member who asked whether he was one. On

Mr. Sheil making the inquiry, he replied he was one who had been mentioned. Mr. Sheil denied it at once: a parliamentary committee was appointed, and Mr. E. Hill, who appeared before the committee to support the agitation, confessed that he believed that he had been misrepresented. In the following year Mr. Sheil published a pamphlet, entitled 'The Compact,' a term applied from a phrase of his own, in which he hoped "that no minor differences would mar their compact and cordial alliance." In 1839 he was offered office by Lord Melborne, the secretary of state for the colonies; at first the clerkship of the ordnance was spoken of, but ultimately he became one of the commissioners of Greenwich Hospital, and never again advocated repeal. In 1839 he was made vice-president of the Board of Trade; and was also sworn a member of the Senate of Ireland, the first Roman Catholic who was made a peer on whom that honour had been conferred since the reign of James II. In June 1841 he was appointed judge-advocate-general, when he resigned the seat for Tipperary for that of the borough of Dungarvan; but he held office only till the following September, when his party were superseded in office by the late Sir Robert Peel. On the advent of Lord John Russell to power in 1846, Mr. Sheil was appointed to the mastership of the Mint, which he filled until November 1849, when the party in office was dismissed. In 1856 Sheil resigned credit as a writer and a speaker, he never hastily devoted himself to a deep study of so dry a subject as the law, and that his professional income in consequence was not large. He was not a lawyer but an orator by nature, and he found his greatest success on the platform for the display of his talents than the law courts of Dublin. As a Roman Catholic too he laboured under the civil disabilities which, though modified from what they had been, still abut the doors of the learned profession. It was his fate to form a religious organization. It is not surprising therefore that he turned his attention to political and religious agitation. In 1822 he became an active member of the Catholic Association; and three years later was chosen in conjunction with the late Mr. Daniel O'Connell to plead in the House of Lords against the bill introduced for its suppression. The bill however passed; but it only served to inflame his religious zeal and to rouse his oratorical powers to such a pitch of vehemence invective against the act, and the act itself, that his voice was heard against him for seditious language. The illness of Lord Liverpool however transferred the premiership to the hands of Mr. Canning, who wisely ordered the prosecution to be abandoned. In 1829 Mr. Sheil took an active part in procuring the return of Mr. O'Connell to parliament as member for the county of Clare, and also addressed the great meeting held at Penenden Heath for the purpose of resisting the Roman Catholic Emancipation Bill. In 1830, soon after the passing of the Repeal Bill, he introduced the resolutions expressing the sincere sympathies of Milborne Port, by the influence of the late Marquis of Anglesea, who, while holding the lord lieutenantcy of Ireland, had noticed his career, and who thus turned the restless agitator and politician into one of the most popular and attractive speakers in the House of Commons, though the matter of his speeches never rose to a level with the brilliancy of illustration and flow of impassioned declamation with which they were adorned. In 1830 he was again returned for Milborne Port, and in 1831 for the county of Louth. After the passing of the Reform Act, which gave much dissatisfaction in Ireland, Mr. O'Connell continued agitating for repeal, in which Mr. Sheil at first refused to join, but subsequently consented, considering, as his biographer, Mr. T. McCullagh asserts, that it "was in point of fact but short-hand for just and equal government in Ireland." In December 1832 for the first reformed parliament he was chosen to represent the county of Tipperary, where he had acquired some extensive landed influence by his second marriage with the widow of Mr. E. Power of Gurteen, on which occasion he adopted that lady's maiden name, the Sheil. This was the Irish Coercion Bill, which was strongly opposed by most of the Irish members, among whom was Mr. Sheil, but a report became current that several of them had expressed a wish that it should be carried, "or there would be no living in Ireland," and on Lord Althorp being appealed to, he replied that he had no personal knowledge of any such expression, but had heard it, and though he could not give up the names, he would tell any member who asked whether he was one. On
visions of the repealed statutes being, in principle, though not always in detail, re-enacted by the statutes about to be mentioned.

The most important of these is the Merchant Shipping Act 1858, which is amended by stat. 18 & 19 Vict. c. 91; the next in importance, the Passengers' Act, 18 & 19 Vict. c. 110. The Act relating to bills of lading, and that conferring admiralty jurisdiction on the County Courts, have been repealed by stat. 18 & 19 Vict. c. 110. [See County Courts, § 1.] It would be quite impossible in this place to give any detail of the provisions of these Acts, which constitute complete codes in themselves, and which must be referred to by every one who wishes to know anything of the subject.

It is necessary to mention here, however, the statutes which have repealed the Navigation Acts, whereby it was said, "the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidable necessarily.

These Acts were by various statutes maintained down to a recent period; their leading feature being to secure the exclusive trading by which it was thought British shipping and navigation were encouraged. The first step in favour of free trade was effected by the statute 12 & 13 Vict. c. 29, by which the exclusive privileges of British ships were limited in effect to the coasting trade of the United Kingdom, the trade with the Isle of Man and Channel Islands, and the coasting trade of the colonies. But that Act has been almost entirely superseded by the Merchant Shipping Act of 1858, by which the entire trade has been thrown open to vessels of all nations.

The Board of Trade exercises a general superintendence over all matters relating to merchant ships and seamen, and the carrying into execution of the statutes in force relating to these. For this purpose it appoints inspectors and master-mates, and appoints officers to report to the Board on the condition and efficiency of shipping and their machinery. These and all their duties, and the mode in which they are exercised, are defined in the Merchant Shipping Act, and other statutes above referred to.

SHIPSTON ON STOUR. [WORCESTERSHIRE.] SHIPLYRICKS AND LIFE-BOATS. That wrecks are numerous, is a fact well-known to a seafaring nation like ours. The Risk of marine insurance, apparently having regard being had to the perils of the deep, will of course be admitted; but that nothing can be done to lessen their frequency, would be a hopeless theory of which we ought to be forewarned. A new mode of fixing the idea that some wrecks are occasioned by the want of scientific knowledge of winds, waves, currents, whirlpools, shoals, reefs, and sunken rocks, on the part of meteorologists and hydrographers; that others are caused by the incompetency of captains and mates; and that others again result from the insubordination, carelessness, ignorance, or obstinate fatality of seamen; that a fourth group are due to the deficiency of light-houses, beacons, and breakwaters; and that the remainder are rather the result of wanton disregard than of any received to know that on the whole it was favourable, a fewer lives were lost and more were saved, than usual; yet still our coasts saw no fewer than 1143 wrecks of ships. The lives lost numbered 352 (in 1864 they amounted to 1650), and the vessels lost numbered 668, of which 209 were by life-boats, 512 by loggers, coast-guard boats, &c., 507 by assistance from shore with ropes, mortars-apparatus, &c., 243 by ships' own boats, and steam-vessels, and 5 by individual exertion of a life Saving Society member, happened on our coasts—on the coasts of the most busy maritime islands in the world; where, if there be liability of disaster through the vast congregation of shipping, there ought, on the other hand, to be a supply of means, which, to a good sense sufficient to check, to some degree, such disasters. In examining the details of the chart, it will be seen that, as usual, the line of coast between Dungeness and the Pentland Frith is the most fatal, and that the whole of the Tyne makes the unequalled precedence of all other places, in the number of black dots and stars opposite to its name; next come the mouth of the Tees and the mouth of the Wear. These three rivers may be taken as the representatives of the district whence three million tons of coal are brought by sea to London yearly, employing the services of several thousand collier ships, which sail to and fro, and add to the otherwise busy commercial trade of the Northumberland and Durham ports. The mouth of the Humber, the Suffolk coast between Yarmouth and Southwold, Goodwin Sands, the Scilly Islands, Barnstable Bay, and Liverpool, are the portions of the English coast which present, in the next degree, the most numerous indications of wrecks; the Channel coast of Glamorgan, Pembroke, and Anglesea, Scotland, except in and near the Frith of Forth, presents no large numbers; the western coast is, indeed, remarkably free, due probably to the less exposure to the winds which tend to drive ships more on our eastern seacoast; the total wrecks 313 were by collision, owing, in many cases, as the report states, to "bad look-out," "neglect to show light," "neglect of the rule of the road," &c.; and cases of collision continue to increase. One prominent cause of collision is stated to be the difference of knowledge existing between the masters and the men, standing by the showing of a single light, and a coloured one at the bow is recommended. The total estimated losses occasioned by these wrecks was 519,001l., and the amount recoverable by the insurance companies was 398,100l. The Board, in consequence, institute inquiries into the causes of the wreck in many cases, and, during the year the certificates of several of the captains and mates of the wrecked vessels were cancelled or suspended for drunkenness, carelessness, and incapacity.

Many inquiries into the causes of shipwreck have been instituted; and especially one by a Committee of the House of Commons, whence a voluminous report resulted. But public attention was perhaps more fully drawn to the subject by the Dean of Westminster, who, in 1860, offered a premium for the best method of being a safe pilot. By the method of fixing the idea that some wrecks are occasioned by the want of scientific knowledge of winds, waves, currents, whirlpools, shoals, reefs, and sunken rocks, on the part of meteorologists and hydrographers; that others are caused by the incompetency of captains and mates; and that others again result from the insubordination, carelessness, ignorance, or obstinate fatality of seamen; that a fourth group are due to the deficiency of light-houses, beacons, and breakwaters; and that the remainder are rather the result of wanton disregard than of any
ports for a similar purpose; to maintain a correspondence, beneficial to all parties, with these Local Committees; to reward persons who render assistance to distressed ships or mariners; and to encourage the invention of new or improved boats, buoys, belts, rocket apparatus, and other means for the security of the life-boat service. The Society commenced a little work, in Numbers at twopence each, which, at intervals, gives an epitome of all that is worth knowing on this matter.

A deed was given by a Quarterly Reviewer to the Duke of Northumberland, in that he has established, at his own cost, at the principal stations on the coast of his native county, "life-boats of an improved construction, and supplied with all the necessary apparatus and appliances, for preserving human life in and on the sea," much to the satisfaction of the Society, inasmuch as it is on the smiling coast, favourably stimulating the humanity and activity of the neighbouring peasantry, and from which the tourist, without being unreasonably sentimental, may derive his share of satisfaction. The grave-yards which surround the striking ruins and picturesque churches of "mountains Northumberland," are full of the mournful records of youth cut off in its bloom, and manhood in its prime, by the tempestuous waves. Each stone has its own tale—of brothers found lost in the same boat, or of fathers perished in a vain attempt to save his sons—of whole families, united in industry and affection, and unvindicated in death, swallowed up in the little craft that constituted the whole of their worldly wealth. He must be 'duller than Lethe's dull weed' whose heart fails to feel the struggles and their fate, and whose eye does not glint when he hears of the misfortune which has done all that on that dangerous coast can do to avert such catastrophes in future. The Quarterly Reviewer, No. 154, is too modest, however, to say that all has been done that can be done; this is to put a limit to man's ingenuity and forethought, which we should be sorry to omit until the desired end has been more fully attained.

As an example—of the means for preventing shipwrecks, or for saving the lives of those who may be endangered by them—but for rendering aid to the poor fellows who may have lost all but life by such calamities, the "Shipwrecked Fishermen and Mariners' Royal Benevolent Society" deserves a word of notice. The scheme was formed at Bath in 1839 by Mr. Rye, who was impressed with the importance of affording relief to the widows and orphans of fishermen and mariners who might be drowned, and of assisting with clothes, food, and money, those who might be cast ashore from a wreck—alive, it is true, but deprived at once of all the necessities of life. Aided by Sir Jahleel Brenton, at that time Governor of Greenwich Hospital, Mr. Rye succeeded in establishing a society, and in collecting a respectable subscription. The Society continues to thrive; and in that same year, three fishing-boats were lost in Mount's Bay, involving the death of 20 persons, and the sudden impoverishing of 7 aged persons, 12 widows, and 35 children. A sum of money was collected, and the usefulness of the Society into notice. The Society progressed steadily. Between the years 1839 and 1864, it afforded relief to 30,000 shipwrecked persons, and to more than 14,000 widows, children, and dependants of fishermen and mariners who had been drowned. The aid is not wholly eulogous: it partakes in some degree of the character of a provident fund. Primarily, the Society "boards, lodges, and conveys to their homes all destitute shipwrecked persons to the amount of 30s. each in the defraying of the expenses of the agents of the Society;" but aid beyond this limit depends upon membership. All fishermen and mariners may become members by the payment of 2s. 6d. per annum. The Society affords temporary assistance to the widows, parents, and children of all such members as may have been drowned; and gives a gratuity to such members as, without losing life, lose or damage their apparel or boats by wreck or similar calamity. The longer the period during which a fisherman or mariner has been a member of the Society, the larger the gratuity allowed to his widow and children in the event of his death by wreck or drowning. Every institution which fosters habits of provident forethought is worthy of respect and support; and the Society, as an example to the public, has a high claim to public description. As to the purely charitable part of the plan, it ranks with a multitude of other praiseworthy modes of helping those who cannot help themselves.

It was found, however, in the course of years, that two societies—bearing the titles "Royal Shipwrecked Institution," and "Shipwrecked Fishermen and Mariners' Royal Benevolent Society,"—were liable to be confused in the public mind; and a union or amalgamation became desirable. Accordingly, in the early part of 1865, the latter-named body amalgamated with the former, which, among other things, held eight life-boat carriages; in order that one society might have the sole management of the life-boat department of those benevolent schemes; while the other might continue to attend to the wants of shipwrecked mariners, or their widows. The "National Shipwrecked Institution" at the same time changed its name to the "National Life-Boat Institution," to define more clearly the objects aimed at.

That there was a positive amount of good work rendered by the Life-Boat Institution is made manifest by the simple fact, that in 1867 alone the life-boats belonging to, or in connection with, the Institution, were those of saving the lives of 366 persons, of whom would probably have been lost but for such aid. The following is a list of the lives saved, for which rewards were given by the Society:

It may not be that these lives were all saved by the instrumentality of the Society; indeed such was not the case. In many instances the saving of life by the life-boats or other means did not involve any extraordinary target, or exercise of any remarkable skill or bravery, and it is only to such cases, whether performed by persons connected with the Society or strangers, that the rewards are distributed; and the list, therefore, only includes the cases of lives saved from shipwreck on our coast, in which the Society gave honorary or pecuniary rewards.

The life-boats belonging to, or in connection with, the Institution, in March, 1865, were no less than 70 in number, and there are 76 others provided from various sources, and not in connection with the Society. Considering that the boats usually cost from 100l. to 200l. each, the boat-carriages about an equal sum, and the boat-houses about 100l., it will be seen that the amount of money thus sunk is something over 70,000l. The three counties form the three counties most liberally provided. These boats, on an average, appear to be about 30 feet long by 8 feet broad, 3 or 4 feet deep, weight 40 cwt., and are rowed by 8, 10 or 12 oars.

The life-boats above adverted to, are purposely constructed as to brave the peculiar dangers of a coast where shipwrecks are liable. Seventy years ago the construction of such boats began to attract attention; and in 1789 Mr. Greathed, of South Shields, constructed what may be deemed the original of all the life-boats since made. Cork was largely used in Greathed's boat to render it more buoyant; and since his time air-tight cases, formed of india-rubber cloth, have been a favourite feature in many of the inventions.

When the first model of the Royal Institution's boat, the prize was given to Mr. Beechings, of Yardley, in consideration of the boat which seemed to combine the greatest number of good qualities. Since that time a boat, invented by Mr. Peake, of her Majesty's Dockyard at Woolwich, has been more frequently adopted as a model than any other.

A boat built of oak, of the kind mentioned, and where there are numerous fittings necessary to render it workable: there must be a boat-house, in which to keep it sheltered from the weather when out of use; and a carriage whereon to wheel the boat to the beach; and, in case of a vessel being stranded. Moreover, there must be a crew of trusty men, able and willing to brave a raging sea, strong and resolute to pull the oar under any stress of weather; and there must be a master or coxswain, exercising sufficient control to
command the men, and direct their energies in a proper channel. It is in this direction, quite as much as in the provision of life-boats and buoys, that the Life-boat Institution has rendered service. A system of service, partly in the nature of a salary, partly as a reward, is adopted, such as may induce steady men to render aid; and the local committees are so organized, that in many cases, there is no one else to be desired, and in laying down the rules which are to govern the movements of the life-boat corps.

The exact mode in which a life-boat renders its useful service must depend, of course, on many contingencies of wind, waves, shoals, reefs, rocks, &c. The following is an example:—On the 2nd of May, 1855, in early morning, the beachmen at Ramsgate heard alarms given, and saw signal-rockets fired on board the light-vessels moored off the Goodwin sands. The vessels were ordered to be sent out at once, to be stationed in that perilous region. The Ramsgate life-boat (the property of the Ramsgate Harbour Commissioners) was speedily manned and equipped, and taken in tow by the Samson steam-tug against a rough wind and tide. The helpless ship was seen from the steamer with signals of distress flying, and apparently high and dry on the further edge of the Goodwin; the tide being low at the time, and a heavy sea on the edge of the sand. At a particular point the life-boat left the steam-tug and advanced towards the stranded vessel, but it was speedily found that the depth of water around the vessel was too small to permit a close approach by the boat. The men, therefore, waited until the incoming tide favoured them a little; they went on; they ran on shore amid the woods of the master of the vessel, jumping overboard into the surf, waded to the ship, which they reached in an exhausted state. The ship was the Queen of the Teign, bound from Antwerp to Liverpool with a valuable cargo of sugar, hemp, and seeds. When the crew of the ship saw the exertions of those who had undertaken to aid them, they descended from their vessel into a boat, jumped on the lee-side of the sand, and thus got into the life-boat. As soon as the tide had risen sufficiently to allow the steamer to approach close to the ship, a small boat was sent over with a line, and a communication being thus established, she was enabled to lay out an anchor to leeward, and subsequently to get her own large tow-boat fast to the vessel. By means of these vessels was brought off from her dangerous position, and taken in a leaky state, with four feet water in her hold, into Ramsgate Harbour.

Another example is worth noticing, as showing the recklessness of crews, and the probability that such recklessness frequently occasions loss of ships. On October 7th, 1854, signals of distress were observed in the direction of the Holm Sand, off the Suffolk coast, during a strong easterly gale. The Pakefield life-boat immediately put off, towed by the Lowestoft steam-tug, which was steaming into leeward, the boat weathered the sand, and then observed the sea breaking heavily over the ship, a Norwegian brig, of 180 tons. With some difficulty the boatmen succeeded in getting on board, where they found a crew of eight men, all dressed in their oilskins, menaced by drowning, and without the possibility of seeing their vessel got off, obstinately refused to leave. The boatmen, finding persuasion to be useless, and knowing that the life-boat itself was in a perilous position on the verge of the shoal, with the waves constantly breaking over it, returned to Lowestoft Harbour. At daybreak on the next morning, another crew from Pakefield manned the life-boat, and succeeded in reaching the vessel, where the crew, sobred during the night, and saved their lives, and the ship was saved without the possibility of being drowned, and without the possibility of seeing their vessel got off, obstinately refused to leave. The boatmen, finding persuasion to be useless, and knowing that the life-boat itself was in a perilous position on the verge of the shoal, with the waves constantly breaking over it, returned to Lowestoft Harbour.

There is no part of our maritime system, in which, in recent years, attracted more attention than that which has just been illumed. The qualities of personal character and conduct of the men employed. Who can tell the amount of misery which one hour of inebriety, one display of incompetency, may produce? The ship may be all that human art can effect, in strength and efficiency; the fittings and stores may be all that could be desired, and yet the crew may be grossly ignorant in quantity—and yet one slight manifestation of indiscretion or of unskillfulness, may give room for a catastrophe which will plunge scores or hundreds of human beings into a watery grave.

This may be taken up by the Legislature many years ago; but it is now treated of in the system established in virtue of a statute presently to be noticed. The life-boats of which we have spoken, are not the only means necessary for affording aid to stranded or wrecked ships. There are times when other aid is needed; when a ship is in distress so near the shore as to be within reach of a rope, if means were at hand to throw it—while, perhaps, no boats are near the spot fitted to render the required service. The name of Captain Manby is familiar to all who have read of this subject. Captain Manby's ingenuity was excited by a terribly distressing scene which he witnessed in 1807; when the Snipe, a gun-boat, was lost off Yarmouth; when sixty-seven persons were drowned, and sixty-year-old woman, A lady was saved from five or six hours on the wreck, without a possibility of receiving assistance. Long before this, he had thought on the subject. He had, in 1753, thrown a line, by means of a small mortar, over Downham Church, in Norfolk, and it was pulled up with a man in it; and he had afterwards thrown a line over a stranded vessel. During many subsequent years he made repeated experiments; his main difficulty consisted in securing the shot to the rope; iron chains were liable to break on the discharge; but at length he found that stout strips of closely-plaited rawhide would answer the purpose. In 1792 the Society of Arts gave a premium of fifty guineas to Lieutenant Bell for a "plan for throwing a rope on shore by means of a shell from a mortar on board a vessel in distress;" this plan was in practice at Lowestoft. Captain Manby was the first to put in practice a really available plan.

Let us see what is the end to be attained, that we may understand the mode of attaining it. A ship is stranded near the shore, say two or three miles from the land. What are the crew to do? Sailors, unfortunately for themselves, are in too few cases swimmers; and even a swimmer has a poor chance for his life in such weather and such a sea as usually accompany these strandings of ships. Captain Manby's plan was to get a vessel as long as her timbers will hold together, rather than strike out and endeavour to swim to shore. In such case their safety mainly depends on the establishment of some communication with the shore. Such communication was the one the Snipe had. On February 19th, 1808, a brig ran aground within a hundred and fifty yards of the Yarmouth coast; the crew lashed themselves to the rigging, and bore up against a furious storm as best they might. In about four hours the man at the wheel hauled off a boat to them failed. At length Captain Manby brought his mortar down from his residence to the coast, and succeeded in throwing a line over the ship, by which all the poor fellows were saved. Having thus proved practical proof of what could be effected, Manby was instrumental in causing many mortars to be so applied on the coast. He frequently tried to obtain some recognition of his services from the Government; and in this matter he was more fortunate than many another which aimed at the same object. Whereby the attention of the Legislature was drawn to the subject of wrecks and life-saving apparatus; and when he died at a venerable age in 1854, he left behind him a name worthy of the gratitude of society.

It must be observed, however, that the benevolent efforts which have been made to save lives have been only made by means of the ropes thrown out to stranded ships, through the agency of mortar-rockets. There are 198 places on the shores of the United Kingdom, where such apparatus is kept, mostly under the charge of the Coast Guard, who, from the peculiar nature of their other duties, are well adapted for this kind of service.

The articles transmitted to the Paris Exhibition of 1855, by the Life-boat Institution, may be taken as a test of the degree of improvement which has been made in this branch of useful art. The first was a model life-boat and carriage, as now adopted by the Institution, and stationed on many parts of our coasts; the boat, invented by Mr. Peake, of Lowestoft, is 32 feet long, 4 feet 7 inches wide, and 32 feet deep; it is considered to possess, in a high degree, seven qualities required in a life-boat—terrific vortex, line of attack, and safety of those on board. The launching and beaching, quick self-discharge of water, the power of self-righting if upset, great strength, and storage-room for a number of passengers. Another specimen, was the life-boat which gained for Mr. Beeching, of Yarmouth, with the prize of 100 guineas, the model life-boat, invented by Mr. Peake, of Lowestoft, 32 feet long, and 3 feet 7 inches wide, and 2 feet 9 inches deep, designed by Mr. Peake, but not quite so deep. A third was Mr. Palmer's life-boat, employed for many years by the Society, and stationed at many points on the coast of France. A
fourth was Mr. Ward Jackson's life-boat, such as is stationed at the West Harlilpool Docks. Besides these boats there were several minor articles, such as trav-lin life-buoys, to be used with the rock-boat and mortar apparatus; corck life-boat and life-buoy; and a number of other things. We have now to notice the recent law concerning shipwrecks. The year 1854 gave strength to the cause, by bringing the power of the government to bear upon it—not that such strengthening is necessarily a result; for the "right and just assertion of a principle, by the government departments always do the right thing at the right time; but it seems especially fitting that the legislature, and through it the executive, should have a voice in the development of a maritime economy of a maritime nation. Mr. Cardwell brought forward his bill, the number and concerning the Board of Trade; the management and tolls of lighthouses; the constitution of the Mercantile Marine Fund; the laws relating to wrecks, casualties, and salvage; the liabilities of shipowners; the procedure in the event of misdemeanor; and miscellaneous maritime laws. The Board of Trade, being in charge of the wrecks and accidents, are to be appointed by the Board of Trade; new examinations for masters and mates are to be organized, separating formal to correspondence; the arrangements for the boats to accompany all trading ships are described; every ship carrying more than ten passengers must be provided with a life-boat, or an ordinary boat rendered buoyant, and with two life-buoys—these and all the life-saving appliances being always kept ready for use; lights and fog-signals are to be supplied, may be supplied by the Admiralty; iron steamers must have water-tight compartments, and safety-valves beyond the control of the engineer; sea-going ships must be provided with fire-engines and hose, signal-guns, and ammunition for firing signals of distress.

Besides the provision for preventing wreck, the Act contains many clauses, applying to cases in which wreck may happen to have occurred. As these arrangements are some-
what specimens of the general superintendence of the Board of Trade, by whom 'Receivers of Wreck' are to be appointed. These receivers will have their charge for the width and extent of the wreck, any wreck, or similar casualty, and power to issue such directions as may seem expedient for the preservation of life and property, or for the prevention of plunder and murder. Whenever a ship is stranded, or otherwise in distress on British shores, bystanders are to be encouraged to render assistance, by having a pecuniary interest in the preservation of life or property. If services so rendered shall be instrumental towards the object in view, the persons shall have a right to claim a certain substantial and reasonable amount of salvage. Numerous directions are given for ascertaining what would be a "reasonable amount" in each case; for enforcing the claim of the salvor against the dietrainor; for disposing of an unclaimed wreck; and for adding to the salvor's reward out of the Mercantile Marine Fund, in cases where life has been preserved, and where the wrecked ship is insufficient in value to pay the salvage awarded. The Mercantile Marine Fund here adverted to is made up in a curious way; it consists of certain fees re-
cected from the owners of life-boats, and also fees paid connected with merchant-ships; lighthouse dues accruing by virtue of certain sections of the Act; rates accruing from haggate and ballastage in the Thanes; and fees derived from the inspection of merchant-ships. All these derive from her Majesty's Paymaster-General, is employed in pay-
ment of the salaries of examiners, surveyors, receivers, &c.; expenses in regard to lighthouses, buoys, beacons, haggate, ballastage, life-boats, &c.; and rewards to persons who assist in saving wrecked ships, or crews, or passengers.

In pursuance of the powers conferred by the statute above sketched, the Board of Trade proc-ed, early in 1855, to give effect to its provisions. Among other steps, the Board addressed a Circular to the life-saving committees through the United Kingdom. Considering that in 1854 no fewer than 1540 persons perished from wrecks on our own coasts, it is not too much to say that a wide field is yet open to the "right and just assertion of a principle." In many of these cases many of those persons might have been rescued had there been life-boats and willing aiders at the places where the calamities occurred. The principle intended by the Act, and entrusted to the Board of Trade for realisation, is not to be restricted by sectionalism, but to be established as a law which will help themselves." A preparatory Circular was addressed to the several Life-boat Committees in September 1854, and this was followed by another in February 1855. The Circular dwelt strongly on the fact that the Board would insist on evidence of local activity before sanctioning grants out of the Mercantile Marine Fund. "In the wealthier and more populous portions of the kingdom, my Lords anticipate that the public spirit of the neighbourhood will super-
" The Circular dwelt strongly on the fact that the Board would insist on evidence of local activity before sanctioning grants out of the Mercantile Marine Fund. "In the wealthier and more populous portions of the kingdom, my Lords anticipate that the public spirit of the neighbourhood will super-
fittings ascertained; and if, from any cause, the greater part of her ordinary crew are absent, she had nevertheless better be taken afloat by any other of the seamen of the port who may be obtained, but always, if possible, in charge of the permanent coxswain of the boat. The salary of the coxswain is double that which has previously been paid by this institution. In return, it will be expected that they shall devote the more time and attention to preserving the boats and their appurtenances under their care in a constant state of efficiency, and ready for instant service. With regard to the hire of horses or steam-tugs, and the payment of persons to assist in launching and hauling up life-boats, the attention of the Local Committees will here be chiefly required to check undue charges and to avoid incurring such expenses, except when necessary. It is thought, also, that they may do much good by endeavouring at all times to encourage public spirit, and other disinterested motives, in those who are called upon to assist on such occasions, and, as far as possible, to bestow such services of a mercenary character.

Under this Act, in 1857, the Board of Trade paid a total sum of £2,000 for rewards, pensions, &c., and for maintaining the Rocket and Mortar Apparatus.

SHIRE. See County Courts, S. 2, p. 158. Hundred Courts and Courts Leet have long been almost entirely obsolete, and the County Court statutes accordingly contain provisions for the surrender of such courts by the lords thereof to the Crown. It does not appear, however, that any surrenders have yet been made.

semimetal; they are found near the surface, where the rock has undergone partial decomposition. The sulphates of lead, iron, and copper, of the mining region, generally contain silver, and are also worked. (Dana.)

The principal mines of silver in Europe are those of Spain, of Kongsberg in Norway, of Saxony, the Hartz, Austria, and Russia.

In England, argentiferous galena is worked for its silver. Forty thousand tons of this ore were reduced in 1837, while contained upon an average about six ounces of silver in a ton of lead.

The annual product of the several countries of Europe is thus estimated by Dana in his "Manual of Mineralogy": —

making in all 286,150 troym pounds, or about 4,600,000 dollars annually. With the sum from Russia, about 720,000 dollars, it becomes 5,330,000 dollars a year. This is small compared with the amount from America, which at the beginning of the present century equalled 2,100,000 pounds, or $314 millions of dollars, nearly six times the above sum; and it is probable that these mines will again yield this amount when properly worked. The whole sum from Russia, Europe, and America, makes nearly 2,000,000 pounds avoidance.

SIMCOE. [ CAMADA, S. S.]

SIMETHIS, a genus of Plants belonging to the natural order Liliaceae, and the tribe Antirrhineae. The parts of the perianth are six, spreading, deciduous; the stamens are attached to the base of the perianth; the filaments bearded; the anthers incumbent; the capsules are 3-celled, and each cell contains two seeds.

S. bicolor is a recent addition to the British Flora. It is a native of the South of Europe, and is found on sandy heaths near the sea-shore. In England it was first found at Bourne-mouth, in Dorsetshire. It has also been found at Derryman, Kerry, in Ireland. This plant has linear leaves, flat, or a little keeled upwards. The flowers are panicked, the petals are purple without, and white within. In Hooker and Arnott's "British Flora," it is suggested that this plant may have been introduced with trees from France.

SIMIADE. In the list of the specimens of *Mammalia* published by Dr. J. E. Gray, we find almost a complete representation of this family. They are as follows—

Of the above list, 496 were found in the Upper Silurian; 4,835 in the Lower Silurian; and 19 in the Cambrian.

SILVER. The ores from which the silver of commerce is mostly obtained are the Vitreous Silver, Brittle or Black Silver-Ore, Red Silver-Ore, and Horn Silver, in addition to Native Silver. Besides these, silver is obtained in large quantities from galena (lead-ore), and from different ores of copper; and some galenas are so rich in silver that the lead is neglected for the more precious metal. This metal occurs in rocks of various ages, in gneiss, and allied rocks, in porphyry, trap, sandstone, limestone, and shale; and the sandstone and shales may appear as recent as the middle secondary, as is the case in Prussia. The silver-ores are associated often with ores of lead, zinc, copper, cobalt, and antimony, and the usual gangue is calcite or quartz, with frequently fluor spar, or silver spar. The Silver of South America is derived principally from the Horn Silver and Brittle Silver-Ores, including Arseni-ursted Silver-Ore, Vitreous Silver-Ore, and Native Silver. Those of Mexico are of nearly the same character. Besides, there are earthy ores called Colorado, and in Peru Pacas, which are mostly earthy oxide of iron, with a little dis-

The Finches (I. Eisopus, Desm.; I. Eisopus, Linn.). Brazil.

The following forms of Simiades and Cebidae were existing in the Gardens of the Zoological Society, Regent's Park, between the years 1847 and 1852:

Simiades.

Simia Satyrus, Hylobates Hoolook, Semnopithecus Galenus.

SIP
687
SIPRONOSTOMES. [Scoticia craca.ens].
SIPUNCULOIDEA, an order of Echinoedematous Animals, embracing the families SIPUNCULIDAE, Priapulidae, and Thalassembridae. This order is defined as follows: The cutaneous envelop is conspicuous and free from calcareous corpuscles; there is no calcareous ring about the oesophagus; the body is cylindrical; the digestive canal usually asymmetrical.
1. The SIPUNCULIDAE (Syphon-oncorn) have a retractable proboscis about as long as the body, and a circle of simple linear tentacles around its tip. In his 'History of British Star-Fishes,' Forbes refers three British species of SIPUNCULUS of other authors to this genus—S. nudus, S. papillosus, and S. Barsei.
2. The PRIAPULIDAE (Tailed-Worms) have a retractable proboscis about as long as the body, and a circle of simple linear tentacles around its tip. The following are British species of this genus:—S. Bernardus, S. Johnstoni, S. sacculus, S. tellinum, S. Forseni, S. granulosus, S. punctatus, and S. Palliatus.
3. Thalassembridae (Squid-Worms) have a body oval or oblong, with a long flabby appendage; vent at posterior extremity, tentacles none.
Thalassembrus (Cuvier) has a cylindrical body rounded and smooth behind; the proboscis retractile, short, furnished at one side with a long flabby worm-like head, which is not retractile. T. Nepigatus is a British species.
Echinarus (Cuvier) has a cylindrical body, set at its hinder extremity with four points, and a proboscis as in Thalassembrus.
[ECHINODERMATA; THALASEMA.] E. ocellatus is found in the Channel
(Monograph of Natural History; Gowe, Marine Zoology; Forb's, British Star-Fishes.)
SISMONDINE. [Minerajogy, S. J.]
SIITSOVA, a town in Bulgaria, is situated on a height above the right bank of the Danube, 27 miles above Rutsch-
schuk, and 25 miles below Nikolipol, and has about 21,000 inhabitants. The town is defended by a citadel, and inclosed by a dry ditch and palisade. The houses are low and ill-built. The mosques of which there are eight, are the only buildings now of considerable commercial, and is looked upon by the Bulgarians as their proper capital. In ordinary times it has a good trade in corn, hides, leather, foreign manufactures, and colonial pro-
ductions. The books and Austrains concluded a peace at Siatova in 1791.
SISMIHIUN. [Indiace.]
SIVATHEERUM (from Siva, an Indian deity), a genus of extinct animals belonging to the family of Elephasidae. The remains of species of this remarkable genus were found by Dr. Falconer and Colonel Caytel in the valley of Mack-
anda, in the Sewalk Hills of the Himalaya.
Two species of this genus, S. giganteum and S. Permense, have been described. A cranium, lower jaw and teeth, and some bones of S. giganteum are now in the British Museum. The skull of this animal is nearly as long as that of the Elephant, the neck was shorter and stronger than in the Giraffe. The posterior portion of the skull is greatly developed, and form of cellular cavities, as in the Elephant. "The face is short, and the nasal bones are remarkable for the manner in which they are prolonged into a pointed arch above the external nostrils, indicating a trunk, or proboscis. The very inclined direction of the front of the face is, and of the upper jaw, shows the animal was constructed for a physiognomy altogether peculiar. Two horns arise from the brow between the orbits, and diverge from each other, and is probable that the posterior protuberances of the fons also supported a pair of short massive horns."
(Mantell.)
When living, the Sivatherium must have resembled an immense Omu, or Antelope, with a short thick head sur-
mounted with two pairs of horns. The front pair of these horns were small, whilst those behind were probably pal-
mated. The eyes were small, and it had a nasal proboscis, an organ unknown amongst the Ruminantia.
(Mantell. Portefield and their Teachings; Journal of the Asiatic Society.)
SKATES. [Raiden, S. 2; Skata.]
SKENE, a genus of Gasteropodous Mollusca, named after Dr. Skene. The shell is very small, flat, and with few whorls. It is deeply umbilicated; the mouth is entire, circular, not produced, and connected with the pharynx by a pericardium rather spiral. The animal is nearly like that of Rissoa, and has large eyes. The species are few, and are found generally on the rocks of CornuYas officinalis.
SKIBBE, a town in Ireland, a market-town and the seat of a Poor-Law Union, is situated on the river Luan, in 51° 34' N. lat., 9° 16' W. long., distant by road 52 miles S.W. from Cork, and 201 miles S.W. from Dublin. The population in 1851 was 3806. Skibbereen Poor-Law Union comprises 28 electoral divisions, with an area of 115,000 acres, and a population in 1851 of 38,069. The town contains a churh, chapels for Roman Catholics and Wesleyan Methodists, two National schools, a court-house, a post-office, dispensary, bridewell, and Union workhouse. In the town are flour-mills and a brewery. Quarter and petty sessions are held. There are six yearly fairs, at which large quantities of yarns and coarse linens are sold.
SKULLCAP. [Scullaria, S. 1.]
SLATE. Slate is a harder and more compact variety than the common slate, of bluish and purplish shades of colour. The best slates come from Spain, Italy, and France. A good quality is quarried in Maine and Vermont, United States.
Novaculite, Home-Slate, or What-Stone, is a fine grained slate, containing considerable quartz, though the grains of this mineral are not perceptible. It occurs of light and dark shades of colour, and compact texture.
Argillite is a general term given to argillaceous or clay-
slate rocks. Some clays resemble slate, but are more friable; others crumble easily, and are unfit for any purpose in the arts, except to furnish a clayey soil.
Aramid Slate is any slate rock which contains decomposing pritties, and thus will afford alum or sulphate of alumina on lixiviation.
Bituminous Slate is a dark coloured slaty rock containing some bitumen, and giving off a bituminous odour.
Pumaginous Schist is a clay slate containing phumage or graphite, and leaving traces of black lead.
The Pipestone of the North American Indians was in part a red claystone or compacted clay from the Coteau de Prairies. It has been named Cattinise. A similar material, now accumulating, occurs on the north shore of Lake Supior, in the region around Neipigus. Neipigus is a trading-post, and is considered a valuable mine of graphite; hence the name. It is used by the Indian tribes both as a flint and as a neophyte tool.
SLEEMAN, SIR WILLIAM HENRY, K.C.B., the son of Philip Slemen, Esq., and grandson of Mr. John Slemen, died 27th December, 1788. In 1806, he became a cadet in the East India Com-
pany's service at Bengal. He served in the Nepaeulose war of 1812 with distinction; and at its conclusion being laid up with an illness which disqualified him for active employment, he spent fifteen months at the College of Fort William, during which time he made himself master of the history and language of the natives, and prepared himself for a career of future usefulness. In 1816 he commenced his service to Lord Moira (afterwards Marquis of Hastings), then Governor-General of India, who engaged him in an inquiry into the claims arising out of the war in Nepaul, and in 1820 was appointed agent in the Saugar and Nerbudda districts. Here he employed his energies in the extinction of the atrocious systems of Thuggee and Dacoty, on which he wrote several able pamphlets; he at the same time produced a larger work, entitled 'Military Discipline in our Indian Army.' In 1842 he was commissioned by Lord Ellen-
borough to report on the condition of Bondelucia; and in 1849 he was sent to the United States, to see that the variety of pipes in the hands of Lord Dalfouse, who employed him in preparing for the reduction of Oude under British laws. As a proof of the necessity for adopting strict measures, it should be men-
tioned that while residing at Delhi, he intercepted a letter sent from the King of Persia to the King of Oude, in which the former spoke hopefully of a Persian invasion of India, and proposed in that event to secure to him his throne, on condition of betraying the English into his hands. He also wrote a 'Treatise on Political Economy,' and a 'Review
and Analysis of the Peculiar Doctrines of the System of Political Economy founded by Ricardo. His most popular work was his "Diary in India" (1828), and his "Rambles and Recollections of an Indian Officer" (1843), a work which has been pronounced by competent authorities to be the best adapted of all existing treatises on British India, to give an Englishman a faithful picture of the actual state of that country and of the character of its inhabitants.

He lived to see his measures with regard to Oude carried into effect by his successor, Sir James Outram, and to hear of the proclamation of Lord Dalhousie, and the establishment of the Rajah as governor of that district. His health gave way towards the close of 1855, and he died at sea on his return to England, February 10, 1856, a few days after having been created a Knight Commander of the Bath, at the special request of Lord Dalhousie, to mark his valuable services in the furtherance of the cause of religion and humanity by the suppression of Thuggee.

SMITH, JAMES, the great propagator of the system of deep ploughing and thorough draining, was born at Glasgow on the 3rd of January 1789. His father had been in business in Glasgow, in which he acquired some property, but died when the son was but a boy of fifteen months. The child was then placed in the charge of his mother, who was a daughter of Mr. Buchanan, of Carston in Stirling. After her husband's death Mr. Smith resided with her brother, who was the manager of an extensive cotton manufacture at Deanston, a few miles from Stirling. Mr. Smith received a classical education at home, and completed it at the University of Glasgow. On leaving the university he returned to his uncle, who had by this time removed to the Catrine Works in Ayrshire, where, in order to attain a thorough knowledge of the trade, he worked through the various grades, labouring with persevering industry for twelve hours a day, with such good effect that at eighteen he was entrusted with the entire management of the works at Deanston, into which he subsequently introduced many improvements, promoting the labours of the labourers that were noticed with approval by Mr. Chadwick in his "Report on the Sanitary Condition of the Labouring Population of Great Britain," published in 1841.

But Mr. Smith's attention had been early given to agricultural processes, and his intimate acquaintance with manufacturing machinery was made available in gratifying his predilection. The Dalketh Farmers' Club having offered a prize of 600l. for a reaping-machine, Mr. Smith produced one, which, though it was not successful in obtaining the prize, yet proved the value of his invention, and he patented another in 1813. For this, though an accident prevented his gaining the prize, he received presents from several Scottish agricultural societies, and a gold medal from the Agricultural Society of Scotland. He had the management of a farm at the United Farm, and many of his experiments were eminently successful; but he could not obtain his uncle's consent to carry out a full development of his theories. In 1823 however he became possessed of the farm of Deanston, about 200 acres of extremely poor land, having a soil not averaging more than four inches in depth, formed chiefly of the debris of the old red sandstone, with a subsoil partly of sandy clay and partly of a compact soil with stones, and the whole interspersed with boulder stones, producing little but grasses in the wettest hollows and brook on the dry portions. The whole of this he intersected with drains, laid at distances of 31 feet and at a depth of 30 inches. This, and a subsoil plough to stir the ground deeply without bringing the subsoil to the surface, produced an effect on the crops that proved the soundness of his theory. In 1831 he published a pamphlet on 'Thorough Draining and Deep Ploughing,' which excited immediate attention among his more immediate neighbours, and it was several years before its merits were generally acknowledged and the practice it recommended was adopted.

In 1846 Mr. Smith was appointed one of a commission to inquire into the health and sanitary condition of our manufacturing districts, and the removal of the sewage for agricultural purposes; there were many difficulties to be overcome in effecting this, and Mr. Smith gave much attention to plans for overcoming them, proposing several means of circular mechanical ingenuity combined with simplicity. After considerable opposition an act of parliament was passed enabling municipalities to adopt his scheme where circumstances admitted of it. He also suggested several valuable improvements to the Agricultural Committees of the counties, of which he was a member, as he was also of the Glasgow Philosophical Society, to whose Transactions he was an occasional and valuable contributor. In political economy Mr. Smith was a follower of Adam Smith, and of course opposed to protection, holding that competitive trade, which he considered to be the birthright of the people of every country, was the best and most efficient form of trade. After a life of almost incessant activity, he died on the 10th of June 1850, somewhat suddenly, having retired to bed on the 9th apparently suffering nothing but an accustomary feeling of coldness. His remains were interred in the churchyard of Stirling.

SMITH, JAMES and HORACE, were the sons of Robert Smith, of London, an eminent legal practitioner and Solicitor to the Ordinance. James Smith was born Feb. 10, 1775, in London, where also Horace Smith was born in 1780. James Smith was a member of the same bar as his father, and Horace Rev. Mr. Burford, at Chigwell, in Essex, was articled to his father, and in due time was taken into partnership. He eventually succeeded his father in the business and in the appointment of Solicitor to the Ordinance. Horace Smith became by profession a stockbroker.

The first literary productions of the two brothers were gratifying contributions to 'The Pic-Nic,' a periodical started by Colonel Greyville, in 1802. 'The Pic-Nic' was soon merged into 'The Bell,' and continued to appear till July, 1803, when it was discontinued. When the 'London Review' was started by Cumberland, the dramatist, on the principle of each writer affixing his name to his criticism, James Smith wrote one of the articles, but the 'London Review' also ceased to appear in 1803. James Smith and Horace Smith wrote several of the Prefaces to a new edition of 'Bell's British Theatre,' which was published about this time under the sanction of Cumberland's name. They were also contributors from 1807 to 1813 to the 'Month,' a review in which they annually appeared the poetical imitations entitled 'Horace in London,' which were subsequently published in a small volume. Horace Smith wrote several of these parodies, but the larger number was the work of his brother.

The celebrity, however, which the two brothers enjoyed arose chiefly from the 'Rejected Addresses,' a small volume which was published on the opening of the new Drury Lane Theatre, in October 1812. The committee of management had issued an advertisement requesting that addresses, one of which should be spoken on the first night, might be sent in by way of competition. As all the addresses sent in, except one, were to be rejected, Mr. Ward, secretary to the theatre, casually stated the idea of publishing a series of imitation addresses, which idea was immediately adopted by the committee before the opening of the theatre. The brothers eagerly adopted the suggestion, and having immediately settled what authors each should imitate, Horace left London on a visit to the south of England, and James Smith executed his portion of the task returned to London a few days before the opening of the theatre. Each then submitted his productions to the other; a few verbal alterations were made, a few lines were added, and the little book was immediately printed and published. It was received by the public with enthusiastic delight. As the 'Rejected Addresses' are humorous imitations mostly of authors well known, and the work is still in circulation, it is perhaps worth while to mention the imitations of Wortworth ('Baby's Deber'), Cobbett ("Hampshire Farmer's Address"), Southey ("The Rebuilding"), Coleridge ("Playhouse Musings"), and Crabbe ("The Theatre"), are by James Smith, as well as the so-called 'Drury Lane Hysteric,' the 'Theatrical Alarm Bell' (an imitation of the editor of the 'Morning Post'), and the travesties 'Macbeth,' 'George Barnwell,' and 'The Stranger.' The rest of the imitations are by Horace Smith. The copyright, which was originally offered to Mr. Murray for 20l. was purchased by him in 1819, after the sixteenth edition, for 1000l.

Besides a great number of amusing trifles which James Smith contributed to the periodical literature of the day, he was a gratifying contributor to the earlier series of theatrical essays. In 1792 Charles Mathews displayed his extraordinary power of humorous imitation. Subsequently, for the 'County Cousins,' the 'Trips to Paris,' 'Air-Ballooning,' and the 'Trip to America,' he received from Mr. Mathews altogether 1000l. You are the only man in London," said Mathews to James Smith, "who can write what I want, good nonsense."
The brothers were both admired for their conversational powers. James Smith especially had a large circle of acquaintances, and went much into society. Though he was always a man of temperate habits, he became in middle life subject to attacks of gout, which increased in frequency and severity till he gradually lost the use of his limbs, and could only move himself by the aid of crutches. He died in London, December 34, 1859. In early and middle life he was distinguished for his personal beauty both of figure and face. He was never married.

Horus Smith contributed numerous pieces of poetry, half puerile, half sentimental, to the "New Monthly Magazine," while its standard editor, it is said, thought him a "very promising young poet." He was also the author of about twenty novels, of about three volumes each, the greater part of which seem to have been little known except to the regular novel-reading circles of the circulating libraries. "Gaieties and Gravities," published in 1831, was one of the earliest of his novels. "Love and Memoriam," 1845, was the latest. In the intermediate two years he gave to the public "Brambletye House," "Tor Hill," "Reuben Apsey," "Zella," "New Forest," "Walter Colyton," "Jane Lomma," The Moneyed Man," "Adam Brown," "Arthur Arundel," and others. Horace Smith died July 12, 1848, at Tunbridge Wells. He was a widower, and left two daughters.

(Memoirs, Letters, and Comic Miscellanies in Prose and Verse) by the late James Smith, Esq., one of the authors of the "Brambletye House," written by his brother, Horace Smith, Esq., 2 vols., 8vo, 1840.)

SMITH, JOHN PYE, D.D., LL.D., one of the most learned ministers and theological tutors of the Independent order. On a survey we shall make of his life, we shall find that May 29, 1774. In his early years he was employed in the shop of his father, who carried on a respectable book-selling establishment in Sheffield; but always a diligent student, and becoming strongly impressed with religious feelings, he became desirous of engaging in the ministerial vocation. He accordingly left business, and in his twenty-second year entered the Independent Academy at Rotherham. Here he devoted himself zealously to the studies of the place, and thus the character of a religious and fervent young man was formed. He went from Rotherham to a variety of places in the Wesleyan Theological Academy, Mr. Smith was chosen in 1800 to occupy the post of classical tutor in that seminary. At Heaton he subsequently formed a church, of which he became pastor, and which increased so largely in numbers as to require a separate chapel. In 1807 he received the diploma of D.D. from Yale College, New Haven, Connecticut. In 1813 Dr. Pye Smith gave up the situation of resident classical tutor, retaining at the request of the directors the post of divinity tutor. In 1814 he was deprived of the position of tutor by the college, Aberdeen. Dr. Smith became again in 1843 the resident tutor at Homerton, which office he filled till the breaking up of the establishment in 1850. When New College, St. Andrews, was removed to Edinburgh, he was transferred to Highbury, and Coward Colleges. Dr. Pye Smith, who had been for many years afflicted with deafness, then retired from active duty, and his friends and admirers testified their regard for his character by raising a sum of 3000L, to provide an annuity for him while he lived, the interest to be afterwards devoted to the foundation of a Smith scholarship in New College. Dr. Pye Smith died on February 5, 1861, in his seventy-seventh year. Dr. Pye Smith was held in unusual regard by all who knew him, as much for the singularly meek and humble nature of his character, as for his earnestness and devotion in his official duties, and his extensive erudition. He had been twice married.

Dr. Smith was a man of untiring industry, as well as of very unusual acquirements. He published numerous works on theology and on science, especially the science of geology. His great work was "The Scripture Testimony to the Messiah," 2 vols., 1815 and 1816. The remarkable range of learning which this work displayed, and particularly its familiarity with the most important subjects of science and scripture, was the attainment with English divines, and especially with those of the Nonconformist body, attracted great attention to the work, and though some of the positions of the author were regarded with disapproval by such as regarded the work with him in his general theological views, it at once took a high place, and eventually came to be pretty generally regarded as a standard work on the subject of the divinity of Christ, and as perhaps the most important work of the kind on the orthodox side of the question. In subsequent ed...
book and its contents is really the point on which our esti-
mate both of the man and the doctrine must to a great extent
turn, it will be best given in his own words and without
abridgment. He says:—"On the evening of the 21st of
September, A.D. 1823, while I was praying unto God
and endeavouring to exercise faith in the precious promises
of Scripture, I was suddenly and unexpectedly filled
with a purer and more glorious appearance and brightness,
burst into the room; indeed, the first sight was as though
the house was filled with consuming fire. The appearance
produced a book. I opened the book; and to my amaze-
ment a passage stood before me surrounded with a glory
yet greater than that with which I was already surrounded.
The messenger proclaimed himself to be an angel of God,
sent to bring the joyful tidings, that the covenant which God
made with Abraham was to be fulfilled. I was at home,
the preparatory work for the second coming of the Messiah
was speedily to commence; that the time was at hand for
the Gospel in all its fulness to be preached in power unto
all nations, that a people might be prepared for the Mille-
ennial reign.

I was informed also concerning the aboriginal inhab-
its of this country (America) and shown who they were,
and from whence they came;—a brief sketch of their origin,
progress, and present state of society, with all the moral
righteousness and inequality, and the blessings of God being
finally withdrawn from them as a people, was made known
unto me. I also was told where there were deposited some
plates, on which was engraved an abridgment of the records of
the ancients, the history of the world, and the existence, birth,
and mission of the angel appeared to me three times the same
night, and unfolded the same things. After having received
many visits from the angels of God, unfolding the majesty
and glory of the events that should transpire in the last few
years, the morning of the 22nd of September, 1827, the angel
of the Lord delivered the records into my hands.

These records were engraved on plates which had the
appearance of gold; each plate was six inches wide and
eight inches long, and not quite as thick as a finger, and
They were filled with engravings in Egyptian characters,
and bound together as leaves of a book, with three rings running through the whole.
The volume was something near six inches in thickness, a part of which was
sealed. The characters on the unsealed part were small and beautifully
engraved. The whole book exhibited many marks of antiquity in its construction, and much skill in the
art of engraving. With the records was found a curious instrument which the ancients called 'Urim and Thummim,'
which consisted of two transparent stones set in the rim on a bow fastened to a breastplate. Through the medium of the Urim and Thummim I translated the record by the gift and power of God.

The important and interesting book the history of
ancient America is unfolded from its first settlement by
a colony that came from the tower of Babel, at the confusion
of languages, to the beginning of the 5th century of the
Christian era.

We are informed by these records, that America, in
ancient times, has been inhabited by two distinct races of
people. The first were called Jaredites, and came directly
from the tower of Babel. The second race came directly
from the city of Jerusalem, about 600 years before Christ.
They were principally Israelites of the descendants of Joseph.
The Jaredites were destroyed about the time that the Israelites
came from Jerusalem, who succeeded them in the in-
habitants of the country. The principal nation of the
second race flourished towards the close of the 4th cen-
tury. This book also tells us that our Saviour made his
appearance upon this continent after his resurrection; that
they had apostles, prophets, pastors, teachers, and evan-
gelists; the same ordinances, gifts, powers, and blessing was as enjoyed on the
eastern continent; that the people were cut off in con-
sequence of their transgressions; that the last of the prophets
who existed among them was commanded to write an abrid-
gement of the records that had existed on this continent. To
it he gave a name, that it should come forth and be united with the
Bible, for the accomplishment of the purposes of God in
the last days. For a more particular account I would refer to the
book of Mormon.

We must here for a while interrupt the Prophet's narra-
tive. It will have been noticed that the account of his
early life, and of his proceedings between the first appear-
ance of the angel and the discovery of the plates, is remark-
ably vague. His education had evidently been of the rudest
kind. From various accounts, including those of his mother,
it would seem that he used to assist his father in his busi-
ness, but that he was of an unsettled disposition, and pro-
bably spent a good deal of time in wandering about the
pleasant countryside on the hills of Moroni, with a spade
by trying for mineral veins by a divining-rod, and some
affirm that, like Sirephel, he used "the devil's looking-
glass—a stone," and was consulted as to the discovery of
treasures, of prehistoric buildings, etc. It was commonly
known as the "money-digger;" and on one occasion he had
been, at the instigation of a disappointed client, imprisoned
as a vagabond. He is also stated to have carried off and
married a Miss Hale, during the interval between the first
anachronistic appearance of the angel and the efforts to
fulfil the prophecy. As to the Book of Mormon itself, the
authorship has been claimed for one Solomon Spalding, a Presbyterian
preacher, who having fallen into poverty composed a religious romance,
entitled "The Manuscript Found," which promised to be
a narrative of the migration of the Lost Tribes of Israel from
Jerusalem to America, and their subsequent adventures on
that continent, in the hope of obtaining enough from its pub-
lication to release him from his difficulties. The work was
written in 1799; and ten years after his death, the manuscript was carried by his
wife into New York, where it was stolen by or somehow
got into the hands of Smith, or Rigdon (an early associate in his proceedings).
The statement is supported by affidavits said to have been executed by
Smith, and some other persons, who declare that they had heard
him read portions of the work which were substantially the same
as parts of the Book of Mormon. The story is inco-
herent in its details and the authenticity of the writings does not seem clear; but the book itself appears to agree
very well with such an origin, supposing, that is, that the
Presbyterian preacher, as might well have been the case, was
a rude-minded uneducated man, sufficiently familiar with
the language of the Bible, and acquainted with the
language and scriptural allusions of his time in its
language, and using the easily-obtained in-
formation respecting the ruins of ancient "towns and
temples," which have been discovered in various parts of
America, as a ground-work for his narrative. The book
is (even now that its grosser grammatical errors are said
to have been expunged) a singularly ill-written one, and
how any decently-educated man could have written it as a book to be read for amusement would be inconceivable, were it not that experience teaches us that authors are by no means
unfrequently mistaken in that respect. At the same
there is certainly nothing in the book to contradict the sup-
position that it is the work of Smith himself—for as to its
being a divine revelation, the most cursory examination of
the contents of the book is sufficient to convict it of utter
improbability of that, if its possibility were otherwise
conceivable. Be the author who he may, Smith having ob-
tained the book—whether from Solomon Spalding's tra-
bulating competent to transcribe the data, and the brain of
which the angel discovered to him—thought it behoved him
to make his treasure known. At first he told the members of his
own and his father's household, and, more fortunate
than Mahomet, found little difficulty in persuading them of the
truth of his mission and the reality of the gift. But
he says:—"As soon as the news of this discovery was made
known, false reports, misrepresentation, and slander flew, as
on the wings of the wind, in every direction. My house
was frequently beset by mobs and evil-designing persons; several
of the people, I believe, whenever they saw a new
device was made use of to get the plates away from me,
but the power and blessing of God attended me, and several
began to believe my testimony."

Among those whom he visited the discovery was a farmer
named Martin Harris, whom he persuaded to convert his stock
into money in order to assist in printing the book. But Harris
wanted to consult some scholar, and Smith was induced
to entrust him with a copy of a portion of one of the gold
disks. Ye it was that Martin Harris, in the sight of a large
company, opened the disk to show the character, and
Anthon, who according to the triumphant declaration of
the Mormons, was unable to make out the characters, which
he described as being "reformed Egyptian"—and this is
the same as written by Morris in the "History of the auth-
enticity of the book. But Dr. Anthon's own account of
is different. He says that he at first supposed the paper to be
a hoax, and gave little heed to it; but on hearing the man's
story, he assurred him that the work was an imposture, and strongly advised him not to have anything to do with it. The paper itself he thus describes (and it is the only description of the 'Book of Mormon' which has been published). The paper consisted of all kinds of crooked characters, disposed in columns, and had evidently been prepared by some person who had before him, at the time, a book containing various alphabets. Greek and Hebrew letters, crosses and flourishers, Roman numerals, and thousand, were written in the margin of the columns, and in perpendicular columns, and the whole ended in a rude delineation of a circle divided into various compartments, decked with various strange marks, and evidently copied after the Mexican calendar, given by Humboldt. A translation followed in such a way as to show it was an utter fabrication. To this it is added that the people were not readily deceived."

Letter Day Saints was first organised, in the town of Manchester, Ontario county, state of New York. Some few were called and ordained by the spirit of revelation and prophecy, and began to preach as the spirit gave them utterance, and though armed and strengthened by the power of God; and many were brought to the water, being immersed in the water, and were filled with the Holy Ghost by the laying on of hands. They saw visions and prophesied, devils were cast out, and the sick healed by the laying on of hands. The work rolled on like a snowball; and rapidity, and churches were soon formed in the states of New York, Pennsylvania, Ohio, Indiana, Illinois, and Missouri. In the last-named state a considerable settlement was formed after Jackson county; numbers joined the church, and we were increasing rapidly, and the little bands that had been here were now spread over a large tract of country. Our farms teemed with plenty, and peace and happiness were enjoyed in our domestic circle and throughout our neighbourhood; but as we could not associate with our neighbours — who were many of them of the basest of cast — Smith had fled from the face of civilised society to the frontier country to escape the hands of justice—in their midnight revels, their Sabbath-breaking, horse-racing, they commenced at first to ridicule, then to persecute, and finally an organised mob was formed. No effort was too great to drive us out of our homes, to whip many of our brethren [Smith himself was tarred and feathered], and finally drove them from their habitations; these, housesless and homeless, contrary to law, justice, and humanity, the children till the children left their blood on the prairie. This took place in the month of November (1833)."

The government, he says, winked at these proceedings, and the result was, that a great many of them died; many children were left orphans; many houses, widows, widowers, were left in a state of wretchedness."

No sooner was the discovery published, than great curiosity was manifested by the faithful as well as by unbelievers, to obtain a sight of the marvellous plates, and the Prophet and his mother gave a minute account of the shifts to which he was driven to obtain them. At length it was revealed to him that the desired sight should be vouchsafed to three witnesses—whose 'testimony' is prefixed to every printed copy of the 'Book of Mormon.' These witnesses aver, after more than a season's experience, that angels of God came down from Heaven, and brought into their presence, with which, as a child, they beheld and saw the plates, and the engravings thereon.

This is sufficiently vague, and it is noteworthy that the more detailed account of this transaction by the Prophet's mother, has just the same vagueness as to what manner of vision this was. But a more specific testimony was given by eight other witnesses, to whom Smith was permitted to show the plates. Mrs. Smith says that these eight men went with Joseph into a secret place 'where the family was not permitted to follow.' And he comforted them with the assurance that the plates were a guarantee of resurrection to God. They went to this place because it had been revealed to Joseph that the plates would be carried by one of the ancient Nephites. Here it was that eight witnesses saw the plates, and were shown by the angel to whom the plates were handed, to whom they were sealed.

The witnesses themselves say—"We have seen and hefted, and know of a certainty that the said Smith has got the plates of which we have spoken." Of these eight witnesses three were members of Smith's own family. After these witnesses had seen the plates, Mrs. Smith tells us, "The angel again made his appearance to Joseph; at which time Joseph delivered up the plates into the angel's hands; and Joseph himself says, 'I, the angel, delivered up the plates into the hands of Mr. Smith.'"

The angel then charged them not to speak of the matter, unless they were in danger of death. The witnesses were not required to speak of the matter to any one; and if they were asked, they were to say that they had only seen the plates, and that they were not qualified to give any account of them."

An admirable site having been purchased by them on the Mississippi, at the head of the Des Moines Rapids, they "in the fall of 1839" laid the foundation of their famous city of Nauvoo, or the Beautiful, for which the state legislature granted them in December 1840 a charter of incorporation with unusual privileges. Smith dwells with great delight on this city, which he had seen rise up under his presidency from a wild tract to be a place of "1500 well-built houses, with all the facilities for living had by him for temporal as well as spiritual guidance. Among the chief things which he describes as provided for, was "the University of Nauvoo, where all the arts and sciences will grow with the growth, and strengthened with the strength of this beloved city of the saints of the last days." The greatest feature of the city was the great temple, which Smith thus describes:—"The temple of God, now in the course of erection, being already raised one story, and which is 180 feet by 90 feet, of stone with polished pilasters, of an entire round form, on a plan consisting of a double temple of worship of God, as well as unique wonder of the world, it being built by the direct revelation of Jesus Christ for the salvation of the living and the dead."
various kinds bestrid Smith, but he escaped from them all. He had in 1841 been arrested on a charge of sedition, &c., but being carried before the authorities of Nauvoo, he was set free after the death of the ex-governor of Missouri, and he deemed it prudent to conceal himself for a time, but eventually surrendered, and being able to prove that he was "some hundreds of miles distance" from the scene of the sedition. Among his followers too there were occasional symptoms of disaffection, but they never extended widely, and were easily suppressed. With the gentiles settled in Nauvoo, and whom he could not keep out, he had more trouble; and, as a result, the great majority of the Mormons were being expelled from the city. Smith himself felt this expulsion of the Mormons from their former cities followed them here, and suspicion and hatred gathered about them. But Smith from the foundation of Nauvoo had been making provision against this danger. He had procured the arms in secret, as is affirmed, from among Smith's declared enemies; and his followers braced their nerves to endurance by the remembrance of their master's fate and example. In Nauvoo itself the impression produced by the event was most profound. At first the popular cry was only for revenge, but their leaders exhorted them to forbearance, and succeeded in their exhortations. They then proceeded to elect a successor to Smith. Three candidates put forward their claims to the prophet's place. The choice of the council fell on Brigham Young, who was elected, took measures to remove his people far beyond the farthest settlements of his countrymen, convinced now that only in a country far distant from societies living under the established forms, could any real opportunity be obtained for the realisation of the only stipulation made with his enemies was that they should be unmolested till they could finish and dedicate their beautiful temple; and as soon as that was accomplished, September 1846, the last band of the brethren departed from the land of their hopes to seek a new land of promise.

Shortly before Smith's death he estimated his followers at upwards of 150,000, and declared that they were to be found among almost every civilised people on the face of the earth. And yet the whole of 1844 and 1845 were marked by the diffusion of his disciples, but that their number was very great, and that they were widely spread, there can be little doubt. To what extent, if any, they have since increased, we need not now stay to inquire. Their present condition will be more properly noticed in another article [Uran., S. 3]. It only remains now to state their doctrines as enunciated by Smith, and this will be best done in the creed which he forwarded a few months before his death for the use of his church. Thus, he wrote:

"We believe in God the Eternal Father, and his Son Jesus Christ, and in the Holy Ghost."

"We believe that men will be punished for their own sins, and transgressions;"

"We believe that through the atonement of Christ all men may be saved, by obedience to the laws and ordinances of the Gospel."

"We believe that those ordinances are—1st, Faith in the Lord Jesus Christ; 2nd, Repentance; 3rd, Baptism by immersion for the remission of sins; 4th, Laying on of hands for the gift of the Holy Spirit."

"We believe that a man must be called of God by prophecy, and by laying on of hands by those who are in authority, to preach the Gospel and administer the ordinances thereof."

"We believe in the same organisation that existed in the primitive church, namely, apostles, prophets, pastors, teachers, evangelists."

"We believe in the gift of tongues, prophecy, revelation, visions, healing, interpretation of tongues, &c."

"We believe the Bible to be the Word of God, so far as it is translated correctly; we also believe the Book of Mormon to be the Word of God."

"We believe all that God has revealed, all that he does now reveal; and we believe that he will yet reveal many great and important things pertaining to the kingdom of God."

"We believe in the literal gathering of Israel, and in the restoration of the Ten Tribes; that Zion will be established upon this (the Western) continent. That Christ will reign personally upon the earth; and that the earth will be renewed and receive its paradioc glory."

"We claim the privileges of worshipping Almighty God
according to the dictates of our conscience, unmolested, and allow all men the same privilege, let them worship how, where, or what they may.

We believe in being subject to kings, presidents, rulers, and magistrates; in obeying, honouring, and sustaining the law.

"We believe in being honest, true, chaste, benevolent, virtuous, and in doing good to all men: indeed we may say this of all things. But as he was engaged in very various and different things, we 'hope all things,' we have endured very many things, and hope to be able to endure all things. If there is anything virtuous, lovely, or of good report, or praiseworthy, we seek them all.

In this creed it will be seen that there is no reference to what is now commonly regarded as the characteristic feature of the Mormon system—polygamy, nor has it been mentioned in connection with Smith himself. There is no doubt that during the last year of Smith's life, this was one of the charges brought against the Mormons, but the doctrine of a plurality of wives was never openly taught until after his death, and if he proclaimed it at all, he confined the revelation to the initiated. He is said however to have "sealed" to himself "plural wives," as the Mormons express it, to two years before his death; and the privilege may have been accorded to some of the chief of his followers. But the doctrine in its present form is one of the "developmenta of the Smithites.

SMITH, ADMIRAL SIR SIRNEY, was born at Westminister in 1765, and in his twelfth year was sent as a midshipman on board the Sandwich, Lord Rodney. At the age of sixteen he was made lieutenant, and at nineteen post-captain. In 1793, he was made captain of the South East. In Sweden, he obtained permission to offer himself as a volunteer to the latter power, in whose service he showed so much courage and skill as to lead to his investment with the order of the Lion. On the surrender of Toulon to Lord Hood, August 1793, Captain Smith commanded the south of Europe, unemployed, hastened thither, and offered his services, which were accepted; and on the evacuation of the city in the following December, the destruction of the French ships of war, the capture of the lectores, and the taking of the magazines, arsenal, and stores, was entrusted to him. On his return to England he was appointed to the command of the Diamond, with a small flotilla, charged to cruise in the Channel. He succeeded in considerably annoying the enemy, but in attempting to cut out a ship at Havre he was made prisoner.

After a confinement of over two years, Captain Smith, by the assistance of a French officer named Philippeaux, made his escape and reached England in safety. Appointed to the command of 74 guns, and in 1798 Sir Sidney proceeded to Constantinople, and thence to Acre, which, as the key of Syria, was then closely invested by Bonaparte at the head of 10,000 men. Sir Sidney, with advantage adapted for the purpose intended, namely, that of exciting the student, rather than as satisfying all the requirements of the student; nevertheless they contain a useful commentary on the events: the first two series, though the briefest, being perhaps the best. In 1860 was also printed, for private circulation, what is called an 'Occasional Lecture.' It is a pleasant little pamphlet, occasioned by the desire of a lady to hear a lecture, of which it takes the form. It is an eloquent on woman, displaying considerable originality of thought and diction, and is dated 1814. In 1845 he published his last work, 'Evidences of Christianit,' and on June 24th, 1849, he died at Norwich, after having worthily occupied his professorial chair for forty years. In 1851 a painted window by Warrington, representing the 'Adoration of the Magi,' was erected by some of his friends to his memory in the north aisle of Norwich Cathedral.

SNAKE-FISH. [Coryph.]

SNEET-FISH. [M. Coryph.]

SNOW-BERRY. [Coryne. S. 2]

SNOW-BUNTING. [Emberiza. S. 2]

SNOWDROP. [Galanthus.]

SOBA-AJUM. [M. Mysalop.] 

SOLAN. [Solan.] 

SOLASTERIE, or SOLASTERIRE. [Solan.] 

SOLASTREIRE, or SOLASTERINE, a sub-family or "Asteridae, including those forms of Star-Fishes which have two ranks of suckers in each avenue. There are two British genera, "Ordalia and "Solaster."

Ordalia has only a few rays covered with spines-bearing

4 N 3
wars; the intermediate spases porous; the avenues bordered by two sets of spines.

There are two species which are not uncommon on the shores of the British Islands, C. oculata and C. rosea.

Solaster (Forbes) has many rays studded over with bunches of spines; the avenues bordered by three sets of spines.

S. popea, the Rosy Sun-Star, is common on the eastern coasts of Great Britain, where, on account of its numerous rays, it is called Two-Fingers. It is a deep red or orange-red color. On the British Islands, S. rosea.

SOLDANELLA, a genus of plants belonging to the natural order Primulaceae. Some of the species are slightly purgative.

SOLDAILL [WARWICKSHIRE].

SOLITARY BIRD. [Dodo.]

SOLOMON'S SEAL, the common name of the species of Polygonatum, a genus of Plants belonging to the natural order Liliaceae, and the sub-order Asparagaceae.

Polygonatum has the perianth tubular, 6-toothed, tardily deciduous; the ovary 3-celled: cells 3-ovulate; the stigma blunt, trigonous; berry with 1-seeded cells; the flowers not jointed to pedicel. There are three British species.

S. verticillatum has linear-lanceolate whorled leaves, with an erect angular stem. It is a rare plant in Great Britain.

P. officinarum. Solomon's Seal, has leaves ovate-oblong, half-capping, glabrous, stem angular: peduncles 1-3-flowered; filaments glabrous. It is the Consolarius Polygonarum of Linnaeus, and is confirmed with the following. It is only found in Scotland.

P. multiflorum has leaves ovate-oblong, half-capping, glabrous, alternate; stem round; peduncles one or many-flowered; filaments downy. This plant is the common species of the sub-order Asparagaceae.

SOMERVILLE. [MINERALOGY, S. I.]

SOMMITE. [NAPPELINE.]

SOPHIA, a city in Bulgaria in European Turkey, situated on the route from Constantinople to Belgrade, about midway between Nissa and Philippopolis, near the point indicated by 43° 37' N. lat., 22° 27' E. long., in a wide plain bounded by high ramifications of the Balkan, and traversed by the Iaca, a feeder of the Danube, and has about 10,000 inhabitants, the greater part of whom are Christians. It is a large place, and has a beautiful appearance from a distance, but the streets are narrow, tortuous, dirty, and lined by high mud walls, which here and there inclose good houses, but in general the houses are poorly built. It has a great number of mosques and Christian churches, which are the principal buildings in the city; there are also a large and well-frequented bazaar, public baths (which are supplied from a hot-spring), and khans. The chief industrial products are—knitted-stocking, for which the city is celebrated, bottled beer, henna, leather, and tobacco. Sophia was formerly the residence of a pasha and capital of an eyalet of the same name, but the eyalet is now named from its capital, Nissa, called by the Turks, Sis, which was elevated to a Grand archbishop and to a Catholic bishop. There are hot-springs in the environs. Sophia is a place of considerable commerce. It was founded by the emperor Justinian on the site of the ancient Sardico. The only remains of antiquity are the ruins of the church founded by Justinian. Sardico is famous for the council held in it a.d. 347, which confirmed the decree of the Pope acquitting St. Athanasius of the charges brought against him at the council of Antioch. The council of Sardico also passed twenty-two canons, one of which enacts a bishop condemned by a provincial council to appeal to the Pope, is a consecrated bishop, to the number of about eighty, withdrew from the council of Sardico to the town of Philippopolis, and held what they called the council of Sardico, in which they pronounced sentences of excommunication against Onis, St. Athanasius, and the Pope. (Frontier Lands of the Christian and Turk; L'Art de Visiter les Datas.)

SORDAWALITE. [MINERALOGY, S. I.]

SORD, [Craw.] (1602-1667).

SORREL, WOOD [OCCALES.]

SOULIE, MELCHIOR-FRÉDÉRIC, one of the most fertile writers of the French Romantic school, was the son of a teacher of philosophy at Toulouse, and was born at Foix, in the department of Ariege, December 22, 1800. In 1829 he wrote his father having obtained employment at Nantes, Frédéric Soulé commenced his studies at the Lycée of that city; and afterwards completed them at Poitiers, Paris, and Reuens, so migratory was his early life. In 1828 he accompanied his father to Laval, where the elder Soulé had received an appointment in a public office, and in this office the future novelist laboured also assiduously for several years. The object of his father had been to prepare him for the bar, and young Soulé having spent several years in the study of law, avocacy, and waited for his briefs like other barristers. But his inclinations were for literature; he wrote pretty verses for his amusement, his letters already displayed an elegant style, and a vein of exquisite pathos, if not of the highest perfection, pervaded all his productions. In 1825 his father's dissolutive life brought the family once more to Paris; when the young poet published a volume of fugitive pieces under the title of 'Amours Francaises.' The book did not sell; but several of the poems it contained have since sold many thousand copies. From that time forth he was a man of letters, and his work was produced at the Odéon his 'Christine à Fontainebleau,' but it failed; and in 1830 he began to write critical articles for the Mercure, the Figaro, and the Voleur, in all of which his genial spirit sought consolation for his own failure, by his career and continued for twenty years, 1830-49, in which period the work was produced at the Théâtre Français in 1831 with better success, was followed in 1833 by his Cloître, the triumph of which, both on the stage and in the drawing-room, was about completed.

Shortly after his Cloître, which established his reputation as a dramatic writer, Frédéric Soulé began to contribute a series of romances in the shape of feuilletons to the newspapers. In this new and lucrative class of literature, he became and continued for twenty years, 1830-49, in which period the work was produced at the Théâtre Français in 1831 with better success, was followed in 1833 by his Cloître, the triumph of which, both on the stage and in the drawing-room, was about completed.

In 1834 he was in Paris. During the period of the July Monarchy, he was a writer for one of the popular French romancers. The Deux Cadavres" was published in this form in 1833; the Vicomte de Beziers in 1834; the Comte de Toulouse in 1835; the Comte de Foix in 1836; 'Un Évêque à Rome' and 'Deux Sœurs' in 1837; 'L'Homme de Lettres,' in 1838. In this manner upwards of thirty fictions, some of them of considerable length, were produced. In 1842 appeared his Mémoires du Diable, the sale of which was immense. It was a commentary on the work of Eugène Sue, and was undertaken by Eugène Sue to undertake his Mystères de Paris. Soon after the success of Sue and Dumas in the same class of writing somewhat obscured the fame of Frédéric Soulé, who witnessed their sudden popularity without jealousy, although he was a little vexed at the preference accorded to those whose proprietors to the last paid him liberally for his work. In 1846 he brought an estate at Blavre, where he died September 22, 1847.
led the attack of the left at the battle of Weissenberg, and repulsed a body of Austrians. His next service was in the Palatinate under General Lefebvre, who entrusted him with the command of a division of light infantry. In 1794 Soult was created colonel, and was one of the most distinguished officers present at the great battle of Fleurus, June 26. He displayed great skill by his dispositions in this action, and in the action of the 21st. At the battle of Fleurus, he was vaccinated, but he was not entirely defeated. Shortly after this victory, being detached with 500 horse to cover the left of the army at Herborn, he was suddenly hemmed in by the enemy's cavalry, amounting, it is said, to 2000 horse, this being the general régime; conduct which was not forgotten in after days.

In 1799 he joined the army of the Upper Rhine, under Jourdan, and at the head of the vanguard of the left wing was present at the battle of Stockach, March 25. Though the battle was eventually won, after a fierce struggle, by the Archduke Charles and the Austrians, such was the opinion entertained of Soult's skilful conduct, that the Directory promoted him to a division on April 31st, while Jourdan, the commander-in-chief, lost credit and command by the same action. Soon after, he found himself under the orders of Massena, who, besides his own army in the Alps, had lately succeeded to the command of that on the Rhine, after Jourdan's disgrace. Under Massena, he was appointed to the post of chief of staff. On April 30th, June 4, 1799, when the Austrians were defeated, and France preserved from invasion. In 1800, when Massena shut himself up in the walls of Genoa, General Soult was one of the most active of its defenders during the siege, distinguishing himself highly in the numerous skirmishes which took place beneath its walls. He was wounded and taken prisoner in one of these sorties, but recovered his liberty after Napoleon's victory of Marengo.

On the 14th of June, 1800, the military command of Piedmont was conferred upon General Soult; who was next despatched with a corps of 15,000 men to occupy the peninsula of Otrante; but after the peace of Amiens, he was superseded in this government by General Montholon. Soult was then placed in the Dalmatian front during the lapse of hostilities, and though, for some unexplained cause, he was not personally a favourite with Bonaparte, on the recommendation of Massena he was one of the four colonels of the Consular Guard. The rupture between England and France soon followed, and it was General Soult who organised the vast armament collected on the heights of Boulogne, known as the Army of England. Meanwhile, the French Empire had been formed, and so astounding had been the events paid by Soult to the First Consul during the short period of transition, that although he had served neither in the first campaigns in Italy, 1796-97, nor in that of Egypt, 1798-99, nor even yet fought under Napoleon, nor commanded an army in the field, his name was included in the list of French marshals created at the coronation.

In the campaign of 1805 Marshal Soult obtained still greater distinction; his services at the battle of Austerlitz, December 2, being so efficient, that Napoleon thanked him on the battle-ground, before his马, during one of the first of living strategists. Thereupon, and after the end of the war, he ranked as one of the leading generals of France, to whom the greatest undertakings might be committed with confidence. In 1805, when France was assured of success, he took part in the campaigns of 1806 and 1807. After the battle of Jena, October 14, 1806, he defeated Marshal Kalkreuth, captured Magdeburg, and put to flight the Prussian General Blücher, and the Russian General Lestocq. Before Copenhagen, when the long-continued war of taking the place. Soon after this check, King Joseph returned to Madrid, leaving the marshals in command of the Army of the South, consisting of the 1st, 4th, and 5th corps. The year 1810 was almost entirely occupied by the marshals in establishing a settlement in Andalusia; but the wide contortions over which his troops were disper-
exposed them to loss in petty skirmishes with the enemy, who, supported by the strong fortress of Badajos to fall back upon, had a great advantage over him. In the beginning of 1811, Napoleon, who felt the urgent necessity of supporting Massena in Portugal, ordered Soult to besiege Badajos, but he had the place on the 11th of March, 1811, the Prince of Essling, unable to penetrate the strong lines of Torres Vedras, found it necessary to abandon Portugal.

The departure of a British army, having relieved the English army from one of their most formidable opponents, Lord Wellington determined to recapture Badajos, for which purpose he despatched Beresford to invest it. The siege was opened on the 7th of May, 1811; Soult came to its relief, and, although at first it seemed that he could oustrip his opponent in a race of success,—through means of his greater superiority in numbers he inflicted great loss upon Beresford's army—he was thoroughly defeated. The fall of Badajos now appeared inevitable, and, the departure of a British army, the most septet, ordered Marshal Marmont, who had succeeded Massena in the command of the army of Portugal, to push forward to his support. This movement rendered it necessary for Wellington to raise the siege on the 16th of June. However, in the following spring, encouraged by the capture of Ciudad Rodrigo, Wellington laid siege a second time to the fort of Badajos, and—though not without terrible loss—the place was carried on the 6th of April, 1812. Soult was in consequence compelled to retreat from Beville, his retreat being several marches long. The consequent defeat of Marmont at the battle of Salamanca (July 22, 1812), and the surrender of Madrid to the British general, compelled Joseph Bonaparte to withdraw before the allies. A number of Soult's detachments retreated and ordered to join him. Accordingly, to his deep regret, he marched out of Andalusia, and on the 10th of November took the command of the three combined French armies stationed on the Tormes. This junction of forces was too powerful to be attacked; Lord Wellington therefore fall back upon Ciudad Rodrigo, with a heavy loss of troops on his route, and went into winter quarters. After his departure from the rich province of Andalusia, which he had occupied for nearly three years, Soult found himself involved in a great struggle against Marshal Soult for the great extortions levied on the people by himself and his agents, and his shameless and unbridled robbery of pictures and articles of value. The reports of military men of every army engaged in the Peninsular war have fully corroborated the charges; while the enormous wealth which he ostentatiously displayed after the peace seemed to indicate that he did not feel the disgrace his atrocious conduct had drawn upon his name. For a few months during the year 1813, Soult was employed in the German campaign; and in May of that year he was laid down from the command of his guard, after the death of Marshal Bessieres at Weissenfels.

But the disastrous defeat of Marshal Jourdan at Vitoria, on the 21st of June, 1813, having thrown off all fear of loss of Spain, after an occupation of five years, but the security of the French soil, Napoleon was once more compelled to employ Soult in the Peninsula, though it was not without some sense of shame that he sent him there. Accordingly, in July, Soult returned to Spain as commander-in-chief of the French armies. Then followed the most arduous period in his career; and although—overmatched by the genius of Wellington—nearly every enterprise was a failure, and every battle was a check, the French never despaired. The fall of Pamplona, the battles of San Marcial and Sorauen, succeeded, in all of which the marsh was worsted; then he took up a strong position on the banks of the Bidasoa, but was driven from it by the leader before whom so many marshals had succumbed. The losses of Napoleon in Champagne required some relief, and thousands of Soult's veterans were drafted off; his German troops deserted him. Still, with the resources at his hand, and placing, had enabled him to defend himself the marshal formed a strong position on the Nive. He was driven from this river, he took up a strong position on the Nive, whence his impetuous enemy dislodged him; but, without being depressed, he offered the English army a bloody battle, and with the loss of 8,000 men. Wellington had at last entered the French territory in the south, whilst in the north Napoleon was falling back before the allied armies. But even then he did not despair. A trace of a few weeks was forced upon the opposing armies after November, when both sought winter quarters. But early in February 1814 the war was renewed. The battle on the Adour, the battle of Orthes, the battle of Tordes, succeeded each other, and were lost by the marshal. To complete his bankruptcy, he had been defeated by him in the battle of Bordeaux against the Bourbons, and the subsequent capitulation of Paris. Yet, even when the three allied armies were in possession of the capital, when Lyon had submitted, when so many marshals and generals were deserting Napoleon at Fontainebleau, he fall back upon Touloude, and there, in an admirable position which not even the impetuous valour of British troops could force without a carnage so fearful as almost to balance their own victory. The loss of the French was however more than commensurate, and the adven- new for the second time, in September 1814, he wrote to the king requesting leave to resign. His request was granted; but in order to mark his appreciation of the serv- tures of the marshal, Louis-Philippe re-established in his government, and, without his title, that of Marshal of France, which had not been borne by any subject since the death of Marshall Turenne. From that time the marshal went to live in retirement, to which he confined himself more closely still after the revolution of February 1848. His health and strength had long been shaken; the marshal grew worse during the year 1851, and breathed his last at the castle of Soult-Berg, on the 26th of November in that year. After his death his splendid gallery of Spanish pictures collected by him during his Spanish campaigns was sold by his son, and the proceeds of the sale were placed in a trust fund. The best of these pictures are now in the Imperial Galleries of France. The "Mémoires du Maréchal General Soult, duc de Dalmatie, publié par son fils. 1ère partie. Histoire des guerres de la conquête de l'Italie," appeared in three vols. 8vo, with an Atlas, Paris, 1864.

SOUTH AUSTRALIA. Under this head, in Supplement 1, an account of the geographical features of the colony was given. It has risen since into greater importance, and is better known. We therefore add the following particulars:

The climate of South Australia is one of the finest in the world, resembling that of the south of Italy. The atmosphere is pure and elastic, and favorable for the variety and brilliancy of its colours. There are no prevalent diseases. On entering the country some are attacked with dysentery, which with a little care may be avoided. Adelaide has been occasionally visited with infeduza; and at particular seasons there are some cases of ophthalmia, which is rather a swelling of the eyelids, caused by a small insect. The seasons are divided into dry and wet. The dry season begins at the end of August and con-}

Digitized by Google
metal, in the form of a pure oxide requiring no flux to smelt it, the heat of a blacksmith's forge suffice to run the metal. The lode is 17 feet wide, of great extent, and is quarried by open stone pits. The output in 1856 was 20,000 tons of copper ore, valued at 360 per ton. The lead-mines are Glen Osmond and Wheatley mines, about six miles south from Adelaide, and the Wheat Gawler and Yatalainga mines, the first two yielding 76 per cent of metallic.

The native races of South Australia, like those of New South Wales, belong to that race which is called Negro Australian. They have not yet attained an equal degree of civilisation and refinement. Two or more distinct races, each of which has been adopted for their improvement with some degree of success. There are schools at Adelaide and Port Lincoln for the education of the children. Connected with the latter is a training institution under the superintendence of Archdeacon Hall, in which the youths are kept separate from the tribe, and instructed in the Christian religion and in some industrial pursuit. A number of youths are employed on stockholders' stations along the Murray, though it appears certain that all the natives of the southern and eastern coast of Australia speak the same language, a marked difference exists in the dialects spoken in different parts. Various dialects are used within the territories of South Australia; one is spoken by the few isolated families among the restless Aborigines who live in the wilderness and the tribes inhabiting the vicinity of Adelaide; and the tribes along the banks of the Murray below the junction of the Darling, have been found to use four different dialects, three of which were unintelligible to natives from the neighbourhood of Lakes Murchison and Moonta. The other parts of the colony are generally peaceful and inoffensive.

The settled parts of the colony have been distributed into the counties of Fleurieu, Barra, Stanley, Gawler, Light, Eyre, Adelaide, Sturt, Hindmarsh, Grey, Robe, Russell, all lying to the eastward of the gulfs of Spencer and St. Vincent; and the county of Flinders on the south-west shore of Spencer gulf. A township has been laid out at Port Wakefield, at the head of the gulf of St. Vincent, where a considerable quantity of salt is produced from the sea water shipped for Swansea. Roads and bridges have been liberally provided for as settlements have been formed.

The population of South Australia in 1858 was 97,887. The government of the colony is vested in a lieutenant-governor, an executive council and a legislative council. The executive council consists of the governor, the colonial secretary, the advocate-general, and the surveyor-general. The legislative council, which was instituted in 1856, in terms of all previous parliaments, consists of 36 members, 12 of whom are nominated by the crown, and 16 are elected by 10l. householders and the possessors of freehold property of the value of 100L. sterling, in the 16 districts into which the colony is divided for the purposes of representation. The members of the executive council, and of the legislative council, and the persons on the jury list, form the body of voters for the purposes of the franchise. The executive council meets when summoned by the governor, and not less than once in three months, and the legislative council when convened by the governor, or at the request of 10l. householders in any district, and not less than once in three months. The salaries of the executive council is 100L. sterling per annum, and the legislative council 100L. sterling per annum.

For the promotion of education in the colony, an inspector of schools has been appointed. Schoolmasters obtain an annual grant of 20l. for the first 30 scholars, and 1l. for each additional scholar, the aid however in no case rising above 40l. per annum. The following are the returns for the year 1856: The number of imparished children in January 1856, was 69, with about 3300 scholars. The amount paid to teachers during the year was about 3100L.

In 1858 there were about 180 places of worship in the colony. The ministers of religion are of all the churches of England, under the superintendence of the Bishop of Aden.
SOUTH MOLTON. [DEVONSHIRE.]

SOUTHERNWOOD. [HEREFORDSHIRE.]

SOUTHEY, CAROLINE ANNÉ. (better known as Caroline Bowles), the second wife of Robert Southey, was the only child of Captain Charles Bowles, of Buckland, near Lymington, Hampshire, where she was born December 6, 1787, and where she spent the whole of her days, with the exception of a few months in 1808, when she went to London. Miss Bowles was described by her brother as a woman of great learning and refinement, who was the object of the esteem of all who knew her. Her name was known, and her friendship eagerly sought after. Miss Bowles first appeared before the public as an author in 1820, when her poem 'Ellen Fitz-Arthur' was published, but without her name. Indeed it was not till many years later that any of her works were issued under her name, though their authorship was no secret in literary circles. In 1822 she published 'The Widow's Tale, and other Poems'; in 1836 'Solitary Hours' (prose and poetry); and in 1839, in two volumes, 'Sketches on Churchyards', which had already appeared in 'Blackwood's Magazine', where they had excited much interest. In June 1839, as already mentioned, Miss Bowles was married at Bedle Church, in the New Forest, to Robert Southey. Some time after their marriage, Miss Bowles, although the eldest child of the house, was allowed to exercise her literary talents. In 1841 she published a sonnet to the memory of her father, and in 1842 she wrote a poem on the death of her mother. In 1843 she published a poem on Robin Hood, commended by Southey, which she published in 1847, and afterwards in collecting

to the prevailing winds; but the great expense and delay in the transport of merchandise between the city and the port was much lessened, and the number of vessels which called on which vessels of 1000 tons burden can be raised, a wet dock, a church, a Presbyterian chapel, a theatre, and numerous shops.

The population of Adelaide, Port Adelaide, and Albert Town, is about 15,000, and consists of persons of all ages and all classes. The soil is rich and fertile, and the climate is healthy and invigorating. The town is well supplied with water, and has a good system of streets and squares. The architecture is neat and substantial, and the houses are built of stone, brick, or wood, and are well adapted to the climate. The streets are broad and regular, and the squares are large and spacious. The town is well lighted and ventilated, and the air is pure and invigorating. The town is well supplied with water, and has a good system of streets and squares. her husband's letters, which have since been edited by Mr. Wartier. The poetry of Caroline Bowles is of a kind that will always give pleasure to persons of a reflective turn of mind, and much is truly beautiful. It is tender, graceful, and, though somewhat melancholy, pervaded by a fine moral tone; but it is diffuse, and wanting in strength of thought and passion.

Every successful writer was living on a new vacation, and had begun to diffuse new and more rational ideas among a class, who do not always think for themselves, when his health gave way, and death put an end to his useful labours, on the 5th of July 1854. Having married a second time, he left behind him a widow and three daughters.

SOWERBY, GEORGE BRETTINGHAM, second son of James Sowerby, one of a numerous family distinguished as naturalists, or natural history artists, was born at Lambeth on the 12th of August 1768, and died on the 50th of July 1854. He studied natural history with more success than his older brother, perhaps on account of his not being so good an artist. In early life he was attached to the study of Entomology, and assisted his father in those departments of his labours where a knowledge of insects was required. On marrying however he gave up his Entomology, and commenced business as a dealer in natural history objects, and visited the Continent of Europe for the purpose of obtaining specimens. He bought the celebrated Tankerville collection of shells, for which he gave six thousand pounds. He also bought several other large collections. His knowledge of the forms of shells was very extensive, and he projected and published a great work entitled 'The Genera of recent and Fossil Shells.' This was published in 1820. In 1824 his father and brother executed the drawings and engravings, and he drew up the descriptions. His papers on various species of Mollusca are very numerous, and were published in the 'Zoological Journal,' the 'Proceedings of the Zoological Society,' the 'Magazine of Natural History,' and the 'Reports of the British Association.' A list of these papers, upwards of forty in number, is given in Agassiz's and Sturckland's 'Bibliography of Zoology,' published by the Ray Society. Besides these papers, he executed work on the genera of shells which he published several other important works; and amongst these should be mentioned the Catalogue of the collection of the late Earl of Tankerville, 'Species Conchylorium, or concise original Descriptions and Observations of all the Species of recent Shells with their Varieties,' London, 1830. 'Conchological Illustrations, or coloured figures of all the hitherto unfigured recent Shells, with their Varieties,' London, 1832-45. 'Thesaurus Conchylorium, or Figures and Descriptions of Conchylorium,' London, 1842. He was a Fellow of the Linnean Society.

SOWERBY, CHARLES EDWARD, third son of James Sowerby, was born on Feb. 1st, 1785, and died in June 1848. He assisted first his father and afterwards his brother James de Carle in their natural history publications. In 1821, when the copyright of 'English Botany' falling to his share, he commenced the publication of a second edition on small paper, with large additions. This work has been reprinted by his son, John Edward Sowerby.

SPAIN. Since our previous account very material alterations have taken place, which we shall briefly indicate. The first is the subdivision of the old provinces for administrative purposes, which we subjoin, with the population in 1849, the latest return available; but by a return not yet published, the total population it seems amounts to about 17,000,000.

**Commerce and Manufactures.**—Spain, from the extent of its coast-line, its large ports of Cadiz, Cartagena, and Ferrol, the number of its smaller harbours, its geographical position, and its abundance of natural productions, possesses very great commercial advantages, but those advantages have been diminished, and in a great measure destroyed, by the restrictive laws of the government. Smuggling to an enormous extent is carried on almost everywhere along the coast, especially at and near Gibraltar, and also from France, across the Pyrenees, and from Portugal across the frontier. The articles smuggled through Gibraltar consist of cottons, linens, muslins, thread, stockings, and the like, and tobacco to a large amount. The total import into Spain during the year 1869 amounted to 867,171,795 reals (about 6,160,000l.). Of these course are the registered imports. The amount of goods smuggled into the country cannot be estimated. The value of the goods smuggled during the same year amounted to about 6,000,000l. The imports consist of wool, wine, brandy, oil, fruits, chestnuts and nuts, cork, quicksilver, indigo, with a lead, and salt, with a small quantity of silk and manufactured goods. Of late years a large amount of wheat and flour has been exported from the northern provinces, chiefly to Cuba and Brazil. The manufacturing industry, formerly considerable, has greatly declined; and the grape-vine disease ( oidium ) has very materially lessened their manufacture and exportation of wine. The government has still manufactures of tobacco, saltpetre, gunpowder, cannon, fire-arms, and porcelain, but they are all in a decayed state except the manufacture of Seville. Other manufactures are silks, coarse cottons and woollens, and leather. Cutlery and iron-ware are made to some amount in the Basque Provinces and Asturias. 

**Roads, Canals, and Railroads.**—The public roads in Spain, except those that reach the capital, are not very well made. The railway lines completed in January 1858, are— from Barcelona to Arens del Mar, 23 miles; from Barcelona to Granollers, 19 miles; from Barcelona to Martorell, about 20 miles; from Barcelona to Tarrasa, 22 miles; from Valencia to Albacete, 173 miles; Reina to Alar de Rey, 32 miles.

**Revenue.—**The budget proposed for 1857 amounted to 20,030,000l.; the ordinary receipts were estimated at 14,400,000l., leaving a deficiency to be supplied of 5,630,000l. The amount of the public debt in November 1856 was 141,200,000l., on which the interest payable was 2,277,000l., in addition to a loan of 8,330,000l. recently contracted for. The army and navy are under Military and Naval Forces, S. S. 1,400,000l.

**Religion and Education.**—The established religion is the Roman Catholic, and no other is allowed in the Spanish dominions. The crown presents the archbishop and bishops, whose titles are confirmed by the Pope. The clergy was at one time immense. After the revolution of 1818, the monastic orders were suppressed, and the convents and the lands belonging to them were sold; but the convents of nunns were suffered to remain till the death of the then occupants. A law was passed in 1856 for the sale of the whole of the church-property, and its conversion to secular uses; which law was revoked, at least so far as the property unsold, in 1877; and an indemnity to the clergy of upwards of 2,500,000l. has been introduced to the Cortes, but has not yet (May, 1858) been adopted.

Education is very little diffused. The lower classes receive little or no instruction, except in the principal cities, where infant-schools have of late years been established. The children of the upper classes are educated at home, in France and other countries. The universities, formerly numerous and of great reputation, are now reduced to about 14, and those are attended by only a comparatively small number of students in theology, law, and medicine. There are, however, several academies and literary societies in Madrid, Cadiz, Seville, and other large cities.

**History.**—After the queen-mother, Christina, had been appointed queen-regent (Reina Gobernadora), Don Carlos, the brother of Fernando VII., laid claim to the throne on the ground that the Salic law female for the succession was declared null and void by the civil war ensued, which lasted till September, 1840, when the partisans of Don Carlos were finally defeated, and the sovereignty of Isabella established. Early in 1856 the government of the province of Barcelona was brought under the measures of the Spanish government, interdictory measures been introduced in Barcelona and other places. On the 22nd
of February the whole kingdom was declared in a state of siege. On the 16th of July the city and garrison of Narvaez were invested by the number, from independence (or declamation) against the government. This was followed, July 17, by an insurrection in Madrid. The streets were barricaded, and the people fought against the soldiers till July 19, when the rebels gave up the contest, and a National Junta was established.Eventually the constitutional government was re-established; and the queen-mother was banished from the kingdom, August 28, 1834. In June, 1836, a revolution took place, and General Benavides was reinstated in power. The influence of climate, soil, elevation, &c., on species, would save much trouble and vexation on this point. De Candolle has elegantly summed up the influence of these agents on plants—"Let us suppose," he says, "what really happens, that the seeds of plants are scattered at haphazard on the surface of the earth; or, to speak more correctly, by causes that have no necessary connection with the existence of those plants; such seeds will find themselves in an infinite variety of situations; some will have lain in soil that is too tenacious or too loose, too dry or too wet, too hot or too cold, do not grow, and are soon destroyed. But between these extremes some will succeed, although it may be under very different circumstances. Thus, for instance, if the place that not light will be held by those which will be indicated by its paleness and feebleness, or by being spotted, or by the diminution or even loss of its hairs; if the light is too bright, the plant will be stronger, smaller, more deeply coloured, harder, and more velvety than usual. Tem- perature is the same. If there is a cold climate the same plants are smaller and weaker than ordinary, the colour of the flowers and fruit is paler, the wood worse ripened, their leaves more deciduous, their flowers of a more abundant perfume, &c.; it is often desired to nourish it throwing itself into the neighbour of a warmer heat and light. In a hot climate plants become larger, produce more wood, and their leaves have brighter colours and a higher flavour. In the same climate humidity causes the same effect with the plant, its flowers and fruits becoming larger, its leaves more numerous; plants that grow in water lose all their hairs, their leaves become divided into capillary segments so as to look like hairy roots, their stems and flower-stalks lengths to reach the surface of the water, and these different effects are further variable as the water is still or agitated, clear or turbid, pure or mixed with heterogeneous substances; the varieties of Rannunculus aquatilis offer a remarkable example of this. If, on the other hand, a plant accustomed to water is found to live in a drier soil, it becomes smaller, its leaves become less numerous, its flowers and acquires greater hardness. In air rarified like that of mountains, plants are generally found smaller and more stunted than usual, while their flowers are larger than upon the plains. The influence of soil is not less manifest: if it is tenacious, the roots, which are indurated with it, grow slowly, small, hard, and clustered; if it is very sandy, the roots become large, flabby, and fully formed; if it contains a great quantity of carbon, the colours of the flower are often altered, as those of the Hydrangea into blue, and of the Pink into violet; if it is charged with salt, or if the plant is within the reach of salt, even brought through the atmosphere, we usually find the leaves more flabby and more glaucous, as in Eucalyptus. All these different circumstances, combined with each other in nature, are fertile causes of varieties, which are still further multiplied by cultivation.

SPREADWELL. [Vronidra.] SPHENOPS. [Scincopinae.] SPHINCTILITE. [Minerals, S. 5.] SPIDERS. [Arachnida, Araneida, S. 2.] SPONTINI, GASPARD; a celebrated Italian dramatic composer, was born at Jesi, in the Roman States, in the year 1776. After studying the principles of music under Padre Martini at Bologna, he entered, at the age of thirteen, the conservatory of St. Cecilia, and was received with great renown. At seventeen he composed his first opera, 'I Puntigoli delle Donna,' which spread his name over Italy, and led to the favourable reception of a long series of dramas, one of which, the 'Paride,' as soon as it came under the management of the French opera; his principal works, 'La Vestale,' 'Olympia,' and 'Fernand Cortez,' having been composed for and produced at the Académie Royale de Musique. Of these works 'La Vestale' acquired the greatest celebrity. Having been adapted both to the Italian and the German stage, it was

performed in every great musical theatre in Europe, and for a time had almost as much popularity as the works of Rossini himself. Spontini passed many years of the latter period of his life in Berlin, and died at the Prussian capital, and held this office at the time of his death, January 21, 1851.

SPURGE LAUREL. [Daphne].
STAG-BEETLES. [Lucanidae.].
STAINBRIDGE. [P.].

STALYBRIDGE, Lancashire, a market-town in the parish of Ashton-under-Lyne, is situated chiefly on the river Tame, in 53° 30' N. lat., 2° 4' W. long., distant 8 miles from Manchester and 81 miles from London, by N. from London by road, and 198 miles by the London and North-Western railway via Trent Valley. The population of the town in 1851 was 20,760. The living is a perpetual curacy in the archdeaconry and diocese of Manchester. Stalybridge owes its importance chiefly to the cotton manufacture. Woollen-cloth is manufactured to some extent; there are also brass and iron foundries, machine-making factories, brickfields, collieries, stone-quarries, and corn-mills. The parochial chapel is an octagonal structure occupying an elevated site, and there are three district churches, chapels for Wesleyan, Primitive, New Connexion and Association Methodists, and for Independents, Baptists, and Roman Catholics; National, British, and Roman Catholic Schools, and Sunday schools, in operation. Saturday is the market-day; fairs are held on Easter Monday and November 5th.

STAMP DUTIES. That the relaxing of a heavy tax, while it conveys great advantages to the public, does not always involve a loss of revenue, has been strikingly shown in the example of the postage rates, as well as in many other cases, of which the Stamp Duties form one. In 1850 and 1854 great alterations and reductions were made by the 13 & 14 Vict., cap. 97, the 16 & 17 Vict., caps. 59 & 60, and the 17 & 18 Vict., cap. 53. That the acts were altogether a great boon to the post office and to the public, is the point to which there are not two opinions. The effect upon the revenue will be seen from the following figures:

In the year ending Jan. 5, 1850, the stamp produced by the Stamp Duties was £5,667,648.
In the year ending March 31, 1855, £7,532,239.

It must, however, be taken into account that the Succession Duties were then first passed. But in 1852 the stamp duties amounted to 6,761,634l.; and the penny receipt duty has come into operation since.

In pointing out the difference between the former and the new duties, the ad valorum duties first claim attention.

Corporation Duties upon the Act of Property. — These duties show a considerable reduction in all purchases for sums not exceeding 200,000l. The highest ad valorum duty under the late law was 100%, but being no increase on sums not exceeding 100,000l.; the duty is now one uniform rate of 10% per cent. without limit; which, speaking in general terms, may be said to be about half the amount of the former duty on sums from 500l. to 100,000l. That duty was not a uniform percentage, as at present, but a fixed amount on all sums between those specified in the scale, being somewhat more or less than 17% per cent. as the purchase money approximated to the higher or lower amount in each step; on the mean sum it was precisely that rate. But on sums under £20 or over £100, for the most part, much higher, being as much as 41% per cent. on the mean sum under £20; 35% on that under £50, and 17% over £150. On purchases of small properties, therefore, the advantage is very great; and, referring to these, the justice and propriety of the new scale of duties will be more apparent. In giving a comparative advantage of the two duties a difficulty arises from the difference in the language of the two acts imposing them, in expressing the turning point; in the new act the words "over £20," and "below £100," and not substituted for "amounting to" and "not amounting to." The omission to charge the ad valorum duty on conveyances where the consideration was stock, whether in the funds, or of any company, is supplied.

The following copies of a table will exhibit at a glance the difference between the old and the new duties in all cases of sales for sums not exceeding 1000l.

<table>

Bonds and Mortgages. — These duties are also charged at one uniform rate throughout, viz., 2½d. for every 100l., and any portion of 100l., except that on sums not exceeding 300l. the duty is imposed by fities, so as to charge only 13d. on the fraction over 50l.; thus favouring minor transactions, instead of the more important ones and the old system. The regulations are, however, well adjusted and wholly indefensible upon principle; as will be perceived when it is stated that the duty on the mean sums in the scale, from not exceeding 60l. to not exceeding 20,000l., gradually diminished from 4½ per cent. to 2½ per cent.; the highest duty being 5½l., the lowest 0.001l. on 40,000l. was 1½d. per cent., and that this rate proportionately diminished with the increase in the amount of money secured.

The following is a comparison of old and new duties on bonds and mortgages for sums not exceeding 20,000l.:

<table>
<thead>
<tr>
<th>Amounting to</th>
<th>50 and not exceeding</th>
<th>50 and not exceeding</th>
</tr>
</thead>

</tbody>
</table>

At this point the old duties stopped, there being no increase beyond 2½l. whatever might have been the amount of money secured; but the new duties continue on, ad infinitum, at the rate of 1½d. per cent. for every additional 100l., and in proportion for less than 1000l. A mortgage, or (as in Scotland) a bond without penalty, for securing money to become due, without limit, is available as a security for such an amount, only, as the duty thereon extends to cover. In other such cases of bonds the duty is charged on the amount of the penalty. A mortgage for securing money by way of rent-charge or annuity is chargeable with ad valorum duty on the money advanced. The case of an advance under the Private Drainage Act (12 & 13 Vict. c. 100) is referred to in the work of a writer on the stamp laws (supplement to Tilsley's Treatise on the Stamp Laws, p. 26) as an instance in which this will apply.
which is greater as advance is made upwards. The new duty is 2l. for every 100l., and any fraction of 100l. per annum; the former duty was not a per centage, but, as in other cases, according to a scale, but not extending beyond 2000l. a year. The present duty is not limited.

A transfer of mortgage is now only ad valorem on the bond given for any other purpose than as a security for money, where the penalty is of comparatively small amount. Under the old law the duty in every such case was 1l. 15s., or some other fixed money duty as would be payable on a bond given for securing money to the same amount as the penalty, where such latter duty is less than the fixed sum. Bonds given as a collateral or additional security for money are likewise charged with ad valorem duty where it would otherwise be payable. The refunds under the new Act, however, take away the advantage of the former principle. The repealed duties on leases, computed on the mean sums in the scale, were as follows, viz. 10l. per cent. on rents under 20l.; 5l. per cent. on rents under 100l.; 3l. 6s. 8d. on rents under 200l.; and gradually decreasing to 1l. 6s. 3d. for rents under 2000l. or upwards being 1l. 10s. only. Relief for the most part to the agricultural interest no doubt prompted the adoption of so liberal a measure, but it will be found, perhaps, more advantageous to the owners and occupiers of property in large towns.

A lease of minerals reserving a portion of the produce, by reference to an annual maximum or minimum amount, is to be charged with duty on such amount; and where the fine or rent consists of corn, the duty is charged on the value, to be ascertained where there is no special contract by the returns published under the Tithe Commutation Act, of, in Scotland, the faro prices of the county.

Assignments and surrenders of leases not upon sale or mortgage are to be paid the same ad valorem duty, if not exceeding 1l. 15s., as the lease itself would be liable to.

The duties on leases in Ireland are to be the same as in England.

Settlement of Money.—All the advantage afforded by the new Act in respect of the ad valorem settlement duties is on sums not exceeding 600l. The new duty is 5s. for every 100l. unlimited, and any fraction of 100l. The lowest duty under the former law was 1l. 15s., which extended to cover any amount upwards of 200l. whereas, under the new Act, the maximum amounting to 20,000l. or upwards being 7s. per cent. on the mean sums under 1000l., and averaging less than 2s. 6d. on the mean sums above 1000l., and under 20,000l. Thus the order of duties is the same.

These are the ad valorem duties affected by the new Act; and they may be said to be the only ones connected with the transfer of property by way of sale or security. Reference will now be made to other alterations which afford almost uniform relief.

Transfer of Mortgage.—This is an important branch of conveyancing; but it appears from the work of the writer already referred to, that it is one that has been more perplexed than any other by the stamp law, purely or upon account of its weight, owing to doubts previously existing, to be an important duty, of the amount not considered to have been intended by the legislature. The shifting of a mortgage security from one to another is always a cause of vexation to the debtor; but to the poor man it is a matter of serious moment. Independently of professional charges for investigating the title, and for preparing the conveyance, the stamp duty was, of itself, an intolerable burden. The lowest ad valorem mortgage duty, oppressive as it was, amounted to only 1s. 6d. of which the 1s. 15s. 4d. was the ad valorem duty of mortgage was 1l. 15s.; and as in every instance a new covenant was, as a matter of course, contained in it, a further duty of 1l. 15s. became, under a recent authority, chargeable; and it is thus a duty which, on a mortgage on a lease for a year, of which hereafter, where that attached) upon every transfer of mortgage, whether the money secured was under 100l. or above 20,000l. This is now remitted. The maximum duty on a transfer of mortgage is 1l. 15s.; and where, if the transaction was a mortgage, instead of a transfer, the ad valorem duty would be less than 1l. 15s., then such ad valorem duty only is to be charged. Thus, for example, on a transfer of a mortgage for 100l., the stamp duty, instead of 3l. 10s. as the lowest amount, as heretofore, is reduced to 1l. 15s. This mortgage is relieved from one stamp of 1l. 15s.; and on all transfers where the money secured does not exceed 1400l. further proportionate relief is given. Where, on a transfer, the money secured is more than 1400l. duty is payable on such further advance. It was payable in lieu of one stamp of 1l. 15s.; now, in such a case, the new ad valorem duty is all that is chargeable.

Further Assurance and further Security.—These instruments, which have been charged with ad valorem duty, are now charged with that amount as a maximum; the ad valorem duty being payable where less than 1l. 15s.

Further Advance.—Besides the duty on the further money lent, 1l. 15s. was necessary if the deed contained any additional security, by covenant or otherwise, for the original sum. Now, merely the ad valorem duty on the further advance is requisite.

Bargain and Sale (or Lease) for a Year.—Whilst the cumbersome machinery of the former system was revolutionising the former principle. The repealed duties on leases, computed on the mean sums in the scale, were as follows, viz. 10l. per cent. on rents under 20l.; 5l. per cent. on rents under 100l.; 1l. 6s. 8d. on rents under 200l.; and gradually decreasing to 1l. 6s. 3d. for rents under 2000l. or upwards being 1l. 10s. only. Relief for the most part to the agricultural interest no doubt prompted the adoption of so liberal a measure, but it will be found, perhaps, more advantageous to the owners and occupiers of property in large towns.

A lease of minerals reserving a portion of the produce, by reference to an annual maximum or minimum amount, is to be charged with duty on such amount; and where the fine or rent consists of corn, the duty is charged on the value, to be ascertained where there is no special contract by the returns published under the Tithe Commutation Act, of, in Scotland, the faro prices of the county.

Assignments and surrenders of leases not upon sale or mortgage are to be paid the same ad valorem duty, if not exceeding 1l. 15s., as the lease itself would be liable to.

The duties on leases in Ireland are to be the same as in England.

Settlement of Money.—All the advantage afforded by the new Act in respect of the ad valorem settlement duties is on sums not exceeding 600l. The new duty is 5s. for every 100l. unlimited, and any fraction of 100l. The lowest duty under the former law was 1l. 15s., which extended to cover any amount upwards of 200l. whereas, under the new Act, the maximum amounting to 20,000l. or upwards being 7s. per cent. on the mean sums under 1000l., and averaging less than 2s. 6d. on the mean sums above 1000l., and under 20,000l. Thus the order of duties is the same.

These are the ad valorem duties affected by the new Act; and they may be said to be the only ones connected with the transfer of property by way of sale or security. Reference will now be made to other alterations which afford almost uniform relief.

Transfer of Mortgage.—This is an important branch of conveyancing; but it appears from the work of the writer already referred to, that it is one that has been more perplexed than any other by the stamp law, purely or upon account of its weight, owing to doubts previously existing, to be an important duty, of the amount not considered to have been intended by the legislature. The shifting of a mortgage security from one to another is always a cause of vexation to the debtor; but to the poor man it is a matter of serious moment. Independently of professional charges for investigating the title, and for preparing the conveyance, the stamp duty was, of itself, an intolerable burden. The lowest ad valorem mortgage duty, oppressive as it was, amounted to only 1s. 6d. of which the 1s. 15s. 4d. was the ad valorem duty of mortgage was 1l. 15s.; and as in every instance a new covenant was, as a matter of course, contained in it, a further duty of 1l. 15s. became, under a recent authority, chargeable; and it is thus a duty which, on a mortgage on a lease for a year, of which hereafter, where that attached) upon every transfer of mortgage, whether the money secured was under 100l. or above 20,000l. This is now remitted. The maximum duty on a transfer of mortgage is 1l. 15s.;
property the instruments charged with ad valorem duty are, of course, liable to tax under the new duty. In some instances the instrument was not subject to ad valorem duty. In the case of an ad
mitiance the instrument was charged with 1\(\frac{1}{4}\), or, where the yearly value did not exceed 1\(\times\), with 5\(\times\). By the new Act these duties are reduced to 2\(\frac{1}{2}\) and 6\(\frac{1}{2}\), whereas the 1\(\frac{1}{4}\) and 5\(\times\) were payable on a sale or mortgage. In all other cases the duty on an admissiace remains as before.

Covenant.—A particular duty is now for the first time charged on a deed of covenant. It was, it seems, apprehended that where the ad valorem duty bond duty was considerable, a practice might be resorted to of executing a covenant, as a security, which would be liable only as a common deed to 1\(\frac{1}{4}\), in lieu of giving a bond; it was therefore thought proper to impose an ad valorem duty on a deed of covenant, which duty it exceeded 1\(\frac{1}{2}\), 1\(\frac{1}{2}\). But relief is given in the case of a separate deed of covenant, executed on the sale or mortgage of any lands, for title, &c., by imposing 10\(\frac{1}{2}\); or less, where the duty on the conveyance is less.

Agreement.—The duty of 2\(\frac{1}{2}\), 6\(\frac{1}{2}\), on an ordinary agreement remains as before, except that this amount is sufficient for any quantity of words less than 30 folios, instead of merely a quantity not exceeding 15 folios. But in lieu of the lesser rate of 1\(\frac{1}{4}\), 6\(\frac{1}{2}\), in any quantity, and of 1\(\frac{1}{2}\), for every additional quantity of 15 folios, the duty is now 2\(\frac{1}{2}\), 6\(\frac{1}{2}\), for every such further quantity.

The advantage of this may be illustrated by the following example. A contract for the performance of any work according to plan and specification, the words and figures amounting altogether to 100 folios, the duty under the old law woul have been 1\(\frac{1}{2}\), and five times 1\(\frac{1}{2}\) for five entire quantities of 15 folios after the first, making altogether in all the new law the imposed duty is increased 2\(\frac{1}{2}\), twice 6\(\frac{1}{2}\), making only 15\(\frac{1}{2}\).

Charter, Precept, Resignation, and Seisin.—The duties on certain instruments in Scotland under these heads, are reduced from 3\(\frac{1}{2}\), to 2\(\frac{1}{2}\).

Warrant of Attorney.—The duties on securities of this description are as before, the same as on bonds, with a reduction of the duty on a warrant of attorney given as a collateral security, from 1\(\frac{1}{2}\) to 5\(\times\), where the duty on the principal instrument exceeds that amount; and also, where it is given for money exceeding 500\(\times\), for which the person giving it is under arrest. A warrant of attorney given for any other purpose than as a security for the payment of money or the transfer of stock is charged with 1\(\frac{1}{2}\), which is an increase, the former duty in such case being 1\(\frac{1}{2}\) only.

The foregoing are all the cases in which the duties have been altered by the new act; but there are some material provisions which it will be proper to glance at.

All the duties on the former Acts relating to Stamp Duties are kept in force, including exemptions.

Certain agreements for letting lands in Ireland which were charged with ad valorem duties as leases, but which, if in England would have been subject only to the duty of 2\(\frac{1}{2}\) 6\(\frac{1}{2}\), as agreements, are to be deemed to have been liable to the latter duty.

Any person receiving money for stamp duty (including legacy duty) and not applying it, is to be accountable to the Crown by summary process.

Transfers of mort, ages, further charges, and further securities executed before the 11th October, 1850, are not to be deemed to be liable to the additional duties already pointed out and attaching by reason of the decisions allowed to, but, in the cases of those acts put upon the same footing as those executed subsequently.

The terms on which instruments may be stamped after execution are materially varied. The penalty, in ordinary cases, payable on stamping an instrument executed before the passing of the Act is 10\(\frac{1}{2}\); upon payment of which and the duty, the stamp may be affixed. By the new Act the penalty is 10\(\frac{1}{2}\); and where the duty required exceeds 10\(\frac{1}{2}\), then, further interest at 6\(\frac{1}{2}\) per cent. per annum on the duty, calculated from the date of first execution or instrument, but no amount of interest beyond that of the duty is to be paid by way of penalty. In lieu of a receipt for the duty and penalty as formerly, a stamp denoting the payment of the duty is furnished. The advantage to the party is the same. Under the new law, if an instrument was stamped, but with an insufficient amount, the whole duty was to be paid without regard to what had been already paid before the Act; but now, the deficient duty only is required.

Where instruments are executed abroad, the commissioners are empowered to stamp them without penalty at any time within two months after they are received in this kingdom. Until this Act the procedure had to determine what stamp duty was payable in any case, so as to assure parties that the stamp on an instrument was sufficient. The Commissioners are now invested with a power to adjudicate in all such cases, and to certify by means of a particular stamp, that an instrument is duly stamped, and so to preclude all question upon the point. The fee for obtaining this adjudication is 10\(\frac{1}{2}\). An appeal is given to the Court of Exchequer.

The duties in Great Britain and Ireland are now assimilated, but it appears that a deed liable to Irish duty could not be stamped in London; and vice versa; this is now permitted.

By the Act of the 12 & 13 Vict. c. 80, the discount of 7\(\frac{1}{4}\), per cent. allowed on the purchase of receipt stamps, was taken away; by the act now under consideration it is restored.

Licences to insure against fire both in Great Britain and Ireland are necessary before any such insurance can be made; they were all formerly required, to be obtained annually, but by the new Act a licence is for 7\(\frac{1}{4}\) such a licence in Great Britain were to be permanent; the same provision is by the recent Act made as to Ireland.

One or two examples have already been given of the benefit to be derived from the new duty in particular transactions of small value; it will be well to furnish an instance or two more.

Take the case of a sale of a freehold property for 1500\(\times\), the conveyance consisting of 40 folios, that is one entire quantity of 15 folios after the first, and requiring, therefore, one progressive duty. Under the old law the duties would be as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ad valorem duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Progressive duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Total</td>
<td>1 (\frac{1}{2}).</td>
</tr>
</tbody>
</table>

Under the new Act the duties are:

<table>
<thead>
<tr>
<th>Description</th>
<th>Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ad valorem duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Progressive duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Total</td>
<td>1 (\frac{1}{2}).</td>
</tr>
</tbody>
</table>

Again, take a mortgage of a freehold estate for the same sum. The duties were the same in amount as on a sale, viz.:—

<table>
<thead>
<tr>
<th>Description</th>
<th>Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ad valorem duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Progressive duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Lease for a year duty</td>
<td>0 (\frac{1}{2}).</td>
</tr>
<tr>
<td>Total</td>
<td>1 (\frac{1}{2}).</td>
</tr>
</tbody>
</table>

The great feature of the 16 & 17 Vict. cap. 59, was the reduction of receipt stamps for all sums amounting to 40\(\times\) and upwards to an uniform rate of 1\(\frac{1}{2}\). The stamp may be either impressed or affixed, but must not be cancelled by the signature, and a penalty of 10\(\times\) is imposed for neglecting or refusing to give such a stamp with a receipt. The other provisions were—that indentures or covenants for an apprentice, clerk, &c., where no money was paid, was fixed at 2\(\frac{1}{2}\); debentures or certificates for drawbounts or bounties, 1\(\frac{1}{4}\); not exceeding 10\(\times\), 2\(\frac{1}{2}\); above 10\(\times\) and not exceeding 50\(\times\), and 5\(\times\), if above 50\(\times\); drafts or orders for payment of money on demand, 1\(\frac{1}{4}\); bankers' cheques and letters of credit sent abroad were exempt by the Act; but now, May 1858, a bill is passing through Parliament, by which all bankers' cheques are to bear a penny stamp; policies of assurance 5\(\frac{1}{2}\); 500\(\times\), up to 1000\(\times\); for every additional 1000\(\times\), up to 10000\(\times\), and 10\(\frac{1}{2}\) for every additional 1000\(\times\). (The fractional parts in each case carry the additional stamp). By cap. 63 the stamp on articles of attorney's clerk was reduced from 12\(\frac{1}{2}\) to 5\(\frac{1}{2}\); attorneys and conveyancers' certificates were lower—ed; and also the conveyance duties on feu-rents in Scotland.

The 17 & 18 Vict. c. 63, is for altering certain Stamp Duties, the effect of which is sufficiently shown by the new scale given in the schedule, which we subjoin. It is only necessary further to give the more material enactments set
indicated in the schedule. By § 4, bills purporting to be
drawn abroad are to be so deemed, though drawn in the
United Kingdom, and are chargeable with duty accordingly;
and the holder of a bill drawn out of the United Kingdom
(§ 8) is to affix an adhesive stamp of the proper amount
before negotiating it, and the neglect to do so, or to cancel the
stamp, incurs a penalty of 50L. Bills purporting to be
drawn in sets (§ 6) must be so drawn under a penalty of
100L. Unstamped drafts on bankers (§ 7) are not to be
circulated beyond fifteen miles from the place where
payable, under a penalty of 50L; but drafts (§ 8) law-
fully issued unstamped, may be circulated at any distance
by affixing and cancelling the proper stamp. Stamps (§ 10)
denoting the duty of one penny may be used for receipts or
drafts without regard to their special appropriation. All
bills, drafts, and notes (§ 19), except Bank of England
notes, are rendered liable to the stamp duty. The exemption
from the stamp duty (§ 13) of letters acknowledging the
receipt of bills, promissory notes, &c., is repealed; but receipts
for money paid to the Crown are still exempted. The stamp
duty on pawnbrokers' licences in Dublin (§ 20) is reduced
from 15L. to 7L. 10s. Instruments liable to stamp duty (§ 37)
are to be admitted in evidence in any criminal proceeding
although they be not stamped.

Schedule.—Inland bill of exchange, draft, or order for the
payment to the bearer, or to order, at any time otherwise
than on demand, of any sum of money.

<td>1 0 0</td>
</tr>
</tbody>
</table>

And where any such lease or tack as aforesaid shall be
granted in consideration of a fine, premium, or grasmum,
and also at a yearly rent, such lease or tack shall be
chargeable also, in respect of such fine, premium, or
grasmum, with the ad se laesum stamp duties granted under
the head or title of "conveyance" in the schedule an-
nexed to the Act passed in the 13 & 14 Vict. c. 97.

Exemption.—Any lease made in pursuance of the
Trinity College, Dublin, Leasing and Perpetuity Act, 1851.
Covenants of any kind or description whatsoever in
England or Ireland, and charter, disposition, or contract
containing the first original constitution of any ground
annual rights in Scotland (not being a lease or tack for years),
in consideration of an annual sum payable in perpetuity or
for any indefinite period, whether fee farm or other rent, feu
duty, ground annual, or otherwise. The same duties as on
a lease or tack for a term exceeding 100 years, at a yearly
rent equal to such annual sum.

Exemptions.—Any lease or tack for a life or lives not
exceeding three, or for a term of years determinable with
a life or lives not exceeding three, by whomsoever granted;
and any grant in fee simple or in fee tail to the holder
of the fee simple, or to the tenant for life, in pursuance of the Renewable Leasehold Conversion Act,
or in pursuance of the Trinity College (Dublin) Leasing and
Perpetuity Act, 1851; all which said leases or tacks and
grants respectively shall be chargeable with the stamp duties
to which the same were subject and liable before the passing
of the Act 16 & 17 Vict. c. 63.

Every such lease or tack, and every such conveyance,
charter, disposition, or contract as aforesaid hereby charged
with duty, and any conveyance or counterpart hereon ex-
clusively, shall be chargeable with the respective stamp duties
granted and made payable under the several heads or titles of
"Duplicator or Counterpart," and "Progressive Duty," in
the schedule annexed to the 13 & 14 Vict. c. 97.

License to demise copyhold lands, tenements, or her-
editaments, or the memorandum thereof if granted out of
court, and the copy of court roll of any such licence if
granted in court.

Where the clear yearly value of the estate to be demised
shall be expressed in such licence and shall not exceed
75L. The same duty as on a lease at a yearly rent
equal to such yearly value, under the Act of the 13
& 14 Vict. c. 97.

And in all other cases.

STANDARD MEASURE, WEIGHT, &c. The imperial
standard yard, and standard pound Troy having been de-
arroyed in the fire at the Houses of Parliament in 1834, and doubts moreover existing as to the accuracy of the methods which had been provided by the act 5 Geo. IV. c. 74, for ascertaining the standard, scientific men have con-
structed a new standard yard and pound, which have been reconstituted in England and America. The star, which had been deposited in various places, now constitute the standard of measure and weight of the United Kingdom; 18 & 19 Vict. c. 72.  

STANLEY, REV. EDWARD, D.D., Bishop of Norwich, was born in London on the 1st of January 1779. He was the second son and seventh child of Sir John Thomas Stanley, Bart., of Alderley Park, Cheshire, by Mary, daughter and heiress of Hugh Owen, Esq. of Penshaw in Anglesia. His father had been an officer in the army for some years after his death, was raised to the peerage in 1839 by the title of Baron Stanley of Alderley. In his boyhood the future bishop had a passion for the sea and he would have preferred the navy to any other profession. Being destined for the Church however he was sent, in 1798, after a desultory education at various schools, to St. John's College, Cambridge; and here in 1802, he graduated B.A. and was 16th Wrangler of his year. He took the degree of M.A. in 1806. In that year,—having meanwhile travelled on the Continent and having had for some time the curacy of Wendlesham, in Surrey,—he was presented by his father to the family living of Alderley. In 1810 he married Catherine, eldest daughter of the Rev. Osward Leycester, rector of Stoke-upon-Trent, Shropshire. He was then 31 years of age. In 1814 he was installed in the see of Chester for the 18 years (1805-37) during which he discharged his duties in a manner so conscientious and so thorough as to gain the affection of all his parishioners in an unusual degree. He worked assiduously among the population of his parish—wholesome, moral, and industrious. He, perhaps less slight interest in matters of purely theological controversy that inclined him at this time to the quiet pursuit of natural history. Using the opportunities afforded him by his position as the clergyman of a rural parish, he gratified his tastes in this direction by becoming acquainted with the geology, the mineralogy, the botany, the entomology, and the ornithology of his parish. He became a contributor on topics of natural history, and on kindred topics, to 'Blackwood's Magazine' and other periodicals. In 1816 he published 'Blackwood,' entitled 'An Adventure on the Alps in the Mauvais Pas' is supposed to have suggested to Scott the opening scene in his 'Anne of Geierstein.' The department of the Roman Catholic Church he privately cultivated was ornithology; and in 1833 he published under the auspices of the Society for Promoting Christian Knowledge, his well-known work in two volumes entitled 'A Familiar History of Birds, their Nature, Habits, and Instincts.' He had already lectured on subjects of natural history to one or two Mechanics' Institutions in the north of England, and in 1836 he was Vice-President of the British Association. He was also a Fellow of the Royal Society and President of the Linnean Society. Though never obturating his politics on his parishioners, he took part on the liberal side on some of the questions of the day relating to the Church. In 1823 he had published 'A Few Words in favour of our Roman Catholic Brethren,' advocating Roman Catholic Emancipation. In 1835 he published 'A Few Notes on Religion and Education in Ireland.' The spirit shown in these pamphlets, taken along with his excellent character, and his family-connections, rendered it difficult for W his government to find a man for a vacant bishopric; and when at length the vacancy of the see of Norwich by the death of Bishop Bathurst in 1837, Lord Melbourne offered the bishopric to Dr. Stanley. It was with much reluctance that he quitted the parish where he had lived so long to purvey to the interests of the see of Norwich. He was created a baronet by the appointment of Clerk of the Closet of the Chapel Royal. Having accepted the office, however, he set himself with great zeal and punctuality to its duties. Seldom has there been a more hardworking

bisher, or one more sanguine in all schemes of improvement. He abandoned his pursuit of natural history and devoted himself exclusively to diocesan business. At the present bishop had lived to the age of ninety-three, there would necessarily great abuses in the diocese—abuses of none would be greater than the tendency to reform with a boldness, which, though successful in the end, aroused much bad feeling against him. As in the House of Lords and elsewhere, where public questions were discussed, he always took what was called The Liberal side, and he was adherent of latitudinarianism. In the severe deviation from any of the standards of the Church the charge was untrue; and nothing but the tolerance of his disputations in all non-essential matters gave any colour to it. Beloved by all the people, he was highly esteemed by the reputation of being one of the most kindly, sanguine, and hospitable men in the Church, he lived till 1849, when he died unexpectedly on the 6th of September at Brahan Castle in Ross-shire, Scotland, where he was then on a visit. He left five children—three sons and two daughters. His eldest son, Owen STANLEY, entered the navy, where he rose to the rank of captain. He was a man of very considerable scientific attainments, and was regarded as an officer of unusual promise. He had been engaged on various voyages on the coast of Australia, which he had just completed, when he died somewhat suddenly in 1849, his death being apparently hastened by the labours of the survey. Bishop Stanley's youngest son, Charles Edward, is in the Royal Engineers, and was created a baronet in 1899. He is Regius Professor of Ecclesiastical History at Oxford, and the foregoing particulars have been derived from a memoir prefixed by him to a collection of his father's "Addresses and Charges" published in 1861. Of the bishop's writings his History of the Church of England is perhaps the most important through several editions. Among his various pamphlets and sermons may be noted his 'Heads for the Arrangement of Local Information in every Department of Parochial and Rural Interest,' published in 1860.

STANNARY COURTS. The jurisdiction of the Stannary Courts has been extended, and their procedure amended and improved by the statute 18 & 19 Vict. c. 33.

STARCH. [Timus, Organic, s. l.]

STAYNTON OF FRAS. The importunities of this state have been extended by the Mercantile Law Amendment Act, 1856, and the law as to guarantees considerably improved. The alterations thus effected are, however, so entirely technical that the reader can only be referred to them.

STATUTE OF LIMITATIONS. The Mercantile Law Amendment Act, 1856, has removed some of the anomalies which have arisen upon these statutes, but any explanation of the statutes of limitation in the narrower sense, is beyond the scope of this work, as it reaches little beyond the limits of their application in its nature, and require too much space to be given here. It may be enough to state, that the general effect of all the enactments of the statute is to remove certain nice legal distinctions and difficulties, which formerly in many cases served only to confound the simplicity of antient law.

STEFFENS, Heinrich, was born at Stavanger in Norway on May 2, 1773. His parents removed in 1779 to Helingör, where he received his early education, and in 1787 he was taken to Copenhagen, as his early-discovered piety and eloquence seemed to point out divinity as his proper study, though he had already acquired a great fondness for natural history. In 1790 he was entered at the University of Copenhagen, where he so distinguished himself that he was at once placed in Schelling's class. On the 1st of July of that year at Bergen in Norway, and in the autumn while proceeding to Germany he suffered shipwreck at the mouth of the Elbe, saving only his life, and that with difficulty. After residing about a year in the country, he returned to Knip, where in 1796 he gave lectures in natural history, and acted as private tutor. He however felt a want of a fundamental principle in natural science, and, repairing to Jena, imagined that he found in the theories of Schelling what he needed. He was a disciple of Schelling's, and at an early age was initiated into the secret principles of the natural philosophy, and became one of the warmest supporters of the doctrines of Schelling's school (then in its most flourishing state), at least so far as they were restricted to natural philosophy. He preferred the philosophy of the professor of philosophy in the University of Jena, he repaired to Freiberg, where he was instructed by and acquired the friendship of Werner. While here he wrote his 'Geog-

Geognostische-Geologische Aufsätze' (Geognostic-Geological
Essays), not published till 1810, which he expanded in 1811-19 into three volumes of a 'Handbuch der Oryktognosie.' On returning to Denmark in 1808, he excited considerable attention by his lectures; but as he experienced some coldness from influential persons, he accepted in 1804 a call from the University of Copenhagen to the professorship, which he there published (in 1806) his 'Grundzüge der philosophischen Naturwissenschaft.' ('Fundamental Features of Philosophical Natural Science'). The years 1807-9 he spent with his friends in Holstein. He returned to Halle, and took an extreme part, not unattended with danger, in the secret preparations of the Prussian patriots to cast off the French yoke, which they felt to be alike burdensome and disgraceful. When the time for action arrived, Steffens joined the revolutionaries, but was overtaken by Staatsische arreßes and supported the energy of his comrades, with whom he continued till the entry into Paris in 1813. After this he returned to Breslau, where he had been created professor of physics and of natural history. These offices he held till 1821, when he removed in a similar capacity to the University of Berlin, in which city he died on February 13, 1845. While in Breslau he wrote, in connection with what may be called his professional pursuits, huge volumes which he never thought to elucidate on philosophical principles the existence of mankind in connection with the universe. This subject he continued in his 'Polemische Blätter zur Beförderung der spekulative Physik' (Polemical Leaves for the advancement of Speculative Physics), in the year 1835; but these works rather represent the philosophy of the Schelling school than add to our knowledge by any new facts. The intellectual activity and mental riches of Steffens however, at an age when a number of contemporaries were hailed and frequently and successfully appealed to the present thoughts and feelings of his fellow-countrymen. To this description of works belong his essay 'Ueber die Idee der Universitäten' ('On the Ideas of the Universities'), in 1805; his 'Die gegenwärtige Lage unseres Religionswesens,' in 1835; and 'Die geheime Verbindung auf Universitäten' ('On the secret Societies of the Universities'), in 1835. His distincation afterwards at Berlin and afterwards at Kiel was at first the leader of a considerable number of dissenters from that union, and at length involved him in many controversies, which ultimately occasioned the publication of his work 'Von der falschen Theologie und dem wahren Glauben' ('On the False Theology and the True Faith'), in 1824, of which more than one edition has been called for. In 1831 he published 'Wie ich wieder Luthernar wurde und war mir das Lutherthum ist' ('How I became again a Lutheran, and what Lutheranism is to me'), which is a personal and fascinating account of his change of faith, and one of the finest examples of the personality of the Deity. In 1837 also he struck into a new line: he began a series of novels, of which the first 'Die Familien Walseß und Leith,' in three volumes, was followed in 1838 by 'Die vier Norwegern,' in six volumes, and that by 'Malcolm' in two. These novels contain many references to himself both in the incidents and opinions, but they also contain well-defined pictures of the peculiarities of national character, narratives of the historical events of the period, and a sentiment which makes them especially that of his native country in 'The Four Norwegians,' and all are penetrated with a deep-lying religious feeling, which give them a peculiar character. In the last years of his life he occupied himself with writing a detailed autobiography. 'Was ich erlebte,' published in ten volumes, from 1840 to 1845. It is perhaps too minute, but contains many interesting facts, and a fragment of it has been translated into English under the title of 'Adventures on the Road,' and published in 1841. He died at Berlin in 1845. His works are still read and valued, and his views are often referred to in the discussions of natural history, and was the author of a continuation of Shaw's 'Zoology' comprising an account of the Birds, published in 1837. He was a fellow of the Linnean Society, and president of the Entomological Society. He died at the age of 80 in 1849 from a fever, a few days' illness, of inflammation of the lungs.

STEPHENSON, GEORGE, the inventor of the locomotive steam-engine, was the son of Robert Stephenson and Isabella, daughter of Mabel Catesby. He was born at Wath in 1781, and at an early age acquired a great talent for mechanical work. In 1809 he commenced at an early age to be employed about the colliery, during which time he displayed a great affection for birds and animals, particularly rabbits, of which he acquired the reputation of having a fine heard, and from these sources of information, through e.g. sound foundation of good principles and morals had been laid, and at eighteen, whilst employed for twelve hours a day in his labours, and earning only twelve shillings a week, George Stephenson commenced a complete culture. He attended a small school at Whalbottle, where in a year he learnt to read, and to write his own name, for which instruction he paid threepence a week. He next, in 1799, placed himself under a Scotchman named Robertson, at Newburn, and there acquired a perfect knowledge of metric, which he acquired with remarkable facility. At twenty he had been advanced to the superior office of brakesman, with increased wages, to which he added, in his leisure hours, by learning to make and mend shoes. At that time he was a big, raw-boned fellow, full of energy and activity at the village feasts, but remarkable for his temperance, sobriety, industry, and good-temper, yet on one occasion he fought a bully who would have oppressed him, and his wife's plea for his protection secured him ever after from a repetition of the offence. When by the most rigid economy Stephenson had saved sufficient money to furnish a small home, he determined to settle, and on the 26th of November 1808 he married Fanny Henderson, who subsequently removed with him to Newcastle, where he had been appointed brakesman to the engine employed for lifting the ballast brought by the return collier ships to Newcaste. In his new abode at the Ballast Hills, he continued to occupy himself with mechanical experiments, depending
much time and great ingenuity in a fruitless effort to obtain perpetual motion; until an accident having obliged him to repair his own clock, he became the general clock-cleaner and clock-repairer of the town; and the fruit of this mechanical skill whilst adding to his income. On the 16th of December 1803 his only child Robert was born, and soon after he removed to Killingworth, where his wife died. In 1815 Mr. Stephenson had the opportunity of obtaining a share in the Lloyd's engine, one of the famous Boulton & Watt's engines at Montrose; but after continuing there a year—during which time he saved about $25, a considerable sum in his circumstances, and during a period of war-provisions—he returned to Killingworth to find his debts at the expense of more than half his savings, and sold his premises, having been insolvent, and sealed and blinded by a discharge of steam, let in upon him while repairing an engine. Stephenson paid his father's debts at the expense of more than half his savings, and sold his premises, having been insolvent, and sealed and blinded by a discharge of steam, let in upon him while repairing an engine.

The construction of railroads had for some time occupied much of the public attention. In 1829 the owners of the Colliery, desiring to turn their tramroad into a railway, employed Mr. Stephenson in its construction. The length was about eight miles, and being over a hilly country, he took advantage of the heights to form self-acting inclines, the maximum being about 1 in 20. In January 1830 the road was opened for traffic. The proprietors had agreed, on his recommendation, to make the line as a railroad and not as a tramroad, with stationary engines for the steep gradients, but horse-power was to be used for the levels, for Mr. Stephenson's confident anticipations of an easy working of the engine were not altogether realized. He began the work in May 1829, but in 1832 an amendment to the Bill for the line with locomotives, which Mr. Stephenson was appointed resident engineer for the line, was struck out per annum, and upon that appointment he removed to Killingworth. In September, 1835, and an engine driven by Mr. Stephenson himself drew a load of ninety tons at the rate of upwards of eight miles an hour. It proved highly remunerative, for besides a far larger amount of goods traffic than had been calculated for an Act. A strong opposition was raised both within the House of Commons and without. Landowners drove the
engineers off their grounds, and before the Committee the most absurd objections were urged against the whole scheme, the idea of any quick transit being a subject for especial ridicule. The Bill was however carried on a second application, and Mr. Stephenson prevailed upon the Directors to offer a prize for a locomotive engine, conforming to certain conditions, which was done, and the prize was won by the Rocket engine, in the construction of which he had assisted himself of the assistance of his son Robert.

From this moment his fortune was made. Employment of a most remunerative character poured in from all sides. Railways were projected in every direction, and he became the chief engineer of several of them. With these he was incessantly engaged till 1840, when he resigned most of them, and settled at Tipton in Derbyshire, where he commenced a fresh pursuit in working the Clay Cross colliers. At this time he took much interest in the well-doing of the Mechanics' Institutes in his neighbourhood, and on more than one occasion related to them the circumstances of his own career, as an encouragement to the members to adopt a course of study, and to avail themselves of the opportunities in their way. His extension however continued unabated, and he took an active part, either as engineer, chairman, or shareholder, in the Whitehaven and Maryport, the Yarmouth and Norwich, and the Newcastie and Edinburgh East Coast Line, with whom his farm and gardens, and indulged in his old fancy for keeping birds and animals. With the exception of promoting the Ambagrate and Manchester Railway, inventing a new self-acting break, of attending the ceremony of opening the Trent Valley Railway (when Sir Robert Peel made a speech complimentary to him), and of being considerably troubled by applications for assistance and advice from projectionists and inventors of all kinds, to whom however he was invariably attentive and kind, he passed the remainder of his days in pleasant retirement. The invention of the steam-engine excited great interest in the Institution of Mechanical Engineers of Birmingham, which he had founded, and was President of. He died after a short illness on August 12, 1848, leaving a name rendered illustrious by the patient perseverance of a high and virtuous mind and the contemplation of a remarkable genius. A valuable biography of this eminent man has been written by Mr. S. Smiles, to which we are indebted for many of the facts in this notice.

Stereoscope, from στερεός (solid) and σύνε (a view, or σύνεντυς to view), an instrument by which two pictures of any object, taken from different points of view, are seen as a single picture of that object, having the natural appearance of relief and solidity.

To see with two eyes, that only a single representation of the object is presented to the mind, must of course have very early forced itself on the consideration of men of attentive and reflective habits. And it could not fail to be observed that the appearance which an object-stated one point as from the position, and with only one eye, is different from that which it presents if it be then looked at, without changing the position or moving the head, by the other eye alone. Accordingly we find in scoliony a closer identification between the actions of the natural philosophy, references more or less full and direct to the subject, and speculations as to the cause. Euclidian showed by means of a sphere that each eye sees a dissimilar representation of an object; and Galen some centuries later explained the matter, by saying that the similar pictures are not seen at the same instant but successively, and that these rapidly succeeding pictures produce on the mind the impression which is conceived of as relief. At the end of the 18th century, Leonardo da Vinci, and in the 18th and following centuries, Baptista Porta and Agnionius wrote on the subject of vision as produced by dissimilar pictures seen by each eye; but down to our own time natural philosophers have been almost universally content to accept the opinion that each eye sees an object at a time. The whole question of vision by one and by two eyes, of monocular and binocular vision, was re-opened by Mr. Wheatstone,—to whom the world is indebted for the application of electricity to telegraphic purposes,—in a paper entitled ' Contributions to the Phenomena of Binocular Vision.' Remarkable and hitherto Unobserved Phenomena of Binocular Vision,' read before the Royal Society, June 21st, 1838, and again, before the British Association at Newcastle, in October, 1839. The following letter was printed in the 'Philosophical Transactions' a few months later.

In this paper Mr. Wheatstone argued that the appearance of relief and solidity which we obtain in looking at objects in nature, arises from there being a dissimilar picture of the object projected simultaneously on the retina of each eye, the optic axes of which are not parallel; whereas in viewing a pictorial representation two similar pictures are projected on the retina, and hence the resultant flatness. It is not necessary to enter further upon his views, nor upon the theory of vision generally, as the subject has been treated of fully under the head Stereoscopic, vol. xxi., p. 404-6.

Mr. Wheatstone sought to elucidate and confirm his theory by an ingenious instrument which he exhibited when he read his paper, which he called the Reflecting Stereoscope. This instrument, now known as the Reflecting Stereoscope, consists of two plane mirrors, fixed with their backs to each other at an angle of 90 degrees. These mirrors (or polished glass prisms) are supported on a central stand, which is fixed in a mahogany case. When the two mirrors are turned to the plane of the paper, they support the two pictures (which have been taken from dissimilar points of view) in the same horizontal line, parallel to each other and at equal distances, one on each side of the mirrors. The observer by his eyes as close as he can to the mirrors, the angle of which must coincide with the middle line of his face and forehead, the two dissimilar pictures united, so as to give the appearance of the object represented, not as it is seen depinned on a plane surface, but with all the solidity of the object itself. The reflecting stereoscope excited great interest among scientific men when first exhibited, but the pictures prepared for it were almost exclusively dissimilar outlines of various geometrical solids—photography not being then in existence; and by those who did not employ it for a purely scientific purpose it soon came to be regarded as merely an ingenious and somewhat curious as well as expensive optical toy. For most purposes it has been superseded by the more conversational and more popular form of the instrument, known as the Lenticular Stereoscope, among others of that exhibiting photographs of any size.

For the Reflecting Stereoscope we are indebted to the inventor of another very beautiful contrivance, the Kaleidoscope [Kaleidoscope, S. 1, p. 123]. Sir David Brewster having taken certain photographs, by photographing these, he prosecuted an elaborate series of experiments with a view to the establishment of what he regarded as the more correct theory of binocular vision; and some of these experiments led him to construct the instrument which, in the form it ultimately assumed, he called the Lenticular Stereoscope. He early exhibited his instrument in his classes at St. Andrew's, but he first fully explained his views on binocular vision, and made public his invention, in a paper 'On the Law of Visible Position in the Representation of Solid Figures by the union of Dissimilar Plane Figures on the Retina,' which he communicated to the Royal Society of Edinburgh in January 1843. He further explained and illustrated his views in many subsequent papers, which, like the forms, were published in the Edinburgh Transactions of that and following years. Of these very valuable contributions to the science of optics it is unnecessary to speak further here, and into the controversy which followed among philosophers and the leaders of popular theories of binocular vision, and their respective claims as the inventors of the stereoscope, we shall not enter: the opinions of Sir David Brewster, in their matured and digested form, will be found amply set forth in his work 'The Stereoscope,' (1853), and in a subsequent paper, reprinted in the paper already referred to, and in another which formed the Bakerian Lecture of the Royal Society for 1856, being 'Part II. of Contributions to the Physiology of Vision, and on Binocular Vision.'
The Lenticular Stereoscope of Sir David Brewster, as described by himself, "consists of a pyramidal box of wood or metal, or any other opaque material, blackened on the inside, and having a lid for the admission of light when the picture is to be viewed. The box is opened, and the light pass through the pictures when they are transparent. Another lid is sometimes added, so as to open externally on the bottom of the box, for the purpose of exhibiting dissolving views in the stereoscope. The bottom of the box is generally blackened, and little vessels, or other receptacles, may be obtained for containing a semi-lens or quarter-lens. These two portions may be advantageously made to approach or recede, in order to suit eyes at different distances from one another; and the tubes containing the lenses should draw out, in order to suit long and short-sighted eyes." The two dissimilar pictures (which for convenience are mounted on a thick card, forming the universally known "slide") are placed in a groove in the bottom of the box, when, on looking through the eye-tubes, they are seen united into a single picture, and the object or objects, if a proper amount of light is obtained, stand out with an almost magical appearance of relief and solidity. The employment of photography for the stereoscope has wonderfully extended the range of the instrument, and now, what has been already explained to you, taken the philosopher as an extremely ingenious piece of scientific apparatus, or have found a somewhat larger though less important circle of admirers as an elegant toy, has become one of the most widely known and universally popular means of social amusement, rightly used, an extremely valuable means of instruction.

In describing the instrument, it was said that each of the eye-pieces contained a semi-lens. It is by means of these semi-lenses that the stereoscopic effect is produced, though they do not themselves produce that effect. What they accomplish is the transference of the two dissimilar pictures or stereographs to a middle point. The union of these two pictures in their superposition on that middle point, produces the stereoscopic effect. The two semi-lenses are the two halves of a convex lens, so placed that the edge or thin part of each is turned inwards—the opposite direction that is, to that which it held in its original position. How this act may be understood by a very simple experiment. In any small object as a coin or medal be laid on a piece of white paper and looked at with the right eye only, through a convex lens, the right half of which is covered by an opaque square, the coin will be seen some distance on the left of its true position, but the left half of the coin will be held close to the lens, and the proper focal distance be chosen. On turning the lens so that the left half is covered, and looking through the uncovered half with the left eye only, the coin will be seen some distance on the right side of its true position. Just so the half lenses in the eye-pieces of the stereoscope—which are placed 2½ inches apart, corresponding to the distance between the eyes—make the two pictures in the mind to approach and become superimposed on each other. But as the pictures are strictly dissimilar, having been taken from points of view correspondent to those of the right and the left eye respectively—and as, consequently, that portion of the right side of all solid objects which the right eye sees is represented in the picture on the right side, and that portion of the left side which the left eye sees, in the other, as well as the front which is common to both eyes, it follows that when these pictures are superimposed, the resultant single picture includes all that each eye sees, and therefore has all the apparent roundness, solidity, and relief which the original presented when looked at both eyes: an effect aided it must be confessed by the isolation of the pictures in the chamber of the stereoscope. Various modifications have been arrived at—namely, an employment of larger lenses, the changing its frame from a pyramid to another oblique form, &c.—but the principle is the same in all, and some of the changes are certainly not improvements.

What has been said, an attentive reader will have no doubt drawn the inference that the production of a stereoscopic picture must depend mainly on the character of the dissimilar pictures or stereographs. This is most certainly the case, though too often overlooked or insufficiently regarded by those who take stereoscopic pictures. Stereoscopic portraits are usually taken with cameras contrived for the purpose. In order to take stereographs of landscapes, buildings, statuary, &c., the ordinary landscape camera is employed; the camera being removed, after the first picture is taken, to a position parallel to that just occupied by the camera of the first picture, either more or less distant from the first point in proportion to the distance from the object to be represented. The stereoscopic angle, as it is called, has been laid down by high authority at 1 in 25 for objects 50 feet or more distant, some writers having thought that the angle might be increased to a distance of 4 feet, in order to take views of an object only 20 feet distant. But the effect of such an arrangement is obviously to make one picture represent much more of the object than falls within the field of vision, than could be seen by a person standing, say midway, between the two positions. And the two pictures thus taken were, when united in the stereoscope, present an exaggerated and therefore untrue representation. In fact there will be, what is so commonly seen in the stereoscope, an unnatural appearance of separation between the chief object and the accessories. You see round the figure in fact, just as in life you see round a statuette or small model, and hence there arises that detached model-like appearance which is often and very properly, objected to stereoscopic representations. What the stereoscope ought to show is, the representation of an object or objects in nearly the same relative solidity, relief, and separation as they would appear to a person standing midway between the two positions. But to exhibit if the stereographs were taken, as they ought to be, and as the most successful (though not the most popular) are taken, from positions little if at all exceeding that of the eyes apart. The great importance is to view the objects of the ordinary traveller, of antiquities, objects of special scientific interest, &c., will be at once acknowledged; and the value of the stereoscope for affording such representations in their greatest attainable perfection is daily becoming more and more apparent. It will be enough to allude, as illustrating this, to the recently published views in Egypt, in which the antiquities and the scenery of that country are almost literally brought home to those who cannot go to them; and to the very remarkable series of stereographs of the Peak of Teneriffe, published by Mr. Piazza Smyth, in his recent work, 'Teneriffe, an Astronomer's Experiment,' which gives us almost the very cone itself, in some of its most striking and characteristic phases, to gaze upon and to study.

STERLING, JOHN, was born at Kaimes Castle, in the island of Bute, Scotland, on the 20th of July 1806. Both his parents were Irish by birth, though of Scotch descent; and his father, Edward Sterling (afterwards well known as a cavalry officer, and a prominent advocate of the Emancipation Bill) then pursuing the occupation of a gentleman-farmer, after having been educated for the Irish bar, and having served for some time as a captain in the army) had rented Kaimes Castle. John was the second son of the family; the second child of seven, five of whom died while he was still a youth, leaving only himself and an elder brother. In 1809, the family removed to Llanlethen, in Glamorganshire, Wales; and here John Sterling received his first school education. His father about this time began to contribute to the 'Times' as an occasional correspondent; and the interest he thus took in politics, led him, on the peace of 1814, to remove again with his family to England. His son John, from Pimperne in Somerset, and from Elba, and the resumption of the war, the family in 1815 settled in London, where gradually the father rose to his eminent position in the world of politics and journalism. He was destined to outlive his son.

After having been at various schools in or near London, Sterling was sent to the University of Glasgow; whence, after a brief stay, he was removed in 1824 to Trinity College, Cambridge. Here Julius Harris, afterwards Archdeacon of Lewes, was his tutor, and here he formed the acquaintance of the great Ridgley, Smollett, Canning, and others. After graduating, he was called to the bar; and in 1827 he was elected to one of the seats in the House of Commons, representing the county of York. In 1830, he was appointed to the office of Solicitor to the Board of Admiralty, and it was here perhaps that he first exhibited the qualities of intellect and character which made him afterwards socially celebrated. From Trinity College, Sterling removed, also with his friend Maurice, to Trinity Hall, with an afterwards of studying law; but in 1827 he left Cambridge altogether.
without taking his degree. In 1889 the 'Athensmum,' then recently started by Mr. Silk Buckingham, was purchased by Sterling, or at his instance, and he and Maurice conducted it and wrote in it for some time. The speculation however in their hands did not answer commercially, and the journal was soon reconstituted by others. It was not absolutely necessary that he should engage in any employment for his living, continued to reside in London, the centre of a circle of ardent and thoughtful young men, including not only his college friends, but such additions as John Sterling himself had made. In 1844, he published 'Liberum Vivere,' the characteristic.

It was about the year 1828 that he first became acquainted with Coleridge, then living his recluse life at Highgate; and Coleridge's influence on Sterling was great, and made its mark on him for the rest of his life. A collection of his 'Essays and Tales' from the 'Athensmum,' 'Blackwood,' and other periodicals, was edited in two volumes, with a memoir prefixed, by Archdeacon Hare, in 1843; the well-known 'Life of Sterling' by Mr. Carlyle, representing the man less in detail than in his general human relations, appeared in 1851; and in the same year 'Twelve Letters by John Sterling' were edited by his relative Mr. Coningham of Brighton.

STEVENBERGTE. [MINERALOGY, S. 1.]

STEVENSON, ROBERT, the celebrated engineer of the Bell Rock Lighthouse, was born at Glasgow on June 8, 1772. His education was conducted under the care of his mother (his father having died when he was young), and when complete he was placed under Mr. Theodorus Rothe, who had projected the mode of improving the illumination of lighthouses by the substitution of oil lamps with parabolic mirrors for the open coal-fires. When that gentleman was removed to the Northern Lighthouse Commissioners, Stevenson became his assistant; and when only nineteen had the superintendence of the construction of the lighthouse on the island of Little Cumbrae, in the Frith of Clyde, between the southern point of the Isle of Bute and the Ardrossan Harbours. In 1794, a few miles off Arbroath in Forfarshire, having which the light was exhibited for the first time on Feb. 1, 1811. The rock being extremely small, and almost entirely covered, even at low-water, except in spring-tides, offered great obstacles to the construction, but they were successively overcome, and an account of the details of the erection and structure, illustrated with plates, was published at Edinburgh in 1824. A controversy has arisen as to the originality of Mr. Stevenson's plans, into which we cannot enter, but it is certain that he himself from the very beginning always endeavored to secure a firm and enduring foundation, and this was undoubtedly done by Mr. Stevenson. In 1814, on another tour of inspection, Sir Walter Scott was a companion of the engineer and commissioners in the voyage, which afforded many materials for descriptions in Scott's poem of the 'Lord of the Isles,' and in the novel of 'The Pirate.' Mr. Stevenson held the situation of engineer till 1842, during which time he erected no fewer than 23 lighthouses. He was also employed in numerous engineering works in various parts of the United Kingdom, but chiefly in Scotland, in connection with the improvement of rivers and harbours, and the erection of piers and bridges, into which latter class of works he introduced some new principles of construction. Will he be long remembered as the inventor of the 'long swing' lines of ropes used in Edinburgh and Glasgow, which, though not adopted, was admitted to be extremely clever. He was employed to report on other lines of railway, and he suggested the use of malleable iron rails instead of the cast-iron rails then in use. In 1826 he became a member of the Institution of Civil Engineers, and while he lived was looked upon as an authority of great weight on all questions connected with the improvements of ports, harbours, and rivers. He died on the 16th of June, 1854. The Bell Rock and Lighthouses passed a resolution acknowledging his great services and merits. He left sons, whom he had brought up to his own profession, who worthy sustain the reputation of their father.
STOCKS. [MATTHIA].

STOCKS, JOHN E., M.D., was born in 1822. He was educated for the medical profession at University College, London, and in 1843, returned to India, especially attached himself to the study of botany. He obtained an appointment in the East India Company's service, and soon distinguished himself for his acquaintance with plants. He was sent to Sind and Beluchistan to report on the cultivation and natural history of the country, and on specimens and information. He came back to England about the year 1854, intending to work up his numerous materials for publication. His health however failed him, and after having deposited his collections at Kew, he retired to Dillingham, near Lymington, Hampshire, in 1865.

STOCKTON. [CALIFORNIA, S. 2].

STOODART, SIR JOHN, KNIGHT, was born in 1773 in the parish of St. James's, Westminster, but his father, who was a lieutenant in the navy, residing in Wilthare, he received his early education in the grammar-school at Salisbury under Dr. Skinner. His proficiency in Greek at this school occasioned his being sent to the University of Oxford, where he was elected at Christ Church College in 1790, and graduated as B.A. in 1794. He at first studied divinity, but feeling an inclination for the law he proceeded B.C.L. in 1798, and D.C.L. in 1801. In the meantime he had not neglected general literature, and in 1796 and 1798 he had published two dissertations on the Benedictine pronunciation of the Greek, and on the German pronunciation of 'Der', in connexion with Dr. S. Worms, to which only their initials appeared on the title-page. At this period he took a favourable view of the French revolution, and in 1797 published a translation from the French, entitled, 'The Views and the Principles of the Executive Directory of France, with the Lives of the present Members.' In 1801 he admitted a member of the College of Advocates, and published Remarks on Local Scenery and Manners in Scotland, during the years 1797 and 1800. In 1806, on the recommendation of Sir William Scott, he was appointed King's advocate and admiralty advocate in Malta, in which situation he remained nearly four years, when he returned to England, and was appointed a judge of the Court of Directors. In 1810 he commenced writing upon political subjects in the Times newspaper, his contributions being marked J. S., and this led to his becoming the political editor in 1812. His writings in this paper were distinguished by great energy, the possession of much varied knowledge, a clear style, with a power of felicity, too often found on more prejudice, that occasioned his receiving the sobriquet of Dr. Slop, and as such he was besieged by George Cruikshank to illustrate the caricatures published by Hose. Dr. Stoddart is said to have taken a lively interest in the publication of his political editorials. He held this important post till the close of 1816, when, in consequence, it is said, of the disapproval of the proprietors of the continued violence of his attacks on the now imprisoned emperors, his connection with the 'Times' was dissolved, and in 1817 he started an opposition paper called The New Times. It was unsuccessful, and in a short time he left it, retired to private life, and to his practice as an advocate. In 1826 he was appointed chief-justice and judge of the Court of Directors of the Port of Malta, being knighted at the same time, and in that office distinguished himself by the able and conscientious manner in which he discharged his duties, until his return to England in 1839. From that time till his death he led a private life, in which he was much and widely esteemed, but occasionally published pamphlets on legal subjects, and took considerable interest in the reform of the law, being one of the earliest members of the Law Amendment Society. He also wrote An Introduction to the Study of the correspondence of the British and the Science of Language, which were printed in the Encyclopædia Metropolitana, but have likewise appeared as separate works. A Statistical, Administrative, and Commercial Chart of the United Kingdom, compiled from parliamentary and other authorities, was one of his last productions. He died at Brompton-square, near London, on February 16, 1856; and on the first meeting of the Law Amendment Society after his death, Lord Brougham pronounced an eulogy on his memory.

STOKESLEY. [ YORKSHIRE].

STONECROP. [Sedum].

STOWE. [Tulip].

STRAHOMIN. [Chemistry, S. 1].

STRANGFORD, PERCY CLINTON SYDNEY SMYTHIE, SIXTH VISOUNT, was born in 1780, and graduated in 1800 at Trinity College, Dublin, obtaining the gold medal for the best performance for the degree of Bachelor of Arts, and the diploma of the University. He was early attached to the study of botany. He obtained an appointment in the East India Company's service, and soon distinguished himself for his acquaintance with plants. He was sent to Sind and Beluchistan to report on the cultivation and natural history of the country, and on specimens and information. He came back to England about the year 1854, intending to work up his numerous materials for publication. His health however failed him, and after having deposited his collections at Kew, he retired to Dillingham, near Lymington, Hampshire, in 1865.

STOCKTON. [CALIFORNIA, S. 2].

STOODART, SIR JOHN, KNIGHT, was born in 1773 in the parish of St. James's, Westminster, but his father, who was a lieutenant in the navy, residing in Wilthare, he received his early education in the grammar-school at Salisbury under Dr. Skinner. His proficiency in Greek at this school occasioned his being sent to the University of Oxford, where he was entered at Christ Church College in 1790, and graduated as B.A. in 1794. He at first studied divinity, but feeling an inclination for the law he proceeded B.C.L. in 1798, and D.C.L. in 1801. In the meantime he had not neglected general literature, and in 1796 and 1798 he had published two dissertations on the Benedictine pronunciation of the Greek, and on the German pronunciation of 'Der', in connexion with Dr. S. Worms, to which only their initials appeared on the title-page. At this period he took a favourable view of the French revolution, and in 1797 published a translation from the French, entitled, 'The Views and the Principles of the Executive Directory of France, with the Lives of the present Members.' In 1801 he admitted a member of the College of Advocates, and published Remarks on Local Scenery and Manners in Scotland, during the years 1797 and 1800. In 1806, on the recommendation of Sir William Scott, he was appointed King's advocate and admiralty advocate in Malta, in which situation he remained nearly four years, when he returned to England, and was appointed a judge of the Court of Directors. In 1810 he commenced writing upon political subjects in the Times newspaper, his contributions being marked J. S., and this led to his becoming the political editor in 1812. His writings in this paper were distinguished by great energy, the possession of much varied knowledge, a clear style, with a power of felicity, too often found on more prejudice, that occasioned his receiving the sobriquet of Dr. Slop, and as such he was besieged by George Cruikshank to illustrate the caricatures published by Hose. Dr. Stoddart is said to have taken a lively interest in the publication of his political editorials. He held this important post till the close of 1816, when, in consequence, it is said, of the disapproval of the proprietors of the continued violence of his attacks on the now imprisoned emperors, his connection with the 'Times' was dissolved, and in 1817 he started an opposition paper called The New Times. It was unsuccessful, and in a short time he left it, retired to private life, and to his practice as an advocate. In 1826 he was appointed chief-justice and judge of the Court of Directors of the Port of Malta, being knighted at the same time, and in that office distinguished himself by the able and conscientious manner in which he discharged his duties, until his return to England in 1839. From that time till his death he led a private life, in which he was much and widely esteemed, but occasionally published pamphlets on legal subjects, and took considerable interest in the reform of the law, being one of the earliest members of the Law Amendment Society. He also wrote 'An Introduction to the Study of the correspondence of the British and the Science of Language, which were printed in the Encyclopædia Metropolitana, but have likewise appeared as separate works. A Statistical, Administrative, and Commercial Chart of the United Kingdom, compiled from parliamentary and other authorities, was one of his last productions. He died at Brompton-square, near London, on February 16, 1856; and on the first meeting of the Law Amendment Society after his death, Lord Brougham pronounced an eulogy on his memory.

STOKE POGES. [BUCKINGHAMSHIRE].

SU T

On the failure of the health of Dr. Buckland, Mr. Strickland was appointed reader in geology in the University of Oxford, and he was immediately set to work on his book. Amongst these the following were published in the 'Proceedings of the Zoological Society.' 'Descriptions of New Species of Birds from West Africa.' 'Notes on a certain species of Sperm whale, and description of the whale.' These were published by him in the 'Annals and Magazine of Natural History,' in Jardine's 'Contributions to Ornithology,' and in other works.

Whilst at Oxford his attention had often been directed to the head and feet of the Dodo, the only existing remains of a bird that had ceased to exist within a comparatively recent period. These remains had occupied the attention of naturalists, and many conjectures had been made as to the exact nature of this bird. Mr. Strickland expended much labour and ingenuity in getting together all the facts that existed with regard to the history and disappearance of this bird [Dana, vol. xx. pp. 47, 55], published a volume on the subject, entitled 'The Dodo and its Kindred,' and produced a series of natural history studies, which are not confined to the subject of extinct Birds,' London, 4to, 1848. This work contained copies from drawings of this bird, and a discussion on its zoological affinities, and the conclusion of the author that it belonged to the family of Columbidae or Dores. In the conclusion of this monograph some new and interesting ideas are introduced. During his life Mr. Strickland was engaged in preparing a large work on the synonymy of the family of birds, one volume of which has been published since his death.

The original list of works in this book was increased by Mr. Strickland at least one third. His own publications, the list of which was published in the fourth volume and after his death, amounted to eighty-six. He was cut off in the midst of his labor of usefulness. He had been attending the meeting of the British Association for the Advancement of Science held in the year 1853 at Hull. He wished to inspect the cuttings of the Gainsborough and Retford Railway, and whilst thus engaged, note-book in hand, he was killed by a common pole, on that line, he was run over by a passenger train, and killed on the spot, Sept. 14, 1853. He was married in 1846 to the second daughter of Sir William Jardine, Bart., but left no children.

STROMATA, the name of an Earth, composed of Oxygen of Iron. This post he held at the time of his death 1853 at Hull. He wished to inspect the cuttings of the Gainsborough and Retford Railway, and whilst thus engaged, note-book in hand, he was killed by a common pole, on that line, he was run over by a passenger train, and killed on the spot, Sept. 14, 1853. He was married in 1846 to the second daughter of Sir William Jardine, Bart., but left no children.

STROMATITE—Carbonate of Stromita—occurs in modified rhombic prisms. It occurs also fibrous and granular, and sometimes in globular shapes with a radiated structure within.

The colour is usually a light tinge of green; also white, gray, and yellowish-brown. Lustre vitreous, or somewhat resinous. Transparent to translucent. Hardness 3 or 4.

Stromitalite—Carbonate of Stromita—occurs in modified rhombic prisms. It occurs also fibrous and granular, and sometimes in globular shapes with a radiated structure within.

The colour is usually a light tinge of green; also white, gray, and yellowish-brown. Lustre vitreous, or somewhat resinous. Transparent to translucent. Hardness 3 or 4.

The analysis of stromita carbonate by Dr. Buckland, and then by means of nitric acid the nitrate is obtained.

The first announcement of the theorem (in the English language) was not made until 1855, when Professor J. R. Young, of Belfast, inserted the substance of Sturm's memoir in his work entitled "The General Theory and Solution of Algebraical Equations," published in that year. The first complete theoretical proof of the theorem was given by Sturm himself; his own work was in great part printed, and disregarding a disparaging comment of Lacroix, he thought the discovery of sufficient importance to justify the destruction of many pages of his manuscript prepared for the printer, and the suspension of all other work for the sake of having his discovery be published. This he received in July, and his own work was published in August. To the appreciation and zeal of this analyst, whose recognition and promotion of the theorem was of such importance, must be attributed the simultaneous, British mathematicians, as well as M. Sturm himself, were greatly indebted. In the preface to his "Mathematical Dissertations" (one of which is devoted to the theorem) dated November 25, 1840,—only five days before the presentation of the Copley medal,—he adverts to Sturm's discovery as at that time exciting considerable interest among analysts, as well in this country as on the continent; and he then expresses his own estimation of it in the following terms: "I believe that I have already contributed somewhat to extend the importance of this important theorem among British analysts; and although it has been since dispersed and undervalued in certain quarters, I have always entertained the conviction that it must eventually supersede every other analytic method for the solution of such equations as a numerical equation." In Professor Young's subsequent introductory volume on "The Analysis and Solution of Cubic and Biquadratic Equations," published at the beginning of 1844, he invited the attention of the young analysts to the following theorem, which he had discovered, as an alternative method to the former work on equations,—entitled "The Theory and Solution of Algebraical Equations of the Higher Orders,"—which appeared early in the following year, is chiefly devoted to the analysis and development of the general method and the previous theories of Budan and Fourier.

In France it was not without some difficulty that the substantial rewards of his scientific achievements were obtained; he was a foreigner, and naturally placed at a disadvantage in a contest with native competitors. It is right to mention, both for the honour of France and as a proof of the very high reputation which Sturm had attained. The subsequent memoirs of Sturm, whether first presented to the academy or not, were chiefly printed in the journal of M. Liouville. Two of these memoirs, relating to the discussion of differential and partial differential equations, such as present themselves so commonly in the solution of the more important problems of mathematical physics, possessed a merit so extraordinary that they were refused two prizes, and declared, at a time when he was himself a competitor with Sturm for a place in the Academy, that "impartial posterity would place them by the side of the finest memoirs of Lacroix".

The first of these two memoirs was presented in 1833 to the concours for the great prize of mathematics, to be awarded by the Academy in 1834 for the most important discovery in that science made known within the preceding three years. The academy conferred the prize on Sturm—not for the memoir which he had submitted to the judgment of the commission, but for that which contained his celebrated theorem and which had been presented in 1829. Other memoirs relate to optics, mechanics, pure analysis, and the application of analytical methods to several questions which have been treated in those several branches of science. One of the latest of these was a communication to the academy on the theory of vision, and is remarkable both for the geometrical and analytical elegance with which many questions subsidiary to the theory are treated in it. It confirms generally,—with one important exception relating to the asserted muscularity of the crystalline lens and the changes attributed to its action,—the views of the late Dr. Young. The importance of this memoir on this subject: Dr. Young himself, it must be remembered, once relinquished his belief in the muscularity of the lens, though he finally renewed it.

Sturm, in his memoir, has been visited by the mathematicians with whom he conversed a high impression, as well as the extent of his knowledge as of his inventive power. The health of M. Sturm, which had previously been remarkably vigorous, began to decline in 1861, probably in
consequence of his laudable public employment's and the unmitting severity of his studies. He died on the 18th of December 1855, to the deep regret of a large circle of friends and pupils, to whom he appears to have been singularly exalted by the modesty, truthfulness, and simplicity of his character.

STURMIA, a genus of plants belonging to the natural order Orchidaceae and the tribe Malabadsineae. It has a patent perianth; lip anterior, erect or oblique, entire, dilated, much longer than the others; sepals in the line of the lip; petals 5, ovate, in the whitish sheaths of the sepaled leaves. If to the Lepidium of some authors. It is found in sappy woods in Norfolk, Suffolk, and Cambridgeshire, but is very rare. (Ibigneb, Manual of British Botany.)

SUCCESSION DUTIES. For many years persons succeeding to personal property (including leases), whether they took by will as executors or legatees, or merely as administrators or next of kin, were charged with Lease Duty on the real estate in the hands or under the control of the predecessor. The exemption of real estate from this species of taxation, long complained of as creating an undue preference in favour of the holders of landed property, has at last been removed. By the Succession Duties Act, 1855, duties are imposed on every succession to property, whether real or personal, according to the value and the relationship of the parties to the predecessor. Where the successor is the lineal issue or lineal ancestor of the predecessor, 1d. per cent.; where a brother or sister, or a descendant of a brother or sister, 3d. per cent.; where a brother or sister of the father or mother, or a descendant of the brother or sister of the father or mother of the predecessor, 6d. per cent.; where a brother or sister of the grandfather or grandmother, or a descendant of the brother or sister of the grandfather or grandmother of the predecessor, 6d. per cent.; and where the successor is in any other degree of collateral consanguinity to the predecessor, or is a stranger in blood to him, 10d. per cent. The value of the succession, if it be real property, is ascertained by considering the interest of the successor as of the value of an annuity equal to the annual value of the property, estimated as the Act directs; and the duty may be paid by eight equal half-yearly installments, or at once, according to the wishes of the party liable thereto.

SUE, the popular romancist, was born at Paris Dec. 10, 1804. His ancestors, who came from Lacolle, near Cannes, in the south of France, settled in the French capital at the beginning of the 18th century, and having acquired some property, were the parents of respectable physicians, two of whom became celebrated, and enjoyed a very extensive practice. Joseph Sue, his grandfather, and Jean-Joseph Sue, his father, are both mentioned with honourable distinction in the national biographies of France. The latter, who had been principal physician to the Hôpital de la Maison Du roi, and anatomical lecturer to the École Royale des Beaux Arts, during the reign of Louis XVI., was one of the household physicians to Napoleon I.; and it was to the scientific and literary circles that the font by the Empress Josephine and his son Eugène Bonnaire, from whom he derives his Christian name.

Dr. Sue, having but two children—a son and a daughter—was too engaged in bringing up a family of the profession, and Eugène in conducting a medical practice at the Collège de France, as well as at the schools of Paris; and, thanks to his father's position and influence, was enabled at the age of twenty to enter a company of the Royal Body Guards as aide-major.

He was soon after transferred to the staff of the French army preparing to enter Spain under the Duke of Angouleme. In this campaign he was present at the siege of Cadiz and at the Tucaderal in 1833. In 1832 he quitted the land for the sea service, visited America, Asia, and the coast of the Mediterranean, in which he excelled, and which gave him that knowledge of ocean scenes and sailor life which he since described with indisputable power in his earlier tales. He was present in 1832 at the battle of Navarino, on board of the frigate Jeanne d'Arc, and was present at the capture of Tripoli at the age of sixty-nine, leaving to his son an unencumbered estate of 40,000 francs (1600L) a year, besides a splendid museum of anatomy, valued at several thousands more, bequeathed to the nation. Eugène Sue, at this time in his twenty-sixth year, was engaged to a young lady, Marie de Beauvais, who, at the time was the only child of a very wealthy family who had acquired so much distinction, and to which he owed his fortune. His taste inclining to art, he became a painter, and in that vocation entered the studio of Gudin. About the same period he was an ardent painter, and this was gratified by the insertion of some slight articles in the journal recently established by Emile de Girardin—"Le Voleur." Encouraged by this success, he began to write tales descriptive of sea adventures, publishing in 1837, 'La Robe Blanche,' and 'La Salamandre.' The two former were rejected by the trade, he therefore published them at his own risk. In 1832 he had already become popular both with publishers and their subscribers. But it would be quite a mistake to suppose that he suddenly became the idol of the nation. At that time he was a man at that time could repudiate it more; wherever he went he was loud in denouncing it. His father's name and his private fortune gave him access to the best company; he selected the highest for his cultivation, and lived among the old families of the Fanboug Saint-Germain.

Sue was one of the first to try his skill in framing those historical romances which the genius of Sir Walter Scott had rendered so universally popular. A new market had been opened for the purchase of books, and similar fiction—"le roman-feuilleton. Thus his 'Lacramont,' his 'Jean Cavalier,' his 'Commande' were published, and devoured from day to day by the public. His name had become a magnetic charm in the estimation of those speculators who had once rejected his manuscript. It was presumed that so popular a name was a guarantee for success in literary enterprises; and acting on this presumption, he was engaged at very high terms, having a reputation for concocting vivid scenes of naval adventure, to write a 'History of the French Navy.' But the speculator in this instance was disappointed: the public bought the first volume on account of the name, and refused to buy all the other volumes on account of the work. From 1832 to 1840, Eugène Sue had confined himself to that class of novel, and his books were generally emulated, if not to rival, Fenimore Cooper in sea adventures, and Sir Walter Scott in historical delineations. But at this period the novels of Balzac in France, and those of Charles Dickens in England, began to be noticed, and to make novel writers take more care of their work, to present a real life, or as the French call it, le Roman de Morue. He therefore resolved to adopt the new style, and to change we owe 'Arthur,' the 'Hôtel Lambert,' and 'Mathilde,' published in 1841 and 1842. Making allowance for those licences in morality which are too frequently found in the current French fictions as well as dramas, there is a skill in the combination of the plot, and a power of description in the incidents, in 'Mathilde,' which his earlier tales did not prepare the reader for. The highest critical authorities have admitted that the author is at his best. This novel possesses the charm of national colour, and the 'Wandering Jew.' These two novels originally appeared in the 'Journal des Debats' and the 'Constitutionnel,' occupying by their great length nearly three years in the course of publication. Including the interval between the conclusion of one number and the beginning of the next, the whole, the whole of the four years from 1842 to 1846 was taken up with these baleful writings, and the ferment and agitation of the public fancy was excited to the highest degree, with the result of a strong and spontaneous accession. The original edition was proposed and accepted for each of the four volumes at 100,000 francs (4000L); but it is understood that they were purposely extended and developed, on account of their unex-
the author. They were afterwards republished in volumes, going through many editions, and being translated into most living languages. "Martin, l'Enfant Trouvé," appeared in 1831 in the form of the "Constitutionnel," and "Les Sept Pêchés Capitaux," in the same paper in 1847-48. Perhaps the most serious censure passed on his writings was that passed on this last by the author himself when he said in braved, 1866, "that he would show the fair side of all these sins;" for in these essays of a delightful and elegant piece of humor separate tales is nothing else but an apology for each and all of them. The first of these tales—"Pride"—is perhaps the masterpiece of Eugène Sue; the second tale—"Envy"—contains one very dramatic scene; but his & Avarice, his & Sloth," &c., are unnecessary of his reputation.

The "Mystères du Peuple," published in 1852, is the last fiction of any note produced by the pen of this voluminous writer. It is intended as an exposure of all the misery and injustice to which the common people of every country have been reduced in all the crises of the world. After the Revolution of Feb. 1848, Sue, who had abandoned his early conservative principles for extreme democratic and socialistic ones, was elected a representative of the Assemblée Nationale; but after the election of Napoleon III. he took no part in politics. He died on Aug. 3, 1867.

SUNDREW. [Drosela, S. 1.] SUN-ROSE. [Helianthemum, S. 1.] SUNDAY. [Miscellaneous; and other liquors on Sunday are now regulated by the statutes 11 & 12 Vict. c. 49, and JS 19 Vict. c. 79.]

SURGERY. Some references which have been made in other parts of this work will here be made good.

Anus, Dis positioned or. The treatment of the most common diseases of this part of the body is that which is commonly known by the name of Fistula, or Fistula in Ano. This disease consists of a fissure or sinus by the side of the rectum. It sometimes opens externally, without communication with the bowel, and is then termed blind external fistula. It more frequently communicates with the bowel, without opening externally, and is then called blind internal fistula. Usually, however, these sinuses have an opening internally and externally, and the general name of fistula is given to them. In this latter form pus, fistas, and fistulent matter, are discharged from the openings. It is accompanied by heat of the parts, great discomfort, and sometimes pain and spasm of the sphincter muscles. It is sometimes attended with acute inflamion and is a very serious complaint. When this kind of abscess occurs, the healing is prevented by three circumstances:—1. The fistulous condition of the cavity. 2. The presence of foreign matters. 3. The frequent motion of the part by the action of the neighbouring muscles.

This disease originates most frequently in the interior of the bowel by a small ulcer, which, extending, at last produces a second opening. It is often found in persons labouring under pulmonary consumption, and its persistence and inconvenience are increased by the constant cough which accompanies this disease.

The treatment of fistula is simple, and usually very successful. By laying open the whole of the sinus and dividing the bowel under which the main obstruction to the cure of this disease are removed. The mode of operating in this case is simple. A grooved probe is introduced into the external opening until it passes out at the internal opening. A probe-pointed bistoury is then introduced along the groove, and the sinus is laid open by the scarifying instrument. Usually not very important vessels are divided in this operation, so that all that is necessary after is to introduce a slight dressing of lint. An opiate should be given after the operation.

Hemorrhage in an enlarged condition of the veins supplying the anus and rectum. This disease is divided into two kinds, external and internal. It seldom occurs before puberty, and is more common in females than males, and in rich and luxurious, than in the poor and hard-worked. Thus, whatever means are taken to determine blood to the lower part of the rectum, and to retard the return of blood from that part, favours this. Thus they come on in pregnant females, in persons troubled with habitual constipation, abdominal tumours, obstructions in the portal system of veins, and in those who lead sedentary lives or who feed too well.

Externally, this comes under a congeries of varicose or enlarged veins, which are surrounded by a condensed and enlarged connective tissue, and are covered partly by mucous membrane and partly by loose rugous integument. The parts are sometimes inflamed, at other times free from any capillary dilatation, but more commonly they are all thickened and becomes ulcerated. It is under these circumstances that the coats of one or more of the veins give way, and they bleed to a greater or less extent. When this does not take place they do not bleed. These two states are called respectively "complete" and "incomplete.

The treatment of this form of piles may be either palliative or radical. The radical cure consists in removing the part either by the scissors or by incision, and leaving them to heal in the ordinary way, or a ligature may be passed round the enlarged vessels, and the strangulated part left to bleed off. When this operation is not thought desirable, much may be done to relieve the enlargement and pain of piles by a pal- liative treatment. Whatever will remove the loading of the glands in the lower part of the bowels will relieve this thus. But parturition removes them when caused by pregnancy. If the part is inflamed, rest, purgatives, poliothesics, and med- ianeous applications may be had recourse to. Astringent appli- cations combined with opium may be applied, as gallic acid tannic acid, or a tincture of sarsaparilla, a cold pack of castor oil, or an electuary with the confect of saffron, sulphur, and cream of tartar. In cases where the liver is affected, the state of this organ should be especially at- tended to.

In the natural piles, are of three kinds: 1. Varicose veins sur- rounded by enlarged connective tissue, and covered by mucous membrane, and bleeding or blind. 2. Tumours the nature of sarcoma. 3. A congeries of blood-vessels resembling erectile tissue, and occurring in the submucous layers of the rectum. The third is the most common. They may protrude from the anus or not. When they do not, they descend occasionally when the bowels are acted on, and become very troublesome till they are returned. If protruded they are kept in by means of a water-soluble con- vulsion, or pitch. If the bowels are not acted on, these cases bleeding usually occurs when the bowels are acted on. When the tumours are replaced, no great in- convenience occurs. If, however, the bleeding continues, the patient becomes pale, thin, and weak; noises in the ear and heart may be heard; and in fact all the symptoms of anaemia set in.

The treatment in this case may be either palliative or radical. Frequently the latter course should at once be had recourse to. The internal tumours are seldom of a kind to allow of their removal, and the safest process. When the base of the tumour is small, it may be pulled down by a tenaculum and a single ligature placed round it; but when the base is broad, a needle with two ligatures is passed through the tumour and is tied round each half of the tumour. This operation is very painful, and difficult, and wherever circumstances will admit is greatly facilitated by the use of chloroform.

The operation opleia should be given.

Nitric acid has been recently recommended in these cases, but unless the tumours are small, and the cases slight, the remedy is liable to fail, and after the infliction of much pain the operation must be had recourse to.

Should the palliative treatment be had recourse to, all bowels under the head of external piles, must be attended to. Astringent remedies and opiates must be injected into the bowels. To the bowels must be regulated, the liver looked to, and when all of the stomach is irritated and the bowels are not kept under control, it will be necessary to have a ligature placed round the tumour, and not to allow it to protrude. When the tumours have retired, they must be treated as in internal cases.

Protoplasma Am is a very frequent and troublesome affection of the lower bowels. In consequence of relaxation the rectum passes down, and becoming exerted protrudes itself beneath the anal opening. This condition is called "Protoplasma Am an incomplete. It is called complete when the entire bowels come down, and partial when the mucous coat alone descends.

The latter is the most frequent, and sometimes accompanies internal piles. Children and old persons are most affected. The bowels in many cases pass into a membrane which passes down varies in size, from a mere annular enlargement to a tumour as large as a child's head. It is sometimes accompanied with inflammation, and the
mucous membrane throws off a coloured discharge. Great pain and uneasiness are often felt, and general languor and dyspepsia are present.

The treatment, rather palliative or radical. When this disease depends on general constitutional weakness, tonics, change of air, and a proper regimen, will restore the patient to health. The bowel should always be returned as speedily as possible to a state of health, and be done by purgation or lubricating the parts. When they are inflamed, leeches should be applied and rest secured before attempting reduction.

The radical cure is effected by removing one or more of the redundant folds of the mucous membrane by the knife or ligo matter forceps. They are generally removed through the replaced parts, or the bowel may be left intact, and a portion of the redundant external integument may be removed, which by its subsequent contraction prevents the painful protrusion.

Imperforate anus. Children are occasionally born without an anal orifice. Three forms of this malformation are described: 1. The rectum may be fully developed, and have its orifice closed by an external membrane, or a septum may be developed at some distance from the orifice. In the treatment of this form of imperforate anus, nothing more is required than an incision through the occluding membrane.

2. The rectum terminates at some distance from the perineum, and there is a mere depression where the anal orifice ought to be. This is called obturated external anus. A second operation may be required to make a more serious operation than the last. The meconium should be allowed to accumulate, and pressure being made on the abdomen, an incision must be made down to the bowel, and a passage thus established. 3. In this form the rectum is very much dilated, and the rectum itself is filled up with the last may be performed, and failing this, an attempt may be made to form what is called an artificial anus. This operation is performed not only for imperforate anus, but in cases where, from tumours, or the impaction of foreign matters, the faecal matter cannot pass through the orifice, a colostomy or sigmoid flexure of the colon is the part which is preferred for this operation. It may be reached from before or behind. The former is the easier operation; the latter is the most convenient position for the new opening to the patient. In performing the latter operation, an incision is made midway between the last false rib and the crest of the ilium. The colon is then secured, an incision made into it, and the edges of the bowel brought in contact with the external wound by means of ligatures. This operation has been successfully performed in cases of non-malignant tumours and other causes of the impaction of the lower bowel. In children with imperforate anus, however, it seldom succeeds, as other malformations often exist which speedily terminate the life of the infant.

Acute Aortitis, is either limited to a particular spot, or it spreads along the course of the artery. When limited, this disease arises from external injury, and is a common result of wounds and ligatures. In the milder forms, this inflammation is attended with the excitation of a plastic matter, which fills up the artery and leads to its obliteration, a result which is sought for in the application of a ligature to arteries. The inflammation may, however, proceed to suppuration and ulceration, and the latter operation may be employed. In the case of the aorta, the result is usually deleterious, as the aorta has no coats, and may also come on from a ligature being applied too tightly. In the treatment of such cases the ordinary remedies for inflammation should be applied. Cooling applications should be made to the part, and rest, and an antiphlogistic regimen may be employed. The spreading form of aortitis occurs in middle age in persons of broken constitution. It is seldom confined to one vessel, but affects the arteries of a whole limb. The tracks of the blood are frequently calcified, and the disease is fatal as the arteries become more and more condensed into mere fibrous bands. The whole constitutes a vascular network of great capacity and activity of circulation, supplied, for reception of the returned blood, with large and tortuous vessels, whose lining membrane is plainly conti-
tissues with that of the abnormal vascular cells. Also in the
nasal blood are to be found the feeding arteries; originally,
perhaps, twigs, now enlarged to trunks pulsating strongly,
and obviously carrying on a plentiful and active supply." (Miller,
"Practice of Surgery.") Such is the nature of those tumours
which partake of the character of true erectile tissue. Like
the blood-vascular tumours, they become enlarged and di-
minished in size, according to the sluggishness or activity of
the blood circulating through them. They are compressible,
elastic, and of a reddish hue. They are usually subcuta-
aneous, but, sometimes, submucous also. The most common
situations are beneath the integuments of the face, head,
neck, back, and buttocks. The tumour pulsates synchron-
ously with the heart, and may be considerably diminished
in size by pressure, but resumes its usual condition when
the latter is released. In one case, the seat of the tumour
was dull and rough, sometimes accompanied by a vibratory
thrust.

Ulceration is likely to occur in these tumours, and lead
either to great hemorrhage or their removal.

Erectile tumour may be treated in three different ways:

1. The tumour may be removed. This is always better
done than by the ligature than by the knife.

2. The tumour may be starved by diminishing the ar-
terie supply of the same, as in the case of true aneurism,
by the application of a ligature to the artery or arteries
which supply the tumour with blood.

3. The structure of the tumour may be changed. This
may be effected in various ways: as by pressure, the intro-
duction of corrosive sublimate, the injection of the arm, or
the application of warm acid, or other agent. A hot needle
may be run through, or a wire connected with the poles of
a galvanic battery may be passed through the tumour. All
these plans have been found to succeed with small erectile
tumours.

Varix of the Arteries.—A tortuous and dilated condition
of the arteries frequently comes on in the smaller arteries,
and produces a painful tumour. It may be removed in the
same manner as varicose veins.

If a ligature is applied to the opening of an
artery for the purpose of drawing blood, as phlebotomy
is applied to the same operation in a vein. When it is thought
desirable to take blood in large quantity and with much
rapidity, it is better taken from an artery than from a vein.
This operation however is more difficult to perform, and
may be attended with ulterior consequences. Hence phle-
botomy or venesection is always preferred, except under
urgent circumstances, as the means of drawing blood from
the system. When arteriotomy is performed for the sake
of blood-letting, one of the superficial anterior branches of
the temporal artery is generally selected. In this position
the wound is easily healed afterwards by pressure. The ac-
idental wounding of an artery, as is sometimes the case in
bleeding from the arm, is likely to result. The fact that the
potash nitric acid may lead to false aneurism and the necessity of placing a ligature round
the wounded artery. Sometimes false aneurism follows
arteriotomy in the temporal artery, and in this case it
becomes necessary to ligature the artery proximally.
Sometimes on removing the compress after arterio-
tomy, an ulcer is found to be formed. If the ulceration
spreads, the vessel may be opened and haemorrhage occur.
In this case also the artery must be tied.

Bladders, Disease of.—The bladder, like every other
organ of the body, is liable to inflammation. This disease
is called Cystitis. When present there is pain and tenderness
in the region of the bladder, a desire to urinate, and, at
times, pain in the urethra. The urine is rendered very
freely. This is due to the liberation of struvite, or phosphatite.
The passage of the urine is often a cloudy or brownish
mixture with blood. These local symptoms are accompanied
with general fever. The inflammation may extend from the
bladder to the peritoneum. The bladder becomes enlarged and di-
minated in size.

This disease may come on after the operations of
lithotomy or lithotripsy, or other direct injury. It may be
the result of specific inflammation of the urethra, extending
to the bladder, or it may come on from irritating medicines
acting on the bladder epithelium. In its treatment antiphlogistic remedies of an active kind
are needed, such as bleeding generally and locally, antimony,
calamint, and opium. Opium should be given by the mouth
and the three per cent. dose of opium by the nose. The
bowels should be opened by enema and general purgatives;
the recumbent position must be absolutely enjoined.

Cystitis may become chronic, or a chronic inflammation of
the bladder may be produced by irritation in neighbouring
organs, as in the urethra, rectum, or kidneys. There is pain
in the bladder, frequent micturition, and mucus in the urine.
The mucous membrane of the bladder may ulcerate, and then
the urine is mixed with blood and pus. The ulceration may extend through the bladder to the surrounding organs.

In the treatment of this disease, the obvious cause must be
removed. Opium for the pain, a generous diet, astringent
infusions, as of buchu, and mineral acids, are principally
recommended. Iron is sometimes of great use, also
sodium bicarbonate and distilled water. The hypogastrium, or over the
sacrum, should not be neglected. In very chronic cases it has
been recommended to wash out the bladder with warm
water by means of a double catheter. Lallemand recom-
mands the direct application of the nitrate of silver.

In the bladder the symptoms resemble those of cystitis. There is frequent
micturition, uneasiness in and about the region of the
bladder, and the patient feels disagreeable sensations in
the abdomen. The urine is mostly limpid and clear.

It depends on some derangement of the kidneys or general
health, or it may come on from stones, piles in the bladder,
or thread-worms.

In treating this state the great thing to be done is the removal of the cause of the disease. Where it comes on in a
generally decayed state of the health, the treatment must be
directed to this condition of the system.

Hematuria.—Blood in the urine may present itself when
the kidneys, bladder, or urethras are affected. When it arises
from the kidneys, it may be due to the presence of small tabular cysts, produced in the tubules of the kidneys.
When the bladder is the seat of stone, cystitis, or malignant:
tumours, bloody urine may make its appearance. When
the hemorrhage proceeds from the urethra, the urine is
away independent of the urine. In these cases the causes
of the hematuria must be treated.

Incontinence of Urine or Enuresis. This disease presents
itself in two classes of cases, in children, and in adults.
The former is always the result of disease or of some trouble
from the bladder, and produces a difficulty in emptying it.
The urine is usually passed voluntarily during the day, but in
the night it passes away involuntarily. Although frequently
acted as though it were a bad habit, it is the result of a
morbid state of the system, which must be removed, and
the will should only be called into exercise to assist a
judicious system of treatment. All causes of general debility
should be removed. Sea air, cold sea-bathing, with the
administration of iron, especially the tincture of the sesqui-
chloride, are the most appropriate remedies for the want
of tone of the nervous system which accompanies this
disease. Strychnia has been recommended. The child
should not lie on its back, and it should be awakened in the
night, at stated intervals, to pass the urine voluntarily.
Meat is also recommended.

In the incontinence of adults, either the urine passes away
from previous retention, or, as happens in aged people, the
bladder loses its tone, and both its expansive and retentive
powers decline. In the former case the abnormal urine
must be employed to empty the bladder, and the retention treated.
In the other case, tonics and other remedies necessary for the
debilitated state of the system must be employed. Generally,
however, little can be done, and cleanliness and the use
of stimulants is the only means left.

Retention of Urine. This arises from various causes,
and the treatment must vary accordingly. The symptoms in all
cases are, an inability to evacuate the urine, whilst the desire
to do so is constant and frequently accompanied with pain.
This may be directed to the bladder, which is usually
distended above the pubes, there is dulness on percussion
there, and pressure produces great pain. Sickness is fre-
quently present, the pulse becomes rapid, the skin hot, and
at last symptoms of the absorption of toxins begin to
press upon themselves, and unless relived, the patient dies from
the blood becoming poisoned by the use of the urine. All
these symptoms are removed by the removal of the urine.
This may frequently be done by the catheter, but the disease
can only be cured by the removal of the cause.
The following are enumerated as causes of this disease;
Stricture of the urethra. Inflammation of the urethra.
Irritation and spasm of the neck of the bladder.
Calks in the bladder. Stones in the bladder or perineum.
Prostatic ulcer. Blood in the bladder. Malignant
disease of the bladder or urethra. Imperforate urethra. In each
S U R 669 S U R

of these cases a special treatment is necessary, but in all
it should be remembered that fatal results will occur
unless the diseased viscous is emptied of its contents. It
often happens that for this purpose the catheter cannot
be passed into the urethra; under these circumstances the only
means left is to puncture the bladder. This operation may
be performed from the perineum, the rectum, and the pubes.
In puncturing the bladde the operator is cautious not to
reach the intestines which are in immediate relation to the
pu!es; for this purpose, the abdomen in the region of the pubes
was resected to the exterior. [Lever.] When this operation is
undone, the bladder may be resected from the rectum and punctured
here. It is only when these two methods are found to be
impracticable that the operation is resorted to; and since the
abdomen in the region of the pubes is resorted to, the herniate
these operations are not often performed: "but any
one of them is much preferable to any time to postpone
of relief, and consequent disaster by extrava	ation; and
all, too, are preferable to pushing a metallic catheter
by sheer force through an impassably straitured urethra."

(Miller.)

Diseases of the Prostate. The prostate gland is liable
to the various diseases of other parts of the urinary
organ; it may be inflamed, or abscess may occur in it, or it may be
subject to malignant disease. It is, however, most liable to
enlargement or hypertrophy, which is one of the most
troublesome and frequent diseases to which old age is liable.
It is a common fact that during the progress of this disease, and
is the result of inflammatory action, and the other is an enlarging
general independent of that process. The first is only
temporary, and may be frequently speedily removed by treatment.
It is the result of stricture, stasis, affection of the rectum
or irritation to the perineum, in the latter the
purifying, the recurrent position, and counterirritants, are
the proper treatment. The second form of enlarged prostate
is more difficult to manage. It is one of the conse-
sequences of increasing age. The enlargement in these
cases may be partial or general. One of the most painful
consequences of either is a difficulty in passing the water.
This comes on gradually, and is also attended with difficulty
in emptying the rectum, as this organ is pressed on by the
diseased prostate. In the latter condition the bladder is
empty the bladder are more frequent, and the act is less
perfectly accomplished, and a portion of residuary urine
remains in the bladder behind the enlargement. Under
these circumstances the bladder becomes irritable, and chronic
constipation established. The sympotms of this disease are
then added to those of the enlarged prostate.

There is no cure for this state of things, and the treatment
is consequently palliative. Much, however, may be done for
the comfort of the patient by the use of an emetic and
expectorant; the cold or hot fomentations; the act of
and exercises must be avoided. The recurrent position
must be maintained as much as possible. The bowels regul-
ated by enemata and gentle aperients. Opium, iron,
mineral acids, and bichloride of mercury, be given according to
circumstances of the case. In order to give the greatest
distinction the catheter must be had recourse to, and the water drawn off
occasionally.

Breast Diseases. The mammary gland, especially in
the female, is liable to various diseases, requiring the atten-
ion of the medical practitioner.

Irritable Mammary. In both married an married females
the breast is liable to irritation from sympathy with other
parts of the body. In these cases there is often great pain
and uneasiness in the breast, and the whole system suffers
more or less. There is no inflammation, and no swelling or
external alteration of the mammy. The pain is sometimes
intermittent or periodic, similar to neuralgia. When the
general health is affected this must be attended to. Opium
and bichloride of mercury, in order to give the greatest
distinction the catheter must be had recourse to, and the water drawn off
occasionally.

Mammitis. Inflammation, acute and chronic, of the sub-
stance of the mammy is not uncommon. It is generally
considered a cold or hot fomentation, or, during the
period of lactation. The pain is intense; the breasts are
swollen, and tender to the touch. From the first there is
a tendency to suppuration. The secretion of milk is perverted
and inedible, and the symptoms of inflammation with fomenta-
tions and poultices should be applied to the breast.
The bowels should be kept open, and the fever subdued.
When matter forms it should be early evacuated. A chronic
inflammation is sometimes observed. When this is the case
stimulant applications to the breast will be found useful.

Where this is attended with abscess it should be opened, so as
to give free exit to the pus, and pressure applied.

Tumours of the Breast. The breast is subject to various
kinds of growths and general enlargement. The chronic
mammary tumour" of Sir Astley Cooper consists of a partial
hypertrophy of the gland. Enlargement of the whole gland
frequently takes place. These enlargements may be got
by pressure and treatment of the general health. The
mammary tumours may be simple, cystic, inflammatory, neoplastic,
malignant tumours. In many of these cases it becomes necessary
to remove the breast. This is done in the following manner:
"The patient having been placed recumbent, and duly
assisted, the arm on the affected side is raised and held
by an assistant, so as to stretch the pectoral muscles and
facilitate incision. The knife is entered in the axillary aspect
of the tumour in a line with the mammales, and is moved in a
semi-elliptical direction towards the opposite point; a similar
procedure is adopted—above or below, as the case may be—
to complete the ellipse, and the size of this space necessarily
varies according to the extent to which the integument seems
to be involved, and according to the natural laxity of the
parts. It is a fault to take away an undue amount of sound
in the healthy part of the arm. The objective is to remove
and maintaining apposition of the wound; but it is a worse
error to leave taint parts, whereby reproduction of the disease
cannot fail speedily to ensue. It is well to make the lower
incision first, otherwise its course and position are apt to be
uncertain until the sound part of the arm is delivered. If the
knife is sloped through the subcutaneous part; and
regular dissection is proceeded with from the axilla down-
wards, dividing the principal vessels and nerves at once, and
avoiding the clavicle, the operation comparatively
bloodless and free from pain. The dissection, with
its border of comparatively sound tissue, in the case of
malignant tumour, having been removed, is carefully exa-
mined on every aspect by both sight and touch; and, if need
be, the arm amputated, which, when needful, is surely
apparent. The vessels having been secured, the
wound is brought together and treated in the ordinary
way."

Much has been recently said of the removal of malignant
tumours, especially of the breast, by means of excision.
It is always difficult to decide exactly as to whether a
tumour is malignant; and from all that has hitherto been
made known of these formations, it would appear that, if
they are local in their distribution, the patient and
they were not malignant. With regard to general treatmen,
the evidence is very decisive that we possess no internal
remedy that has any known influence over the progress of
those tumours which are truly malignant. A recent Ame-
rican writer has recommended the use of general
and local treatment, which has been witnessed
and reported on in this country. The cases referred to were
referred to the Middlesex Hospital. The general treatment
consisted in the administration of iodide of arsenic and the
Sanguinaria Canadensis. The local treatment consisted in the
application of the Sanguinaria and chloride of zinc.
The method employed was to make a decoction of the
Sanguinaria, and, with an equal quantity of the chloride of
zinc, to make the whole into paste with common
butter. This paste was applied directly to ulcerated cancers
and, when the skin was unbroken, nitric acid was first employed
in the form of an eschar. After this treatment, the
paste was inserted into the incisions on pieces of calico. This was continued from two to three
weeks, till the whole depth of the tumour was penetrated and
removed. When this was effected the application of
the paste was discontinued, and the wound allowed to
heal by itself. The following passage concludes the report of the special
staff of the Middlesex Hospital on this mode of
treating malignant tumours:
"The last particular of this treatment is the practice of incisions; and we are of opinion that this is its only but its
very great merit. The Sanguinaria is inert; the chloride of
zinc paste was known before; but the incisions constitute a
new feature in the treatment of cancerous tumours for
which we find no parallel in the writings of the past, or in

Digitized by Google
the practice of present surgeons. Cancer in its constitutional nature remains as ruthless and as insidious as ever.

Suzamnite. [Mineralogy, 8.1]

Sweden. In 1859, to date the population was given in the previous article, it amounted to 3,109,772. The following table shows the increase, and also the lands or provinces into which Sweden is divided —

This area, increased by 3548 square miles of water not included in the lands, and the population column by 97,952, the result of the increase of the inhabitants of Stockholm, the capital of the kingdom, gives the total area 169,381 square miles, and the total population 3,641,600.

Manufactures. — The industrial products of Sweden comprise vast quantities of linen, which is manufactured in almost every house, woollen-cloth and other stuffs, refined sugar, tobacco, paper, leather, glass, some calicoes and other cotton goods, cotton twist, silks, china-ware, cast-iron, sailcloth, soap, spirits, beer, &c. Ship-building is carried on to some extent in most of the harbours of the Baltic.

Internal Commerce. — The internal commerce is in corn, salt, and manufactured goods, especially the linens of Wernerborg-Län, which are carried to the most remote parts of the country, is very considerable. This commerce is facilitated by the good roads and the winter by the whole country being covered with snow for four or five months, which renders the conveyance of goods in sledges easy and expeditious. In summer a like advantage is derived from the navigation of the sea, which washes most of the provinces. The Trolhättan Canal is navigated by a great number of barges, which bring down to Göteborg, for export, large quantities of iron and steel, and timber in planks and boards; and they carry into the interior corn, whisky, salt, herrings, sugar, butter, fish, wine, and some other articles. Large barges ply also on the other canals, conveying heavy goods of different descriptions, such as bar-iron, alum, corn, salt, herrings and atronines, whisky, bricks, and tiles. A railway has been commenced, of which a portion, from Örebro to Arboga, with a branch from Dylwa to Norns, was open in 1865. It is intended ultimately to connect the Wener Lake with the Malma lake, and thence with Stockholm, Arboga being a great entrepôt for iron.

Navigation and Foreign Commerce. — The Swedes are much given to sea-faring life. Their vessels visit most of the countries contiguous to the Atlantic, and they are also employed, especially in the Mediterranean, and on the coasts of South America and the Mediterranean. The mercantile navy at the end of 1855 numbered 3274 vessels (carrying together 126,226 lasts), exclusive of those carrying less than ten lasts; and 181 steamers. The total number of foreign (including Norwegian) ships that entered Swedish ports in 1855 amounted to 6733, carrying 206,900 lasts; the departures numbered 10,656 vessels, measuring 425,384 lasts. The imports were valued at 26,601,000 crowns; the exports at 83,998,000 crowns. The foreign trade was second to most countries in America and Europe. The chief imports are brought from the following countries, which are named in order of the values:—The Hanse Towns, Great Britain, Brazil, Norway, Russia, Denmark, United States, East Indies and Australia, Prussia, and the West Indies. The exchanges for Swedish exports are Great Britain, Denmark, the Hanse Towns, France, Prussia, United States, Russia, and Portugal.

The principal articles of export from Sweden are iron and timber. Norway takes a considerable quantity of iron, and sends in return to Stockholm goods from Finland in three-fourths of the fire-wood which it consumes, the northern provinces not being able to supply the article either so cheap or so good. Finland also exports to Stockholm meat, butter, cheese, bacon, flour, hides, pitch, and tar. Other articles of export are copper, cobalt, alum, tar, pitch, hemp, oil, paper, tree bark, tobacco and snuff, bricks, furs, some lines, linens, vessels, and some minor articles. The chief articles of import are sugar, coffee, salt, fish, hides, cotton, tobacco, and wool; vegetables, linens, cottons, wine and brandy, dyestuffs, raisins, almonds, pepper, cinnamon, arrack and rum, butter, bacon, tobacco, soap, tram-oil, ginger, lacquered ware, tea, tallow, potash, and oil.

Education.—Sweden has two universities, Uppsala and Lund. The national situation of the form is about 1000 students; at the latter, between 400 and 600. There are besides, 12 gymnasia for higher instruction, preparatory to the universities; 41 lardums skolas, or grammar schools, and 40 apologist schools, where the common branches are taught, with, in some instances, French, English, and German. The usual term of instruction, the law of 1849 commanded the erection of a school in each commune or parish. Owing to the sparseness of the population this was found to be in many instances impracticable; in such cases however the communes are divided into districts, each of which is visited in turn by the village schoolmasters. Schoolmasters are trained by government and paid by the communes in kind. In 1860 there were 2107 stationsary and 1381 ambulatory schoolmasters. Of the masters, 918 were clergymen and 690 church clerks. In that year, 143,526 children were receiving instruction in the stationary schools, 126,178 in ambulatory schools, 129,996 were instructed at home, 9238 in the secondary schools above named, and 17,468 in private schools, making a total of 429,988 altogether under instruction. It is a general practice in Sweden for parents, especially those who live in the country, to instruct their children in the long winter evenings.

Finance, &c. — The income of the state has been calculated for 1838 and 1837 at 14,556,300 crowns; and the expenditure for 1838 was 12,870,000 crowns; but in the budget proposed for 1838, 1839, and 1840, the receipts are set down at 25,427,600 crowns, and the expenditure at 24,817,000 crowns. These sums are for Sweden independent of Norway. The strength of the army is stated to be under MUNTFR AND NAVAL FORC S. S. 2. The present King, Oscar I, succeeded his father in March, 1844.

SWITZERLAND. There is no material alteration in Switzerland, but the following table gives the area of the different cantons, the number of their representatives in the National Council, and the population in 1860.—

</table>
to construct free from that impediment. And, even whilst she was upon the stocks, she was considered to present such excellent qualities, that it was deemed Captain Symonds had already given sufficient proof of his skill in naval architecture to be entitled to post and responsibility in that profession. In 1832 on the 9th of June, he was offered, and accepted, the office of Surveyor of the Navy, in succession to Sir Robert Seppings. This appointment was associated with the entire removal of restriction as to the amount of tonnage in ships of the Navy. Captain Symonds therefore had liberty for the exercise of judgment and talent in designing ships, which had not been granted to the commissioners or surveyors of the navy before; so that he might at once build ships of a size and form that he thought would be better adapted to the purposes and responsibility that he thought would be better adapted to the purposes and responsibility that science and practice had yet indicated. This freedom from conditions in determining the dimensions of ships, was taken ample advantage of by him; having a great principle to bring out in practice, he applied it with a decision, which, in a short time, altered the general character of no inconsiderable part of our navy. He had the merit of having boldly taken the lead in a path which future constructors, intending to carry on improvements in our ships, may pursue with the highest advantage. Considerable difference of opinion exists as to the value of the totality of qualities possessed by Captain Symonds's ships; but it was remarked in 1840, two years after he had retired from office, that of the 180 vessels of different kinds, built during the period of sixteen years, for which he had been Surveyor of the navy, and all upon the same principles of construction, but of a different form, and as originally adopted in the Pantaloon, none had foundered. Captain Symonds received the honour of knighthood in 1836. He had received the thanks of the Admiralty in 1830 for a memoir containing 'Sailing Directions for the Aden and Red Sea; and again, in 1837, for 'the valuable qualities of his several ships, and for improvements introduced by him into the navy;' he was elected a Fellow of the Royal Society on June 4th, 1836, and nominated a C.B. of the Civil division in 1846. In 1854 he was placed in the Royal Navy pension list. He died, March 30, 1856, on his voyage from Malta to Marseille.

(O'Byrne, Naval Biographical Dictionary; Fincham, History of Naval Architecture, etc.)

SYNAPSE. [Chemistry, S. B.]

SYNAPSE, a family of Echinoderata, belonging to the order Holothuriidae. It is characterised in this order by the absence of suckers. It is represented in the British seas by the genus Chirodiscus, which has a cylindrical and vermiciform body, elongated tentacles, digestive at their extremities.

C. digitata has a vermiciform body, white with orange spots, the tentacles long, pedunculated, digitate. This animal was first found by its specific name, and its habits are very rare. Professor Forbes, in his 'History of British Star-Fishes,' says that he never had seen a living specimen.

SYNAPTASE. [Chemistry, S. B.]

SYNAPONIDAE, a family of Fishes, embracing, according to some authors, the Pipe-Fishes, the Sea-Horses, and the Winged Sea-Horses. These forms are sometimes assigned to distinct families, as in the following descriptions:

Synapontidae, Pipe-Fishes. Body prolonged, slender, linear, or angular; mouth greatly prolonged, cylindrical; mouth terminal, vertical. Ventral fins absent; caudal fin wanting in some.

Hippocampidae, Sea-Horses. - Head and body compressed; snout narrow; mouth terminal. Pectorals small; dorsal single; caudal fin wanting.

Pegasidae, Winged Sea-Horses. - Body broad, depressed; snout suddenly contracted, narrow, somewhat protractile; mouth terminal, beneath. Pectorals generally large; caudal fin small.

They all agree in having the endo-skeleton partially ossified; exo-skeleton ganoid; gills tufted (hence the group is named Lophobranchia), in the opercular aperture being small, and the swimming-bladder without an air-duct. We shall illustrate this family by a short description of the British species:

Synapontus has the body elongated, slender, covered with a series of indurated plates arranged in parallel lines. Head long; both jaws produced, united, tubular. No ventral fins.

In certain of the species the males are furnished with an elongated pouch under the tail; these are called...
merapai, and include the British species *S. Aenus* and *S. Aenus*.

*S. Aenus*, the Great Pipe-Fish, is one of the most common forms of the genus. It is found on many parts of the coast, sometimes at low water amongst sea-weed; at other times in deep water. The most curious feature in the economy of this fish is the fact that the roe is transferred from the belly of the female to the pouch of the male.

*S. Typhon* (Linnaeus), the Deep-Nosed Pipe-Fish, Lesser Pipe-Fish, or Shorter Pipe-Fish; *Aenus Aristolotus* and *Typhon antiquorum* of Wullingham. This fish is distinguished from the last by the more compressed form of the jaws. From the British species it is distinguished by the possession on the part of the male of a pouch for the reception of the ova. The habits of this fish resemble those of the last.

*S. anguineus*, the Snake Pipe-Fish. Although this and the preceding species possess no subcaudal pouch, the ova after expulsion from the female are carried by the male in separate hemispherical depressions on the external surface of the abdomen.

*S. ophidion*, the Straight-Nosed Pipe-Fish, is known by its straight jaws about nine inches in length.

*S. lumbriciformis*, the Worm Pipe-Fish, is the smallest of the British species. It has been taken on various parts of the coast. It does not exceed five inches in length. The young of this species have been observed to undergo a curious change in their appearance; their body is covered with a fin-like membrane, and it also possesses

pectoral fins. During their growth the caudal membrane and pectoral fins are absorbed.

**Hippocampus**—The jaws are united and tubular, the mouth placed at the end. The body compressed, short, and deep. The whole length of the body and tail divided by longitudinal and transverse ridges, with tubercular points at the base of the teeth; both sexes have saccate and dorsal fins; the females only have an anal fin; neither has ventral or caudal fins.

**H. brevirostris**, the Sea-Horse, or Short-Nosed Hippocampus, is occasionally met with on our British coasts. The habits of these creatures are very singular. When swimming about they maintain a vertical position, but the tail is ready to grasp whatever meets it in the water. It quickly entwines in any direction round weeds or other objects, and remains in that position for many minutes, and darts at its prey with great dexterity. When two are together they often twist their tails together. Their eyes move independently of each other, as in the chameleon.

**Pegasus** has a snout as in the previous genus, but the mouth is under it, and movable. Two distinct vertical fins behind the pectoral, which are often large, hence the name of *Pegasus*, or Flying Horse. The species are found in Indian Seas.

**TALFORD, SIR THOMAS NOON, Knt.,** was born January 26, 1756, at Doxey, a suburb of the town of Stafford, where his mother was then on a visit. His birth was premature. His father was a brewer at Reading in Berkshire. His mother was a daughter of Thomas Noon, minister of a congregation of Independents in that town, to which seat his father also belonged. Thomas Noon Talford was educated at the grammar-school of Reading, under Dr. Valpy, for whom he always entertained an affectionate respect. In the year 1813 he was placed for legal study in London. Oliphant, the publisher, in 1817 commenced practice as a special pleader on his own account. During many years of the earlier part of his residence in London his income was derived chiefly from his literary labours, as a contributor to the 'London Magazine,' the 'New Monthly Magazine,' and other periodicals. He was called to the bar by the authorities of the Middle Temple, February 9, 1821, and in 1822 he married the daughter of John Towell Rust, Esq., of Clapton, near London, the editor of Dr. Priestley's works. He soon afterwards joined the Oxford Circuit. By steady application, rather than by any peculiar aptitude or liking for the law, he gradually rose in his profession. He was a fluent speaker, distinguished by feeling and fancy, more than by argumentative powers. After about ten years practice he applied for a silk gown, but his claim of the dignity of Queen's counsel was deferred till his patience was exhausted, and he therefore, in Hilary Term, 1833, assumed the cotf, and became Mr. Serjeant Talford. He was also for some years Recorder of Banbury. At the general election in 1835 Mr. Serjeant Talford was returned to parliament as one of the members for the borough of Reading, Mr. Fysh Palmer, the previous liberal member, having retired. In 1837 Mr. Talford again came forward, and was returned with Mr. Talford. At the next election two conservatives were returned, and Mr. Talford was out of parliament from 1841 to 1847, when he was again returned for Reading, and retained his seat till July 1848, when he was appointed successor to Mr. Justice Coltman in the Court of Common Pleas, on which occasion he also received the honour of knighthood. As a member of the legislature Mr. Serjeant Talford may be said to have added two valuable enactments to the statutes of the realm—the Custody of Infants Act (2 & 3 Vict., c. 64), and the Corrupt Right Act, which he first introduced in 1837, but which was strongly opposed, and was not passed into a law till 1842 (3 Vict., c. 45), when he was not a member of parliament, and then in a modified form. During all this period of legal and parliamentary activity Mr. Talford continued his labours in literature. He was for several years law-reporter of circuit cases for the 'Times' newspaper, and he continued to contribute to the 'London Journal, the 'New Quarterly Review,' the 'Retrospective Review,' the 'Edinburgh Review,' the 'Quarterly Review,' and the 'Law Magazine,' to which last he was furnished in January, 1846, an able article on 'The Principle of Advocacy in the Practice of the Bar.' In 1835, he printed for private circulation two editions of his tragedy of 'Ion.' On the 20th of May, 1836, the tragedy was acted for the benefit of his friend Mr. Maconley, at Covent Garden Theatre, and at the same time was published. It was afterwards acted with success at the Haymarket Theatre, and elsewhere. The tragedy of the Greek dramatists were occasionally performed by the scholars at Dr. Valpy's school in Reading, and there Mr. Talford acquired his taste for dramatic literature. The first two privately printed editions of 'Ion,' dedicated to his venerable master, who, however, died before it was acted, and then a 'Notice of the late Dr. Valpy,' were prefixed instead of Dedication to the first published Edition of 'Ion.' The title is borrowed from the 'Ion' of Euripides, which also suggests the object of the foundling youth educated in a temple, and assisting in its services, but nothing more. His next tragedy, 'The Athenian Captive,' was published in 1838, and was performed in the same year at the Haymarket Theatre, and with moderate success. This tragedy was succeeded by that of 'Glencoe, or the Fate of the Macdonalds,' first represented at the Haymarket, May 23, 1840, 'The Castilian,' an Historical Tragedy, in Five Acts, was published in 1853, and one of these tragedies does not display much of what may be properly called dramatic skill, nor does he exult that kind or degree of interest which arises from distinctness and discrimination of character.
depth of emotion, and truthfulness of thought and expression. They may be rather regarded as dramas of poetic sentiment and description. The blank verse is smooth, graceful, and fit for English stage. The trunk was large, but all the individuals use indiscriminately the same elaborate form of expression, and the meaning is not unmeaningfully rendered obscure by the redundancy of the diction.

In 1837 Mr. Talbourn published the 'Letters of Charles Lamb, Extracts of his writings', 4to, 2 vols. 8vo, a domestic tragedy of the most affecting interest, which had been long known to a few friends, but was not still then brought within the reach of the public. On the 20th of June, 1844, he was a created a Doctor of Civil Law by the University of Oxford. In 1845 he published 'Vacation Rambles and Thoughts, comprising the Recollections of Three Continental Tours through France to Italy, and Homeward by Switzerland, in the Vacation of 1846', fasc 8vo. The journeys were all rapidly made, and the information which the volumes con- tain is very scanty. Some of his speeches as an advocate and also as a member of parliament were published in a separate form. He was an eloquent speaker, and had an extraordinary facility of expression to be very effective. His reputation is that of a sound lawyer for deciding cases, at the same time that his persevering labour, great practice, and love of justice, made him respected both as an advocate and a judge. In his private character he was a liberal and social in an eminent degree, and he had a large circle of friends, chiefly literary and legal.

The death of Mr. Justice Talbourn occurred on the 15th of March, 1854. He had opened the session at Stafford on Saturday the 19th, and in the evening, while delivering his charge to the grand jury, and commenting on the increase of crime and its causes, he was observed to be much excited. Suddenly his face became flushed, his head bent forward, and in a few minutes he indi- catedly bore out of court to the judge's chambers, where it was found that he had ceased to live. He was buried in the cemetery at Norwood, near London. He left issue three sons and two daughters. In 1855 the members of the Oxford Circuit placed a bust of him, sculptured by Lough, in the Crown Court at Stafford. It is an excellent likeness.

TAXEY, JOHN CHARLES, was born of English parents at Dieppe, Normandy, March 27th, 1790. At the breaking out of the war in 1793, his family, in common with all other English residents at Dieppe, were thrown into prison. At that time the little boy was staying at the country-house of a friend of his mother (Messieurs Carpes, ingénieur en chef des ponts et chaussées du Département de la Seine Inférieure), and when his family, through the interest of friends, had the means of escape given them, he was left behind in France until an oppor- tunity should offer to send him to England. This never occurred. But M. Féral, faithful to his trust, brought the child up as his own son, educated him partly himself and partly at the government school at Pont-Audemer, and at the age of 18 was apprenticed to be superintend- ing the government works he was superintending under the government. In the year 1808 M. Féral got the youth an appointment in the Administration de la Marine, in which service he remained, first as secretary to the admiral of the fleet at Brest, and then as assistant to the Minister at Dieppe, Spozia, Genoa, and Brest, till at the cessation of the war in 1814 he was enabled to renew his intercourse with his family. In March 1815 he obtained a short leave of absence, and hastened to England, where he found his mother, brother, and sister living. He returned to Paris at the expiration of his leave in April, where he found that Bonaparte had escaped from Elba, and had put himself at the head of his army, and that the king, Louis XVIII., had fled. As such he continued to be in the French state of affairs, and his own desire to return to his family being very strong, Mr. Tarver gave up his situation, and in less than a week rejoined his mother. He soon sought and obtained employment as a French master; first at the grammar-school at Macaeleigh in Hampshire, where he continued to live till 1826, when he was appointed French master to Etos school, which situation he held till his death April 15th, 1851, aged sixty-one.

Besides having written several elementary works, now used at Etos and other schools, he published while at Macaeleigh a 'Dictionary of French Verbs, showing their Government and Peculiarities.' During his resi- dence at Windsor he wrote his translation of the 'Inferno' of Dante in 4to; and subsequently 'Lectures on French History,' 'Paris, Ancient and Modern,' and some minor works. He also revised the grammars of Wannstedt and Liezice, and Nugent's 'Pocket French and English Dictionary.' For the last ten years of his life he was engaged on his 'Phrasological French and English Dictionary,' an original work of immense labour, and which has given to its author a high place amongst those who have most distinguished them- selves in phrasological studies. TASMANIA. A full description of this colony, formerly more generally known as Van Diemen's Land, will be found in vol. xxxiv. The following gives the material alterations that have taken place.

December 1847 had increased to 70,164, of whom 47,828 were males and 22,336 females. Of this total 33,173 were either free emigrants, or were born in the colony; the rest were then or had been convicts. Emigration to Victoria colony has combined with other causes to prevent the immigration of people to Tasmania. On Dec. 31, 1855, it was only 69,962, of whom 7740 were convicts, although 10,887 emigrants had arrived during the year. The greater part merely made it the place of transit, but many of the old settlers must also have left.

Notwithstanding this drawback the colony is highly prosperous, and its trade and commerce have been continu- ally expanding. The efforts of the local government are rapidly extending improvements over the island. Among the greatest works is a bridge over the Derwent, on the high road from Hobart Town to Launceston; it is of wood, and has 20 bays, or arches, of 32 feet span each.

The exports to Great Britain in 1853 included 5,514,756lbs. of wool (the average quantity for four years, 1849-52, had been upwards of 5,000,000 lbs.); 3996 hides (the average number for the previous four years had been about 500,000); 776 cwt. tallow; 42,000 cwt. of mutton and pork; 400 tons spermaceti, and 440 tons spermaceti oil. The declared value of the imports of British produce and manufactures from Great Britain in 1853 was 1,408,927l., the average for the preceding four years being only about 420,000l. Of foreign and colonial produce, chiefly spirit, wine, and tobacco, imported from Great Britain, the declared value for 1853 was 694,790l.

The number of sailing vessels entered as belonging to Van Diemen's Land on December 31st, 1854, was, Hobart Town, 519; Launceston, 214; and Port Philip, 402 tons aggregate. Of steam-vessels, 6, of 510 tons aggregate burden, were entered at Hobart Town, and 2 of 336 tons at Launceston. In 1854 the value of the imports was 2,604,680l., of which 1,516,604l. was of British produce; the exports amounted to 1,435,021l., consisting chiefly of wool, oil, timber, cattle, flour, and grain. The extent of land under cultivation was 127,732 acres, of which 49,920 were of wheat, and 35,320 of oats; while the sheep numbered 1,631,306, the cattle 64,000, and the horses 13,200. The value of land was 22,258. The land revenue had amounted to 112,225l.

Hobart Town, the capital of the colony, is built upon an undulating surface, on the left bank of the river Derwent. The streets are of good width, and laid out on a regular plan, and the government buildings are handsome. Some improvements have been made of late years, particu- larly in the construction of a new market-place in the town, and of docks and wharves at the river-side. Several of the public buildings are handsome. A small river which runs through the town, affords a supply of fresh-water. The
population on December 31st, 1847, was 21,467, of whom 3569 were foreign born.

Launcestown, the second town of the colony, is situated at the confluence of the North Esk and South Esk, which there form the Tamar, 45 miles from its outfall in Bass's Strait. It is 124 miles N. by W. from Hobart Town. Launcestown contains a hospital, a court house, jail, barracks, and other public buildings, and several places of worship. Convenient wharves have been constructed. The population in 1847 was 10,100. The shipping trade is important. A good highway extends from Hobart Town to Launcestown, and there are inns along it at short distances from each other.

Richmond is situated on the Coal River, about 12 miles N.E. from Hobart Town, and contains a population of 6300. Launceston, on the Tamar River, 20 miles from Hobart Town, is a small town in the rural deanery of Longford, with a population of 968.

Tasmania is divided into 19 police districts, and each of the districts generally contains a town or village of the same name. Lincoln, Perth, and George Town at Port Dalrymple, are places of some importance. They are seated on the Tamar, or the Macquarie, as it is called in the upper part of its course.

Government.—Tasmania is administered, under the 13 & 14 Vict., cap. 59, by a Lieutenant-Governor, who is appointed by the Governor-General in Council, of whom two-thirds are elected and one-third nominated. The judicature consists of a supreme court, courts of quarter sessions, and courts of requests.

Launcestown was appointed in 1842, whose diocese includes the whole island and its dependencies, and is divided into the archdeaconry of Hobart Town, containing 34 places of worship, and the rural deanery of Longford, containing 19 places of worship. There are also 13 places of worship of the Church of England, 9 of Roman Catholics, 21 for Wesleyan Methodists, 15 for Independents, 3 for Baptists, and 2 for Jews. Of these bodies all except the Independents and Jews receive government aid. There are numerous private schools in Hobart Town and Launceston. The schools, under Government control, are taught by government-paid and appointed pastors, and which it may be noticed is in a remarkably ugly part of the country. It is in particular destitute of trees. "King Olof, the tree-feller, a nasi well known in Swedish history, took his pleasure there; it has been remarked, "with axe and fire, and the trees have not grown again for a thousand years." In February, 1792, when Esais was in his tenth year, his father died, leaving a widow and six children, four sons and two daughters. His mother cast herself into the arms of a parish-priest, who was a remarkable character. She was highly respected for diligence and piety. His wife, whose maiden name was Seidellin, was noted for her courage and her talents, which she sometimes exercised in writing verses. The poet grew up till his tenth year at a school, and was a remarkable boy, a remarkable poet, and an appointed pastor, and which it may be noticed is in a remarkably ugly part of the country. It is in particular destitute of trees. "King Olof, the tree-feller, a nasi well known in Swedish history, took his pleasure there; it has been remarked, "with axe and fire, and the trees have not grown again for a thousand years." In February, 1792, when Esais was in his tenth year, his father died, leaving a widow and six children, four sons and two daughters. His mother cast herself into the arms of a parish-priest, who was a remarkable character. She was highly respected for diligence and piety. His wife, whose maiden name was Seidellin, was noted for her courage and her talents, which she sometimes exercised in writing verses. The poet grew up till his tenth year at a school, and was a remarkable boy, a remarkable poet, and
and aptitude for learning, was smitten with the thought that he was degrading him out of his proper sphere; and one starry night, when, as he was driving home with him from a tax-collecting expedition, he turned the conversation on the heavenly bodies, the boy, then aged thirteen, who had just been reading Bastholm's 'Philosophy for the Unlearned,' discoursed with fluency of things which Branting had never heard of, this feeling became too strong to be kept under. Lars Gustaf, the elder brother, was then a tax-collecting officer with nine children. Branting wrote off to the captain in March, 1798, to say that he felt it a sin to keep such a boy as Essaias from study, and to propose that he should take him as a secretary, and be under the instructions of his elder brother. Löwenjelm at once consented, and the whole course of the young poet's life was changed. 'I now began,' he says in an autobiographical notice, written in after-life, 'to study Latin; the method adopted was the old and sound, and, in my opinion, the only right one, which may indeed seem tedious and tiresome, but in the end, by the greater certainty it gives, spares time instead of wasting it.' He stated that he began French and English at the same time—French in Torneträsk and English in Stockholm—and that he had received him: a letter written by him in 1793, which was afterwards found, showed that at the age of ten he was already studying Latin and French at Milleröd. Ossian's Poems, he continued, he read for about a year English without any assistance. A door is still shown at Malma, the residence of Captain Löwenjelm, which bears the marks of the iron rod with which Tegnér used to thrust at it; when enthusiastically shouting out in English one of his verses, as if he were regarded so 'The spirit of Connal is keen!' In the next year the services of Lars were transferred to the family of Christopher Myrman, an iron-master at Nären, near Filipstad, who made some of the best iron in Sweden, and was a man of learning as well as a man of business. At least, he bore a stipulation that his brother should accompany him, and they both soon became almost members of the family. Myrman had eight sons and four daughters: Lars was tutor of the eldest four sons; and his brother was in charge of three of the others, and the lover of one of the daughters, whom he married some years later.

At Råmen they found an excellent library in the classical languages, and a good collection of Swedish, French, and English books, but not a single German book; it was at the period before the introduction of German literature into Sweden. Of Shakspere, however, there was only 'Hamlet,' 'which strange to say, remarks Tegnér, 'interested me very little. It requires, however, a ripper age the theme to appreciate it fully, and I was not yet acquainted with Homer. According to his own recollections afterwards, he in seven months after commencing the study of Greek, had read the 'Iliad' three times through and the 'Odyssey' twice, and was able to make out the sense of Ovid and Latin. 'It seemed to those around him,' says Böttiger, in his biography, 'as if he had been born with the foreign languages in his brain, and it only needed a gentle shake to wake the slumberers in life.' He made himself at the same time a proficient in chess and skittles. Often when the girl came to light his fire in the morning she found him still with his clothes on continuing the studies he had pursued all night. In 1799, when he went with his three pupils to the University of Lund, he passed such an examination, that he was recommended to become a candidate for a degree. His wish of means became however at this time so pressing, though he was supported by contributions from Branting and Myrman, that he resolved to relinquish a learned career; but a life of Amacon which he wrote in classical Latin, led Professor Norberg to advise him and apparently to assist him to continue the struggle. For some time he studied eighteen or twenty hours a day; he made proficiency in mathematics, as well as in other studies, but the business of the family seemed to him a burden for learning, he became remarkable for the awkwardness, reserve, and rusticity of his manners. A post as under librarian, and afterwards that of assistant-teacher of mathematics, he accepted; and finally, in 1806, he was enabled to marry, and Anna Myrman became his partner for life. Then a change took place, which was extraordinary, strange, and sudden. Immediately after his marriage he became all at once as fond of company as he had been oneself to it, lively, open, and full of spirits to an extreme, which seems on many occasions to have led him to objectionable levity. The wit of the Greek professor at Lund was often censured as passing the bounds of decorum. This professorship was confided on him almost by right, when, in 1812, a separate professorship of Greek was first established at Lund. Together with the professorship he received the living of Staffe, which obliged him to take holy orders, and for the next twelve years of his life he lived in the deanery of Staffe, dealing with the Latin and in the cultivation of poetry, which he had commenced some time before, but which he prosecuted during this time with such success that he was finally hailed by common consent the first living poet of Sweden and its rising bard.

His first public appearance in verse, which attracted any attention, was on a melancholy occasion— the loss of his brother Lars Gustaf, who died in 1802. His elegy on that event was inserted in the 'Transactions' of the Literary Society of Gotenburg, from which it received some sort of prize. It was in 1808 however when there was an alarm of invasion that he suddenly burst forth as a poet of the first order, by his 'War-Song of the Scanian Land-Defenders,' 'Local Militia.' This warlike dithyrambic," says Böttiger. 'would never have been heard from the Swedish lyre. The electric lines ran like wildfire through the kingdom, bearing testimony that the poet had sung in the same degree as his ancestors sung in Sparta.' In 1811 another patriotic poem entitled 'Frigio,' won the prize of the Swedish Academy; it was a spirited outburst of indignation at the degeneracy of the modern Swedes, compared with their ancestors, whose swords naturally belong to the anti-classical party, excited some surprise by his undertaking the defence of Leonidas, which he afterwards followed up by dedicating to him his poem of 'Axel.' His consecration as a priest in 1812 gave occasion to a poem on that subject, which was afterwards surpassed by a poem of the same kind, his 'Nattvarslarbornen,' or children of the Lord's Saver, a sort of religious idyl, in 1820. In the same year, 1820, some cantos of his 'Frichtio Saga,' a romantic tale of ancient Scandinavian, appeared in the 'Iduna,' a periodical published by the Gothic Society, of which Geijer [Geijer, S. 2] was the leading spirit, and which was well acquainted in the country before either of them emerged into fame. His reputation was enhanced in 1821 by the publication of 'Axel,' a brief poetic romance, still thought by many the fairest of all his works. The point in 1825, by the completion of 'Frichtio Saga,' which became at once the most popular poem that ever appeared in Sweden. From the period of the publication of 'Axel,' if not before, the name of Tegnér was recognized as that of the undisputed head of Swedish poetry.

This period of Tegnér's life was brought to a close by an unexpected, and at least at the outset, an unwelcome event. In 1824 he received the intelligence that the clergy of the diocese of Vymo had presented his name to the king as candidate of the three whose fate it was to fill the bishopric, and that the king had been pleased to select him for that office. As a clergyman he had not been remarkable for gravity of demeanour, and the general impression was that an excellent Greek professor was confided on a bishopric whose priest would now be turned into a very indifferent bishop. These expectations were disappointed. From the time of Tegnér's appointment his life took a different course. He ceased to appear as a poet, and gave himself up to the duties of his office. It brought him the personal loss of a large part of its revenues, in which his early experience with Branting was said to be found of use. Almost the only unepiscopal episode we hear of for some years is on that memorable day in 1829 when he met with Dr. Böckh [Boekh, S. 2] and von Schleicher [Oelenschlager, S. 2]. He gave himself up to theological studies, and was found in his study "walled up with fathers of the church and biblical commentators." Thirty-one new churches were built in his diocese during
his episcopate. At the dioceses which he attended he was distinguished for his conservative principles and his opposition to what he called 'Radicalism,' at the time when his old friend, Mr. Wilberforce, was so actively engaged in the same way, suddenly broke with the conservative party, on account of its propensity to carry reaction too far. His old liveliness was still to be found in his private letters. In the Diet of 1831, financial affairs were again convoked to a friend of his being bilious and unwell, so unwell, he said, that he was as little able to comprehend financial affairs as a member of the Bank committee. "As for biliousness," he added, "it is unnecessary to carry that which is a peculiarity of constitution in the body, and in life to belong to the order of the day." Tegnér was still looked upon with such favour by his order, that in 1839 he was one of the three candidates proposed for the archbishopric of Upsal. Next year, alas! he was the inmate of a lunatic asylum. "God preserve my understanding," he said, written shortly before in a letter to one of his friends; "there runs a vein of madness in my family. With me it has hitherto broken out in poetry, which is a milder kind of madness, but who can give me the assurance, that it will always take that way?" A seclusion of some months in an institution for the insane at Schlisselburg enabled him to return in 1841 to his family, and partially to his duties, and the he was even able to preach so lately as June, 1846, and at的形象 passed on, and left behind chills his house and his room. He lay on the sofa, in cheerful spirits, and passed his time in reading. "About him," says Böttiger, "was generally seen a pile of books of different authors, from the old school to the new; a fashionable novel, but some volumes of Arlöst and Walter Scott were never wanting." After a stroke of paralysis and still weakened health, he died without pain on the 2nd of November 1846, shortly before midnight and during a beautiful appearance of the northern lights. He was survived him, and he left six children, one of whom, a daughter, is married to Professor Böttiger of Upsal. Böttiger is himself a poet, and one of his best-known poems is "A little induced to enter the Bay of Naples, where having been interested by witnessing the emotions which a stranger evoked over a book he was reading, and afterwards finding the book lying where the stranger had left it, he took it up and found it was 'Frithiofs Saga.' Tegnér, as we have seen, had lost his father in 1792; his mother survived till 1836, when she died at the age of ninety. In 1822, when the king of Sweden, Bernadotte, was returning from a visit to Norway, he met Tegnér's mother, living in a village he was passing through. She told him that her son had told her that she had given birth to a son of whom she and Sweden might be proud. The mother of such a son however had passed most of her life in anxiously tending on another son, who died. The son, who had been unguardedly walked into a river and was drowned. The works of Tegnér were collected and published in eight volumes by his son-in-law Professor Böttiger (Stockholm, 1847-50). Nearly three of the volumes are occupied by his smaller poems, two by prose works, chiefly speeches, and extracts from letters, and a volume and a half by the larger poems, on which the reputation of Tegnér is chiefly founded, and by a biography of the poet, from which we have taken most of our details. The smaller poems are many of them occasional verses on subjects of slight importance, but some are vigorous and interesting. One of his earliest is on 'Pitt and Nelson,' both of whom are objects of strong condemnation, Nelson being called 'the Tamerlane of the Seas;' another, remarkably well written, is a dialogue between England and France, vituperating each other, in which England has decidedly the worst of the fray. The sympathies of Tegnér seem to have been extremely limited; his conduct for Germans and Germans is repeatedly expressed, and it would be difficult to find in his writings praise of any country but his own, which, except for a tour for health to Carlabad in 1833, was the only one he had seen, or apparently ever wished to see. In one of his letters he even in derision of Stockholm as that hateful object a "large small town." His speeches are in great reputation both in Sweden and Germany for their lucidity and eloquence. They were chiefly delivered in the University-schools and on similar occasions, and are of much the same character as those delivered in England and America at mechanics institutes, &c., and bearing on the same class of subjects—the benefits of education, the utility of particular studies, &c. Of the larger poems, 'Frithiof,' 'Axel,' and the 'Children of the Lord's Sapper,' the English reader will find opportunity of forming almost as good a judgment as the Swedish. No foreign poet has been so fortunate as Tegnér in his English translators. Of 'Frithiof' there are at least five versions, more in number than we have of any other foreign poet of this century, and several of them are good. The first, by the Rev. William Strong, published in 1835, is undoubtedly the worst, but is still the work of a man of learning, and an enthusiastic for his original; an admirable version of 'Axel' is that of Charles G. Stephens, now Professor of English at the University of Copenhagen, was issued at Stockholm in 1841, and accompanied by a letter from Tegnér to say that he thought it the best English translation of himself he had seen; a fifth, by Oscar Baker, in 1841, possesses considerable merit. It is possible that the English reader, on the perusal of some of these, may arrive at the opinion that the 'Frithiofs Saga' has been considerably overrated. The same conviction has been arrived at by several English readers, among others the critic of 'The Athenaeum'. In 1836, the English version of 'Frithiof' has no deep paths, no vivid eloquence. Its general character is that of neatness and prettiness rather than anything superior. It sinks often into tamed nonsense, and its language is not up to the level of the original, and follows too closely the original saga, is that of a young Northern warrior who is enamoured of the sister of two young kings, who is denied her hand by her brothers, who, in his indignant proceedings thereupon, accidentally burns the sacred grove of Balder, and in a sort of humbly expiated the sacrilege against Balder of which he has been guilty. This story is told in four-and-twenty cantos, of which some are as short as ballads, and each one is in a different measure, one in blank verse, another in hexameters, &c. That as epic poem would be improved by a variety of metre, was a proposition laid down long ago by Dr. Watts, if not before him; but this mechanical variety of four-and-twenty different metres, not one repeated, has somewhat of a childish appearance. Tegnér's poem of 'Axel' is in what may be called the Byronic metre, and in tone and structure strongly reminds the reader of Byron's 'Mazepe,' or it was doubtless modelled. The story is slight and commonplace—a maiden who follows her lover to the war in man attire, and whose unhappy husband combats her lover distracted—but the spirit with which it is told atones for every deficiency. Those who are fond of 'Mazepe' are sure to like this poem, either in the original, or its excellent English translation by R. G. Latham. There are two others, one by Oscar Baker, who has also rendered various passages from 'Frithiof' and 'Axel.'

TEID.E, a family of Saurian Reptiles. [Saurians]. The following is a synopsis of the genera:—

A. Ventral shields small, long, smooth. Tongue contractile.

1. Teius.—Toes 5-5. Femoral pores distinct. Two species.

2. Calodactylus.—Femoral pores none. Toes 5-5. One species.

B. Ventral shields broad, smooth.

Tongue elongate, sheathed at the base. Teeth compressed.

** Tongue not sheathed, free at the base.

5. *Diceros.*—Teeth compressed transversely, bифil.
7. *Acanthophya.*—Scales of back large, of sides granular.
10. *Crocodilus.*—Scales of back equal, similar. One species.

This family is well-illustrated by the *Teine Teguexis* of the British Museum Catalogue. It is the *Lacerta Teguexis*, Linn.; *Variegata Lizard*, Shaw; *Great American Safeguard*, Griffith's Cuvier.

The warm countries of America are the native places of the family. In some of that continent they are no less remarkable for being as much as $4$ or $5$ feet in length. Messrs. Duméréil and Bibron state that they ordinarily inhabit the fields and the borders of woods, although they never climb trees; but they also appear to frequent sandy, and consequently arid tracts, where they are said to excavate burrows, in which they lay themselves up for the winter. When, in their flight to avoid pursuit, they come upon a lake, pond, or river, they plung into it, according to *D'Azara,* to escape from the danger which menaces them, and do not leave the water till all fear of danger is past. These Lizards, observe Messrs. Duméréil and Bibron, have not, indeed, webbed feet; but their long and slightly compressed tail becomes, without doubt, under such circumstances, a sort of oar, of which they well avail themselves. *D'Azara* states that they feed on fruits and insects, and that they also eat serpents, toads, young chicks, and egges. He also relates that they are fond of honey; and that in order to procure it without fear of the bees, they come forward at intervals to the honeycomb, give the hive a blow with their tail, till by repeated attacks they weary out the industrious insects, and drive them from their home. For figure of the Variegated Lizard, see plate 2.

**TENANT AND LANDLORD.**

The provisions of the statutes 4 Geo. II., c. 28, and 11 Geo. II., c. 19, and 57 Geo. III., c. 62, have been superseded by those of the Common Law Procedure Act, 1852; the landlord's remedy remains, however the same, the procedure alone is altered. [Erratum, S. 2.]

Besides the remedy given to landlords in certain cases by the statute 1 & 2 Vict., c. 74, another equally summary method of recovering possession of premises when they are held over by a tenant, is afforded by the action of ejectment, provided in the County Court. This tribunal may be applied to whenever the rent or value of the premises does not exceed 60L, and no fine has been paid.

**COUNTY COURTS, S. 2.**

**TENNYSON WILLIAM,** was born in 1785 at the little fishing-town of Easter Anstruther, in the County of Fife, Scotland, and was educated in the town-school, where he had for a fellow-student the afterwards celebrated Dr. Chalmers. In 1799 he was sent to the University of St. Andrews, where he obtained a knowledge of a taste for the classical languages from the instruction and lectures of Dr. Hill and Dr. Hunter, but circumstances prevented his continuation for more than two sessions. At an early period he showed a tendency to his feet, and could only move by the assistance of crutches. He was thus precluded from most active employments, and in 1801 he became clerk to his brother, who carried on the business of a corn-factor at Glasgow, whence he subsequently removed to Anstruther. Whilst in this situation he most zealously prosecuted his studies. He made himself acquainted with the best classics in verse and prose; with Ariosto, Camoens, and Wieland, in modern languages; and with Hebrew nearly all of which was accomplished by his own unaided efforts. His wife, a lady of strong intellect and deeply religious character, was extremely nut and painfully aware of approaching commercial embarrassments, he wrote, and published anonymously in 1812, in his own little town his chief poem, 'Anster Fair.' It is a luminous and humorous tale, adopting Maggie Laugher for its heroine, describing in a simple manner the manners, customs, and vanities of the inhabitants of Anstruther and Fair. It is a pleasant and instructive picture of the social state in the country, and it was published shortly after the death of Lord Byron, whose example was quickly followed by others.

The poem made but little way with the public at first, indeed it was hardly made known; but it attracted the attention and praise of J. F. Tytler, Lord Woodhouselee, and in 1814 a highly favourable review of it appeared in the Edinburgh Review. From the pen of Mr. Jeffrey. In his own narrow circle, however, it had made an impression in his favour, and probably assisted in procuring him the appointment in the autumn of 1813, of parish schoolmaster of Dumino, a rural upland district between Anstruther and St. Andrews, of which the income was about 40L a year. While residing here, with the assistance of books from the library of the neighbouring university, he made himself acquainted with the masters of the modern languages, and the poets of ancient and modern languages. In 1816 he was removed to a school at Lasawade, a pleasant village near Edinburgh, with a larger salary, affording him an easy opportunity of becoming known to the most eminent literary men of that country. He was elected a seat in the General Assembly of the Presbyterians in 1817, and in 1819 was elected teacher of the classical and oriental languages in the institution founded under the will of Mr. M'Nab for promoting education at Dollar in Clackmannan-shire. Here he continued till the beginning of 1833, when he succeeded the Rev. Andrew Grant as teacher of Oriental languages at St. Mary's College, St. Andrews. At St. Andrews, where the university session extends from early in November to the end of May, he henceforward passed his winters, while the summers were spent at a little villa called Devon Grove, near Dollar. His leisure was employed in compiling grammars of the Syriac and Chaldean languages, published in 1840. His other works were—

'The Thanes of Fife,' 1822; 'Cardinal Beaton,' a tragedy, 1833, and 'John Balliol,' a drama, 1822, both the prose, though not ranking high as dramas, displaying much poetical power, with considerable originality; 'The Dying Down of the Cathedral,' [of St. Andrews], a descriptive poem in the Scottish dialect; 'Hebrew Drama, founded on Bible History,' 1849; 'Reminiscences of Israel,' prefixed to an edition of the 'Gentle Shepherd,' not published till 1852 at New York. Another little production deserves to be mentioned, as showing the cheerfulness of mind and the goodness of his humour, 'The Anster Concert,' a small pamphlet of 12 pages, published at Cupar, in Jan. 1811, purports to be by W. Crookley, and preceded by some months the publication of his 'Anster Fair.' It is in the Scottish dialect, with motives on the title-page in Hebrew, Greek, Latin, and English, and pleasantly alludes to the peculiarities of the inhabitants of Anstruther, as well as to his own condition. He also wrote some miscellaneous poems, including translations from the Persian, Greek, and German, of which an average merit is indicated by the fact that it was published in the 16th of February, 1848, at his house near Dollar.

**TERBIUM. [CHEMISTRY, S. 1.]**

**TEROFIUM. [CHEMISTRY, S. 2.]**

**TERICOLLA. [ANNEZLDA.]**

**TESTUDINARIA, a genus of Dicotyledonous Plants, belonging to the natural order Diocococcae.**

* T. Elephas. The Elephant's-Foot Plant, is well known in our collections of plants from its curious truncate rootstock, looking like the upper end of a trunk with a soft corky bark, which is split so as to give it a rough character. From the top of this thick mass a climbing stem is sent, which bears the leaves and flowers. Like perennials, the top of the rootstock dies down, and the regeneration of the plant is seen in most Exocogonous Plants.

**TETRAONYX. [TORTOISES.]**

**TEXAS,** one of the United States of North America, lies between 26° and 30° 30' N. lat., 93° 30' and 106° W. long. It is bounded by the state of Louisiana; N.B. by that
TEX

TEX

of Arkansas; N by the Indian Territory, W by the Territory of New Mexico, S.W. by the Republic of Mexico; and S by the Gulf of Mexico. Its greatest length from north to south is 700 miles; its greatest width from east to west, 800 miles. The area is 274,356 square miles. The population in 1860 was 212,592 (of whom 58,101 were slaves), or 2.84 per square mile. This, according to the present ratio of representation, entitles the state to send two representatives to Congress, to the Senate, like each of the other United States, Texas sends two members.

Surface, Hydrography, &c.—The surface of so vast a country is not very regularly varied, but it may be broadly described as comprising a low and level region, an undulating or prairie tract, and a hilly or mountainous district, answering generally to what have been called Southern, Eastern, Middle, and Western Texas.

The level region occupies the entire coast, and reaches 60 or 80 miles into the interior. For 10 or 12 miles inland the country is subject to inundation, but behind this swampy tract it rises imperceptibly for some miles, and then straitens out into a plain with a nearly level surface.

This plain is from 10 to 30 feet above the water-courses, and with the exception of the low bottoms along the banks of the rivers, it is not subject to inundation. The trade, therefore, ascends the rivers to the distance of 45 or 50 miles from the sea in a straight line. The whole of the plain is wooded, with the exception of the highest tracts of land between the rivers, which are destitute of trees, and exhibit fine prairies. The forest consists of different kinds of oak, hickory, iron-wood, sugar-maple, and other useful trees, which are found in the southern states of the American Union. The whole of this tract is in process of conversion into an immense field, producing cotton, maize, wheat, tobacco, and every kind of plant which grows in parts of the country, on the borders of the tropics; the sugar-cane flourish here, but is not much cultivated.

The undulating country at the back of this plain, though naturally less fertile, has a more genial and healthy climate, and with moderate culture appears capable of producing almost unlimited supplies of corn, cotton, and tobacco, while the uplands afford vast and excellent grazing-grounds, being covered with grass, which maintains its verdure during months. This is the most productive portion of the state. The country between the river-bottoms generally rises from them with a gentle acclivity to an elevation of 200 to 400 feet, and presents for the most part an undulating surface. The isolated masses of moderate elevation are dispersed. By far the greatest part of this tract is destitute of trees, which occur only in isolated clumps about the bases and declivities of the hills, and at considerable distances from one another.

Western Texas, the hilly and mountainous district, includes the southern portion of the Sierra Sacramento, and a nearly parallel range on the east called the Guadalupe Mountains. This region is little known, being as yet left to the Indian tribes, chiefly Cunanches, to the wild animals, and to the hunter. Many of the mountains are believed to rise more than 2000 feet above their bases. Most of the rivers of Texas have their origin in the mountain region, and American writers speculate freely on whether the waters have a return to the sea when the 'water-power' is fairly turned to account.

Texas owes much of its great capacity for agricultural purposes to its numerous rivers and the regularity of their course. Nearly all the rivers, even those which run only 50 miles, are navigable. Many of the rivers do not include their course. The most remarkable of these rivers from west to east are—the Rio Grande, noticed under Mexico, between which country and Texas it forms the boundary; the Rio Parra, observed along about the south-eastern course; the San Antonio; the Rio Guadalupe, which falls into a lagune forming the harbour of Espiritu Santo; the Colorado, or Red River of Texas, which enters in its upper course the mountain tract of San Sabo, at the head of a lake, and descends into a lagune constituting the harbour of Matagorda; the Rio Brazos or Brazos de Dios, whose origin is near to that of the Red River, and which, flowing chiefly in a south-south-east direction, nearly reaches the centre of Texas, and enters the most fertile districts, and turns towards a course of about 400 miles, and the Rio Trinidad, which, after a course of more than 300 miles in a south-south-east direction through a very fertile tract, falls into Galveston Bay. Red River and Sabine River, which separate Texas from the Indian territory and Louisiana, are noticed under Louisiana. The Sabine has a length of 350 miles, and is navigable for 150 miles, and much higher, by keel-boats. Before reaching the gulf it expands into a lake 40 miles in length and 12 in breadth. The bar at its mouth has 4 feet of water over it at low tide.

There are several good harbours along the coast. The low coast is skirted by a number of flat islands, separated by narrow channels from the sea. These are deeper than those farther south, and afford in several places good anchorage for vessels of moderate burden. The bar at the mouths of the rivers have tolerably deep water on them, and there is no part of the extensive Gulf of Mexico which has more or better harbours, bays, and inlets than those of Texas. There are no lakes of any importance in the state; and no canals have yet been constructed.

A southern Pacific railway is to cross Texas from east to west, and several other railways are projected, but none have been begun. The roads for ordinary travel are many of them well laid out, and in good condition.

Geology, Mineralogy, &c.—The geological features of Texas are very diversified. The lower part of the country consists chiefly of igneous and metamorphic rocks. In the eastern portion of this district a considerable belt of Lower Silurian strata has been observed. North of this along the Sabine River, carboniferous strata occur. Much of the centre and north of the state is occupied by a cretaceous system of rocks; while the whole of the level region, and the low districts bordering the Gulf of Mexico, consist of tertiary and recent deposits.

In minerals the state is believed to be very rich. Gold has been found in several of the smaller streams of the western portion of the mountain district. Silver also occurs in the hill country, and the silver mine of Saba is said to have been one of the richest in America during the Spanish occupation. Iron ore appears to be very widely diffused. Lead and copper have also been found in several places. Coal occurs on the Trinidad and Brazos rivers. Alum is obtained in two or three places. Salt occurs very extensively in salt springs and lagunes; large quantities are found on a salt lake near the Rio Grande. Potash and soda are also obtained in dry seasons near the salt lagunes. Asphaltum is obtained on the coast. From the limestone of the prairie country abundance of lime is produced, and the soil of the eastern part of the state, may be quarried through a large portion of the state. The white stone, which becomes quite hard on exposure to the atmosphere, and is very useful for building purposes, is found in several places along the eastern side of the hill country. Agate, chalcedony, and jasper, are abundant. Saline, white and blue sulphur, and other mineral springs, said to possess considerable curative properties, are very numerous.

Climate, Productions, &c.—The temperature varies according to the locality, from tropical to temperate; yet, except along parts of the coast and the rivers where subject to inundations, the climate is said to be generally pleasant and salubrious—in some places eminently so. The summer is short and cool, and refreshing. Snow is rare, and is completely unbroken from the south. In winter, ice is seldom seen, except in the northern part of the state. Texas has periodic winds: from March to November they are from the south, and little rain falls; the rest of the year northerly winds prevail, and in December and January they are strong and keen.

The characteristics of the soil and productions have been noticed in speaking of the surface of the country. Cotton, as a staple crop, has gained a great growth; it generally grows well and of good quality; that growing along the coast is said to be little inferior to the celebrated Georgians Sea Island cotton. Tobacco also thrives well, and is becoming an important product of the state. The sugar-cane is extensively cultivated; and the manioc, or cassava, has attracted the notice of the Texan farmer. All the cereals produce abundant crops. Rape is the chief grain staple: two
Austin City, the capital, is situated on the left bank of the Rio Colorado, in 30° 28' N. lat., 97° 45' W. long.; 1 population 2309. It is merely a village, but it contains the state buildings, and supports two weekly newspapers.

Galveston, a city and port of entry, and the capital of Galveston county, is situated near the east end of Galveston island, about 200 miles S.E. from Austin City; population, 4177. The harbour of Galveston is the best in Texas, and six-sevenths of the state's produce and about 20 per cent of the trade of Galveston is very considerable, and is steadily increasing. A regular line of communication by steam-ships is maintained with New Orleans. There are a few good public buildings in the city, and numerous warehouses, hotels, &c. Galveston has a good harbour, and about two miles wide. It was once a favorite lurking place for pirates, but is now thoroughly cultivated, and the residence of several wealthy farmers. During summer it is much resorted to by visitors.

Houston stands at the head of steam-navigation on Buffalo bayou, 160 miles S.E. from Austin City; population, 2396. Next to Galveston, Houston is the chief business town in the state, being the centre of a rich cotton district. There are several public buildings, churches, and schools. A wharf 500 feet long, with a cotton press at each end, extends along the front of the city.

San Antonio, near the sources of the river of the same name, 75 miles S.E. by S. from Austin City, population 3448, is the chief city of the Texas Spanish settlements in South Texas. It contains several ecclesiastical edifices erected during the Spanish occupation, a large ruinous fortress, and other vestiges of its former possessors; also a United States military post. Population, 6300.

History, Government, &c.—Until 1836 Texas formed a part of Mexico. For some years prior to that date the American colonists, an active, numerous, and united body, had been making every possible effort to prepare the way for a revolt against the Mexican government. The hostility commenced in earnest. The Mexican government was unable to suppress the rising; and eventually the Mexican army, under General Santa Anna, the president of Mexico, was defeated at San Jacinto by the Texans, under the command of General Houston. Santa Anna was made a prisoner, and, as a condition of his release, agreed to sign a treaty acknowledging the independence of Texas. The Mexican senate disavowed the authority of Santa Anna to make such a treaty, but the terms were taken to Mexico effecting a re-conquest of Texas; and in 1845 the United States of North America formally admitted Texas into the Union as a sovereign state. This led at once to war between Mexico and the United States; but the former country was soon disorganised. The Mexican army was defeated and the minister of war was assassinated. The Mexican government was unable to suppress the rising; and, after suffering a series of humiliating defeats, was constrained to accept peace on terms of acknowledging the independence of Texas, and ceding to the United States a large portion of territory, including the Rio Grande valley.

The constitution was adopted in August, and ratified in October, 1846. By it the right of voting is vested in every free white male citizen who shall have resided in the state for one year. The legislature consists of a Senate of not less than 19 nor more than 33 (at present 21) members, who are elected for four years; and a House of Representatives, of not less than 45 nor more than 90 (at present 66) members, who are elected for two years. The governor is elected for two years. The state is divided into 25 counties. The revenue for the year ending October 1857, was $1,544,094 dollars, and the expenditure the same. The state militia is composed of about 15,000 men and 1248 commissioned officers. In 1860 there were in the state two colleges, having 800 students, and 2494 public schools, having 360 teachers and 7946 scholars. (Gazetteers of the United States; Official Reports relating to Texas, &c.; Seventh Census of the United States; American Almanac, 1847, Baltimore, &c.)

THALARGOS. [Bear.]

THALLOGENS, a class of Plants proposed by Lindley for those Flowerless Plants which are distinguished by the absence of an axial stem. It includes all the Cryptophytes, with the exceptions of the Cercopita and catenulatae.

THEIN. [CHEMISTRY, 8. 1.]

THENARD, LOUIS-JACQUES, BARON, a distinguished French chemist, was born at Nogent-sur-Seine on the 4th of May, 1777. He went to Paris early in life, and became

The text is a historical account of Texas, mentioning its major cities, their populations, and the events leading up to the country's admission into the United States. It provides details about the state's constitution, legislature, and education system.
A pupil of Vauquelin. He devoted himself with so much zeal and success to the study of chemistry that when he was only twenty years old he was appointed demonstrator of chemistry in the Polytechnic School of Paris. By his unceasing activity and his great knowledge of his subject he was at last made professor of chemistry in the College of France and in the University. In 1824 he received the title of Baron on the occasion of the coronation of Charles X. In 1825 he was a member of the Legations and in the same year he was elevated to the dignity of a peer of France. In 1837 he resigned his professorship of chemistry in the Polytechnic School, and in 1840 he gave up his chair in the University of Paris. Baron Thenard was one of the most original chemists of the first half of the 19th century. His separate works however are not numerous. One of the best known of his literary productions he published in conjunction with M. Gay Lussac; it is entitled 'Recherches physiques et chimiques.' This work was published after the discovery of the metallic nature of soda and potash by Sir Humphry Davy. Numerous experiments on the subject of the action of the galvanic pile are recorded, and methods of obtaining potassium and sodium independent of galvanism are indicated. Other subjects of high scientific interest were discussed in this work, which served to give its authors the first position amongst experimental chemists. In 1813 M. Thenard commenced the publication of his 'Traité de Chimie élémentaire, théorique et pratique.' This work was intended to be an introduction to the science of chemistry and has gone through several editions and been translated into German; the last edition was published in France in five volumes in 1836. The great contributions of Thenard to the science are to be found in the scientific journals and transactions of scientific societies of his time. Of these there is a vast number, embracing the whole range of chemical science. There is indeed no branch of chemistry at which he did not labour, and there is no subject he has worked at which he has not shown considerable talent. He died in the month of June 1857, and was buried publicly in Paris on the 23rd of that month. For many years before his death Baron Thenard had withdrawn from all active chemical science, but he had never lost his deep interest in the development of the educational institutions of France. He was an administrator of the College of France and of the Faculty of Sciences, and vice-president for many years of the Superior Council of Public Instruction; and he has contributed more largely than any other individual since the death of Curvier to the development of the scientific institutions of France.

Therapeutics. Under this head it is proposed to give a complete list of one of the most important compounds that have been tried as an insensitizing drug, to the list of the 'Materia Medica' since the publication of the first Supplement to the 'Penny Cyclopedia.'

Anesthesia or Anaesthesia, the name of a genus of plants being mentioned in the medical order, Nymphalida, of which the plant yielding the Cocculus Indicus of commerce is now referred. It has the following characters: flowers diocious, calyx of 6 sepals in a double series with 2-closed pressed bracteoles, corolla none, stamens on separate flowers united into a central column, stellate at the apex: anthers numerous, covering the whole globose apex of the column. The flowers with pistils are not known, but the fruit is a 1- to 6-seeded drupe. The seed is globose, deeply excavated at the middle, oily, cotyledons imbricated.

The plant which yields the berries of commerce is the only species of this genus. It is a strong climbing shrub, and is met with on the coasts of Malabar and the Eastern Islands. It is called Anamirta Cocculus.

Anaesthesia, is the term applied to those agents, which, on being applied or administered to the human body produce either a local or general insensibility. Such agents act more especially on certain parts of the nervous system, depressing it both in quantity and quality, thereby impairing the power of communicating and perceiving impressions made upon its surface.

The state of anesthesia comes on in various forms of para-alytic disease, and as such has been known and described by medical writers. Anaesthesia can also be produced by artificial means, such as by some state of excitement brought on by what is called animal magnetism. In this state of the system the anesthesia is sometimes so perfect that surgical operations have been performed on persons whilst in perfectly unconsciousness. This was known previously to the general introduction of anesthetic agents during the performance of surgical operations generally. All narcotic medicines will produce conditions of anesthesia, in which surgical operations may be performed without pain. During the action of alcohol on the nervous system, it is frequently supposed that it renders the subject insensible without the knowledge of the patient. Although these circumstances have been generally known, it was not till about the year 1847 that any attempt was made to introduce it into surgical practice. The discovery was made during the performance of surgical operations. About this time two gentlemen in America, Drs. Morton and Jackson, made experiments on human beings with the nitrous oxide (laughing gas), and found that a state of insensibility could be produced under which surgical operations might be performed. The effects of this gas in producing excitation of the nervous system had been made known by the experiments of Sir Humphry Davy, and its peculiar action was often exhibited in the lecture-room of the chemist. It was also known that sulphuric ether produced similar effects on the human system. The merit, however, of the application of these remedies to the production of insensibility during the performance of surgical operations is due to Drs. Morton and Jackson. Having discovered that ether was much preferable for this purpose to nitrous oxide, they made known the important fact, that under the influence of this agent an insensibility might be produced under which persons might undergo the most severe operations with the least sensation. This discovery was made without injury to their health. This announcement was speedily made known, and in the course of a few months the facts were realised in all parts of the world. In the course of the year the same discovery was made and realised the most sanguine expectations. The action of ether, and the best method of administering its vapour, was investigated by Dr. John Snow, who, in September, 1849, published a work on the 'Inhalation of the Vapour of Ether.' After the successful introduction of ether it was found that other agents similarly constituted acted in the same way upon the human system. This subject was investigated with great success in Edinburgh, and a new agent - Chloroform, a terchloride of formaldehyde, acted more speedily and efficaciously than even ether. From this time chloroform became more generally used, and is now the substance which is generally employed for the production of artificial anesthesia. After this Dr. Snow found that amylene was capable of producing the same effects as chloroform. Whilst Dr. Richardson has shown from experiments on living animals that the dust of the common puff-ball, Lycopodium fumigatum, which had been used by the alchemists as the basis of their phials, had also the property of producing insensibility.

These agents appear to act entirely through the nervous system, and according to the time employed in their administration the effect may be local or general. The first part of the nervous system which appears to be affected is the brain, and a kind of intoxication comes on in which the patient is excited, the intellectual powers are deranged, and the person acts as though drunk. This effect is produced much more quickly by the vapours of the above-mentioned substances than by drinking alcohol, it also passes off much more rapidly. It was to this action more especially that the effects of the nitrous oxide and ether were confined in view of their discovery from the use of these agents. If, however, the use of the hand is prevented, the effect extends from the brain to the cerebellum, and this organ loses the power of regulating the movements of the body. This effect on the body is also produced by the drinking of alcohol. As the vapour continues to act on the system, the next nerve centre affected is the spinal cord, and the functions of sensation and motion more immediately under the control of this part of the nervous system, are more or less affected. It is in this stage that the anesthetic agents come into play, for the function of the power left to maintain the functions of organic life. The heart, the lungs perform their functions, and other actions essential to life are carried on. These functions are, however, under the influence of these anesthetic agents, and should too large a dose of them be administered,
The general effects of chloroform resemble closely those of ether. It is, however, a more potent remedy, and produces anesthesia more rapidly and certainly than ether. Hence it has been employed more generally. This sub-stance was discovered by Liebig and Schonberg in 1831, and its chemical nature was investigated by Dumas. He first pointed out that the liquid which had been called chloric ether, and chloride of carbon, was composed as follows, C, H, Cl: and called it chloroform. Liebig has subsequently proved that it is the true chloride of carbon, or chloride of the base formyl. This substance is prepared according to the Pharmacopoeia of the London College of Physicians as follows:—Take of chlorinated lime iv. lb.; rectified spirit oss; water Ox; chloride of carbon broken into pieces. Boil together until the mixture is reduced to the water into a retort, and then add the spirit, so that the mixture may fill only a third part of the retort. It is then heated in a sand-bath, and as soon as ebullition begins the heat is withdrawn. The liquid is then distilled into a receiver. A quart of water is then added to the distilled liquid and well shaken. The heavier portion which subsides is then separated, and the chloride of calcium added to it, and frequently shaken for an hour. The liquid, which is then filtered, is the chloroform in its final distilled and glass receiver. It is a transparent colourless liquid having a specific gravity of 1·48. It boils at 140° Fah., and the density of its vapour is 4·2. It has a fragrant ethereal apple-like odour, and a slightly acid sweetish taste. The maximum dose is 60 minims. At natural saturation it is soluble in 2000 parts of water for its solution. It dissolves camphor, Indian-rubber, wax, and resins. It is not inflammable. This substance is sometimes given internally in doses of from five to ten minims, and acts as a stimulant sedative antispasmodic and anesthetic.

Administered in the form of vapour as an anesthetic, chloroform is much more powerful than ether. This effect seems to arise from its being much more sparingly soluble in the blood than ether. The quantity of chloroform says Dr. Snow, “required to induce insensibility is less than one tenth as much by measure as in the case of ether. Viewed in this manner, it is more than ten times as strong; but to obtain an equal comparison of physiological power, when inhaled in a similar manner, the volatility of ether to be taken into account. In order to perceive the relative strength of these two medicines, we may suppose that the air which a patient breathes is saturated at 60°;—the ordinary temperature of a dwelling-room,—with one or other of the vapours, and see how much air he would have to breathe in either case, in order to be narcotized to the third degree,—the extent of insensibility usually required in a surgical operation. Thirty-six minims is about the average quantity of chloroform given to a child weighing 12 pounds in the adult, and this would saturate 257 cubic inches of air at 60°, making it expand to nearly 300 cubic inches, which would be breathed in 12 ordinary respirations of 25 cubic inches each. The quantity of ether usually required to produce the same amount of insensibility in the adult, is about ¼ fluid drachms; this would saturate 440 cubic inches of air at 60°, and increase its volume to rather more than 800 cubic inches, which would require 32 ordinary respirations to breathe it. We see, therefore, that 13 inspirations of air charged with vapour of chloroform are equal to 32 similar inspirations of air charged with vapour of ether, at the same temperature; and that, consequently, chloroform is nearly three times as strong as ether. In actual practice, the quantity of chloroform used is greater than this; for ether abstracts much more colorless than chloroform during its evaporation, thereby reducing the temperature of the air passing over it, and the sponge or whatever contains it, and limiting its insensibility to a greater degree.”—Edinburgh Medical and Surgical Journal, No. 180.

It is on account of its greater strength that a larger number of accidents have occurred with chloroform than with ether, and with ether and chloroform in its administration, there seems to be no reason why chloroform should not be employed for the production of anesthesia. The usual method of administering this agent is to open it into a towel or any other receptacle, and apply it to the mouth and nostrils of the patient in such a way that the patient may take air into the lungs, which is saturated with the vapour of chloroform. During this operation care should be taken that a larger quantity of the vapour is not...
inhaled than will produce the fourth stage of anesthesia. By removing the handkerchief from time to time the patient may speak or shout loudly, according as one seems desirable. Although the administration of chloroform in the handkerchief is undoubtedly the most simple and convenient plan, it appears to be much safer to use an instrument called an inhaler by which the quantity administered can be measured and controlled with certainty. Such an instrument was early introduced and employed by Dr. Snow and the accidents which have occurred have certainly been fewer when this instrument has been employed than with the handkerchief. In the inhaler employed by Dr. Snow the containing vessel of the chloroform is surrounded with cold water, so that the quantity taken up by the air, and the expiration valve of the face-piece is so adapted as to admit additional air to any excess of chloroform vapour still further. From an investigation of the fatal cases and experiments upon animals, Dr. Snow has arrived at the following conclusions:

1. Chloroform vapour, if it be inhaled in large proportion with atmospheric air, destroys the paralyzing heart.

2. In smaller proportions, but long continued, it produces death apparently by the brain, and by interfering with the respiratory function. In such cases the heart is found to be still, after the respiration has ceased.

3. Chloroform vapour, if it be blown upon the heart, paralyses it immediately.

4. Atmospheric air loaded with from 4 to 5, or even 6 per cent. of chloroform vapour may be safely administered, inanition of this mixture will not act directly upon the heart, but will give rise to other effects by modifying the normal discharge of the functions of life. The average time occupied in producing insensibility is from three to four minutes.

5. Then, it should be as much as from 8 to 10 per cent. of vapour of chloroform to atmospheric air is a dangerous mixture, as it suddenly charges the blood going into the heart with a poison capable of acting directly on that organ.

The cases in which an over-dose of chloroform has been administered, the only remedy which appears to offer a chance of relief, is artificial respiration. Where the muscles of the tongue become relaxed, and this organ falls back over the glottis, it should be pulled forward till the patient revives. It might be desirable to open the larynx in order to relieve the distension of the right cavities of the heart.

The cases in which air was first employed, and in which chloroform is to be recommended by anesthetists, are those in which operations producing pain are performed. There are no operations, from the extraction of a tooth to the capital operations of surgery, in which it may not be employed. At the same time it may always become a question with the operator whether it be the best way to hazard of fatal effects for the sake of relieving a small amount of pain. Where chloroform is skillfully administered, there appears to be little or no hazard, but unfortunately it is not every one who is prepared to administer chloroform successfully. As a rule it may be stated, that it is not advisable for the surgeon who operates to administer the chloroform, and a competent assistant should always be employed to do this. Whatever may be the doubt in the minor operations of surgery, the beneficial effect of relieving pain upon the subsequent welfare of the patient in the capital operations of surgery, have led surgeons very generally to insist on its administration in these cases. It has now been shown, both by Dr. Simpson and Dr. Snow, that the fatal cases, after capital operations, more especially amputations, are fewer when chloroform has been administered, than when this or some other anaesthetic has not been employed. Looking to these results, it would appear that the administration of chloroform is of the greatest advantage; much greater than that sacrificed by its careless administration. When in addition to this it is recollected how great an amount of suffering is prevented, there can be little doubt as to the propriety of its administration.

It has been shown that certain portions of the system are less favourable to the administration of chloroform than others, but Dr. Snow has pointed out that in these states of the system, the pain of an operation would be as likely to act as injuriously as the chloroform. At the same time, it would appear that a certain number of the fatal cases have occurred in persons with diseased heart, and perhaps in these caution should be employed.
more in height, undivided by branches till near the top, and
covered by an ash-gray smooth bark; the leaves are 5 or 6
inches long and 3 or 4 inches broad, nearly opposite, oblong,
eliptical, shortly acuminate, coriaceous, smooth, shining,
and obscurely netted on the upper side. Families few-
flowered, small. Internally the bark is of a cinnamon-brown
colour. The fracture is rough and fibrous. The taste is
bitter, astringent, and aromatic. The seeds also contain
the beebearer, on which the medicinal properties of the
plant depend. The following is Dr. Malagagn’s analysis of the
two:

The alkaloid beebearer is obtained by decomposing com-
mercial sulphate of beebearer by ammonia; the precipitate
is then filtered and dried in a dish still moist with
moist hydrated oxide of lead, dried in a water-bath and ex-
hausted rectified spirit; an alcoholic solution of beebearer is
thus obtained. The alcohol may then be distilled from the
beebearer. If this is heated with ether a part will be left
undistilled. Mannich has called this another alkaloid
and called it siperine, but he now regards it as beebearer in
an oxidised condition.

When beebearer is obtained from its ethereal solution, it
is a yellow, amorphous, resinous-looking substance, but in
the form of powder it is white.

The effect of the Dibiru bark is the same as that of cin-
chona. It is bitter and tonic, and possesses antiperiodic or
febrifugal virtues. The alkaloid possesses the same pro-
perities, and from experiments which have hitherto been
made, although it is not so powerfully febrifugal as quinine,
it does not produce the headache, feverishness, singing in
the ears, and other symptoms which are sometimes found to
follow the administration of quinine. In intermittent and
remittent fevers, in neuralgia, and in some cases of constipa-
tion, it has been recommended, and especially in those cases
where quinine disgrades.

BENTHOOLETA. [BENTHOOLETA.] 

Cadmium, iodide of. The preparations of iodine with
the metals have many of them been found to be accidio-
cious in the treatment of disease both internally and exter-
nally. Dr. Garrod has recently recommended the iodide of
Cadmium for external application. "I had," he says,
"previously felt the want of an agent containing iodide,
and fitted for external application—those usually employed
having many objections. The free iodine, or iodine com-
bined with iodides of potassium, as occurs in unguentum
iodinii composition, P. L., is frequently too irritant in
its nature, besides which its disagreeable and, at the same
time, the action of the coltule which it produces is often very
objectionable."

"The simple iodide of potassium ointment, as ordinarily
dispensed, is gritty in character, often to such an extent as
to render it impossible to apply. The nitrate of silver,
when mixed with fatty substances, as not very readily ab-
sorbed by the skin, and consequently not well adapted to
produce the peculiar local effects of iodine which is often so
advantageous to obtain; for it must be remembered that
iodine is not always used simply for its rubefacient or
counter-irritant action."

He adds, that the iodide of cadmium is not open to these
objections. Mixed with eight parts of lard it forms a per-
fectly white and soft ointment, which produces but little
local action upon the skin, and appears to be readily
absorbed when properly applied with friction.

Dr. Garrod recommends this ointment in enlarged scro-
fulous glands, in joints affected by chronic inflammatory
disease, in various cutaneous diseases, and chilblains.

The iodide of cadmium crystallises in white 6-sided
mucous tables, and is soluble in water and alcohol.

Chromic Acid has been recommended by Mr. Marshall
as an escharotic. It acts as a caustic and is of greater
caustic and is of greater

The solution is best applied by aid of a pointed glass rod,
or, where a large quantity is needed, by means of a small
glass tube drawn to a point. Only so much should be
applied as will prevent the disease growing, avoiding the
surrounding healthy mucous membrane; for although the
solution is not sufficiently powerful as an escharotic to
destroy or even vesiculate the mucous membrane, it may
give rise to an unnecessary amount of subsequent inflam-
matary action. It is, moreover, a very strong caustic, but
which no serious consequences have been found to ensue.
Any superficial acid may be removed by a piece of wet
lint. The first effect of its application to the warts is to
produce a general acrid pain. In some cases, where an ulcer-
ated surface be touched, the pain is of a burning nature,
more lasting, but not so acute and intolerable as that caused
by the nitrate of silver, or by nitric acid, with or without
arsenic acid. After a short time the pain passes off, but
the inflammation remains, and the wart, with extraordinary
dependent on the expenditure of more or less inflammation in
the parts. This inflammatory action is accompanied by a
purulent discharge, and under its influence the morbid
growth is rapidly wasted, in some cases being thrown off
entirely altogether. In but one instance has there been any
evident diminution in size. The best immediate dressing
to the parts is dry lint, as that does not dilute the strength
of the chronic acid solution, and is at the same time clean.
Afterwards the lint should be changed twice daily, or, what
is better, a piece of lint moistened with the solution of
the parts may be washed with a solution of lead, and dressed
with lint moistened in the same.

"In most cases of warts, one application suffices, the cure
being completed in four or eight days. The extreme period to
which the inflammation set up by the chronic acid has been
found to continue active is about four days. In severe
cases, where the warts are large, repeated applica-
tions are necessary, each being followed by less incon-
veniencing and more characteristic effects of the inflam-
mation. But in one instance, so far as hitherto observed, have
more than three applications been required, and in that there
was great neglect as to proper cleanliness and dressing."

Coc Liver Oil is an oil obtained from the liver of the
common cod, Gadus Morrhua, Linnaeus. This, and other
oils from fish, have been for a long time popular remedies
amongst people living on the sea-shore, especially those
engaged in fishing. In 1783 it was recommended by Dr.
Perceval as a remedy in chronic pneumatosis, and in
1800 Dr. Baldes stated it was a popular remedy in many
parts of Lancashire. In 1841, Dr. Bennett, of Edinburgh,
wrote a treatise on the ‘Oleum Jecoris Aselli,’ recommending it
especially in scrofulous diseases.

Although the oil is named after the Cod, from the liver
of which animal it is most frequently and abundantly ob-
tained, other fish yield oil in their livers and adipose tissue
with which this oil is frequently mixed. The oil sold in
England usually comes from Newfoundland, where it is
obtained by a method different from that on the Baltic codfish
which are caught in the seas around that country.

As it comes into the market it is usually of a chestnut-
brown colour, and has a fishy smell. It is now, however,
subjected to a preparation, by which its colour is almost
entirely removed, and to which it is no longer smelly.
Although more agreeable to the taste, it does not ap-
ppear that its therapeutical properties are improved by this
process. The following is Dr. De Jongh’s analysis of the
three kinds of oil which are to be found in the shops of
London:
young children who will not take the oil, cream has been substituted with advantage.

In the case of rheumatism and scorchorous swellings the external application of the oil has been attended with advantage.

The friction of the whole body in cases of phthisis and scorchorous diathesis has also been strongly recommended by Dr. McColloch.

When other remedies are employed in conjunction with cod liver oil, they may be added to this substance, and many preparations of this kind are kept ready for use by druggists. The action of the oil has been used against compounds that if kept long the oil becomes rancid, and decomposition of the medicines take place. They are therefore best prepared extemporaneously.

**DEODORIZERS AND DISINFECTANTS.** Although these terms are frequently used synonymously, they do not have different meanings. Deodorizers are substances which deprive decomposing animal and vegetable substances of their disagreeable smell; whilst disinfectants are agents which have the power of destroying the infectious or contagious properties, more especially of animal poisons. Many substances which have the power of effecting the first object, do not attain the last; and it is important to know that frequently when a foul smell is removed, an animal poison may yet remain invisible. Indeed, many of the substances which are not attended with any smell at all, as those of the small pox, typhus and scarlet fever.

One of the most powerful deodorizers known is chlorine. This arises from its affinity for hydrogen gas which enters into the composition of those gases which affect the senses in a disagreeable manner, as sulphured, phosphureted, and carbureted hydrogen. As these gases have an injurious effect of their own upon the system, and affect the senses disagreeably, they are always to be got rid of as quickly as possible, and the various preparations of chlorine, more especially chlorine itself, and chlorinated lime and soda have been employed for this purpose.

The chlorides of zinc, iron, and the metals may also be employed as disinfectants for decaying and putrid bodies. One of the most effectual methods of evolving chlorine in the air has recently been proposed by Mr. Lamboss. It consists in obtaining chlorine from common salt by the following process. Take of common salt two table spoonsful, red lead two spoonsful, oil of vitriol half a wine glass full, water a quart. Mix the red lead with the salt, and add to it the water, stir the mixture well with a glass rod, and add very gradually the oil of vitriol in small quantities. The mixture will form a thick liquid, or solution of chlorinated soda and chlorine remain in solution. By exposure to the air the chlorine escapes very gradually and uniformly. When not wanted the bottle may be closed.

**Oxygen** is another powerful deodorizer. By the action of this gas the decomposing animal and vegetable substances decomposing at length become purified. It is however, desirable to supply oxygen faster than can be done from the atmosphere, and this can be effected by the manganeic acid and permanganate of potash. The acid consists of one part of manganese and three of oxygen, whilst permanganate of potash consists of one part of potash and two of manganeic acid.

These substances, more especially the permanganate of potash, give off readily their oxygen gas and on being mixed with decaying animal and vegetable substances render them perfectly pure to the smell. Dr. Hoffman is a report made to the Board of Health on these substances, in 1818.

"The manganeates and permanganes surpass in their deodorising and disinfecting powers most compounds which are usually employed for this purpose. Metallic salts, such as the compounds of lead, iron, and zinc, &c., act extremely well, if the odour to be removed arises from sulphured or combined hydrogen and ammonia, or substances analogous to the latter; when a metallic sulphide and a salt of a metallic amonium is formed. But, frequently, the odour belongs to substances of a different class, which are fixed by neither of the above means. In the case of this, the water, which in my experiments yielded perfectly to the action of the manganeates, was scarcely altered by the use of very considerable quantities of the usual metallic salts. Moreover, the oil of vitriol, commonly used by druggists in this, only taints the water, but does not entirely remove the taint.
ammonia-like compounds by that of a powerfully fixed alkali. The manganesates and permanganesates, on the other hand, destroy the smelling substances completely; containing, as they do, large rays of oxygen; the very agents which accomplish all natural destruction, they give rise to an actual process of combustion, in consequence of which the cause of the odor or putrefaction is permanently removed. They resemble, in this respect, the alkaline solutions of nitrous oxide or lime (chloride of lime), the action of which is likewise permanent. The hypochlorites act with less energy and rapidity than the manganesates, and are in this respect inferior; but they have an advantage over the latter by their evolving chlorine in the gaseous state, and destroying in this manner odorous and putrefactive substances which are diffused in the atmosphere. But as the chlorine evolved is frequently found objectionable by, and injurious to, particularly in the case of plants, it would be important to ascertain whether the same effect could not be accomplished by exposing the contaminated air to the action of extended surfaces of solutions of the manganesates and permanganesates, either contained in shallow vessels, or diffused over sheets of wire gauze.

"The manganesates and permanganesates have, moreover, the advantage of possessing peculiar and strongly marked colours, whereby they are readily and safely distinguished from other compounds. In consequence of this marked character, they have become useful, not only by the incalculable and erroneous use of hypochlorites, or of metallic salts, are scarcely possible with the manganesates and permanganesates, which are, moreover, in themselves completely harmless."

A solution of twenty grains of permangenate of potash in a pint of water has been of much service as an application to phagedenic ulcerations, and to sloughing sores in various parts of the body. It has also been found particularly beneficial as a suppuration to cancerous sores, where the smell is sometimes very offensive.

Where clothes, bedding, and other materials have been in contact with poisonous effluvia, one of the most powerful disinfectants is heat. The application of heat to substances articles thus affected by subjection to the action of boiling water, or exposing them to heat in ovens or closed vessels constructed for the purpose. (See Minute of Information on Disinfection and Deodorisation, published by General Board of Health, 1857.)

DIPHETHERITIS. [Phthis, Practice of, & 2.]

HYPOCHLOROUS ACID is a compound of phosphorus and oxygen, in the proportion of one equivalent of each. It may be prepared by the decomposition of phosphide of benzene in the presence of air. Such acids are readily formed by the action of the alkalis and oxides of the metals, forming hyposulphites. These substances have lately been introduced into medicine as a remedy for pulmonary consumption. In a paper presented to the medical profession of the United States by Dr. M. Moreton and Humboldt, it is said to be solid body occurring in nearly a sulphur of a yellow colour, friable, soft to the touch, of a persistent aromatic odour, with a mild and unoffensive taste. When this substance is administered to animals, they give off ammonia, and leaves hydrated hypochlorous acid.

IODOFORM, a compound of iodine, and the compound radical formyl. It was discovered by Serullis, and has been recently investigated in the United States by M. Wallis. It is generally obtained by MM. Moreton and Humboldt. It is a solid body occurring in nearly a sulphur of a yellow colour, friable, soft to the touch, of a persistent aromatic odour, with a mild and unoffensive taste. When this substance is administered to animals, they give off ammonia, and exhibit symptoms of great depression and exhaustion. The symptoms of depression are followed by convulsions, contractioes, and other effects upon the nervous system. After death they exhibit no signs of any marked looseness or unsteadiness.

The authors above mentioned suggest that this remedy may be employed in all cases where iodine is indicated. It is more rapidly absorbed into the system than iodine, and produces fewer and less severe local effects. It has been observed to attend the action of iodine. They recommend it from its soothing properties in neuralgia disorders. They have also employed it with success in goitre, scrofula, rickets, and syphilis. The dose is from half a grain to eight grains in the course of the twenty-four hours.

KOSO or KOUSSO, the Abyssinian name for the flowers of the Brayera anthelmintica, a plant belonging to the natural order Rosaceae, has been introduced into European practice as a powerful remedy for worms. It has been known in Abyssinia upwards of two centuries, as an anthelmintic, and has been mentioned by several writers. The plant which yields it has been named after Dr. Brayer, a French physician who resided a considerable time at Constantinople, and having had opportunities of witnessing the anthelmintic properties of this plant, brought some of it to Paris in 1823. On being sent to Kuntch, he found it to be a new genus of plants belonging to the order Rosaceae.

The Brayera is an Abyssinian tree twenty feet in height, with round rusty tomentose-villoses branches, marked by the annular electrices of the fallen leaves. The leaves are opposite, thin, oblong, or oblong-lanceolate, acute, serrate, villose at the margin and on the nerves of the under surface. Stigmas adnate to the pedicel. Flowers dioscuia, small, and greenish, the calyx with the tube bibracteolate at the base and turbinate; throat constricted internally by a mem-
branious ring; limb 10-petale; the segments in two series, the five outer ones much larger, oblong-lanceolate, obtuse, reticulately veined, stellately patent, the five inner ones alternate, smaller spatulate. Petals five, inserted in the throat of the calyx, small linear. Stamens from fifteen to twenty, inserted along the petals. Filaments free, unequal in length. Anthers bicolored, dehiscing longitudinally. Carpels, two placed at the bottom of the calyx, free, unilocular, each with two small styles, exserted within. Styles terminal, exserted from the throat of the calyx, thickened upwards. Stigmas subulate-dilated, crenate-oblong.

This plant grows in Tyre, Agame, and Shoa, and is cultivated everywhere. But it is not grown throughout the entire table-land of north-eastern Abyssinia, at an elevation of 6000 feet. He found it at the mouth of the Abai (Bruce’s Nile) at an elevation of close upon 9000 feet. Bruce describes the flowers be as being of a greenish colour, tinged with white, and when fully blown of a deep red or purple. The petals, he says, are white. When prepared for medicinal use, the flowers are gathered before the seeds are ripe, and whilst some of the flowers are unopened. The bunches are suspended in the sun to dry, and afterwards packed as a remedy. When sent to this country it is packed, as is the Koso, in boxes, and the Koso is contained in leather. It has a very powerful balsamic odour. The following is an analysis of Koso by Wettstein:

There is nothing in the botanical structure, or in the chemical composition, or physical character of this plant, that is peculiar to it, save the peculiar smell. It is in fact a species of Anthelmintic. Yet there is no question on this point. The inhabitants of Abyssinia, from their habit of eating uncooked food, are very liable to the attacks of various forms of tapeworm, and the Koso is universally employed among them as a remedy. Every traveller attests its efficacy. It has also now been employed in France, England, Germany, and Switzerland with the same success.

The mode of administering it in Abyssinia consists in taking one or two of these flowers and infusing them in hot water. In England, 240 grains or half an ounce is regarded as a full dose, children from 7 to 12 years of age may take 160 grains; from 3 to 7, 120 grains; and not exceeding 3 years of age, 90 grains. This dose should be taken in the form of a decoction, the previous meal should be left at having been slitted. The flowers are infused in from 6 to 10 ounces of luke-warm water for about a quarter of an hour. A little lemon-juice is then to be swallowed, and the infusion being stirred up, the whole is taken, liquid and powder at two or three draughts at short intervals, being washed down by cold water and lemon-juice. In three or four hours, if the remedy has not operated, a dose of castor oil should be taken.

It is not known that the practice of using this remedy at first was its high price. When first brought to Paris it was sold as high as 14 l. 5s. per ounce. It is now (1858), however, sold at a moderate price. The most recent notice of this remedy is in the first volume of Dr. Kohlmeiser’s work on Animal Parasites, where the Royal Society of London has employed the following method:—Koso is macerated for 24 hours in cold water, and the boiled for half-an-hour. This infuses-decoction is then taken whilst fasting in two portions, without straining, and not later than 2 hours after. As is never seen any of the secondary effects, at the same time, the extremely fragmentary state in which the worm passes prevents me from giving the remedy a preference over turpentine and pomace. Yet, according to recent reports, the plant of Kousso, has employed the following method:—5gr of Kousso are macerated for 24 hours in cold water, and then boiled for half-an-hour. This infuses-decoction is then taken whilst fasting in two portions, without straining. And here I must add that the flowers of Asfassetida, as is also the leaves of Jasminum floribundum (Herba Zelini), is, as is well known, often added to Kouasso, and is even administered alone, in doses of 70 grains, as a remedy against Typhus.

In other respects, it acts as a pretty strong narcotic in lower animals, as, for example, when thrown into water it stupefies fishes. For these reasons I should in this case say, not so much that the agent is adulterated, as that it is often administered in combination with other Abyssinian remedies for tape-worm. According to my experiments, even the thick Tr. crassicolor of the cat died very soon if a white of egg mixed with a decoction of Kousso was given. The dose of the powder of Kousso is 5gr to 3j. For my part, I have always been more or less unlucky with this remedy, which, in the ordinary mode of administration, shares all the properties of Kousso. It produces sickness and violent pains in the intestines. In my own experience, I have generally seen the worm expelled in innumerous fragments after the use of this remedy or its preparations. I have only seen larger or smaller portions of the worm, or, at the utmost, the whole worm expelled by it; but have never found the head. In one case I certainly detected fragments of tapeworm in the evacuations for three months. Once I saw the worm passed up to the neck in the morning, but the head was expelled only after the patient had of his own accord at once more a second dose of Kouasso, and thus brought upon himself no slight pains in the bowels.

"Very recently Professor Martius, of Bruxelles, and Professor von Raimann, of Vienna, have described the mode of employing Kousso. According to Martius, the powder of Kousso always killed the worm, but in no case did the head pass away. He therefore endeavoured to isolate the active constituent of the powder: He obtained it in fine powder by the action of alcohol. It was otherwise with a soft resin of the Kousso, of which 3j were obtained from 5j of Kousso, but in which there was certainly still some red resin and viscid substance. This soft resin, or, more correctly, resin obtained by the alcohol filtered and filtered; the alcoholic solution was dropped upon sugar. As soon as the alcohol was evaporated, the solution was again poured upon the sugar, the whole was well dried, and reduced with sugar to the finest powder, sugar being added to the powder until it became of the same weight as 3j. This very finely divided resin was mixed with 3j of honey, and the whole administered in a period of 12 to 16 hours, commencing at four o’clock in the afternoon. The method was given (castor oil or a salt). In this way, with this resin kindly sent to me by Martius, I treated three patients in September, 1854; one of them being a very weakly boy of 14 years old. In all three cases the worm was expelled. The patient’s bowels were frequently opened (bisecately) and filtered. As I have never seen any of the secondary effects, at the same time, the extremely fragmentary state in which the worm passes prevents me from giving the remedy a preference over turpentine and pomace. Yet, according to recent reports, the plant of Kousso, recently in flourishing about which to which is described by Kumpfer. The botanical characters of the genus Nathe are as follows:

- Umbels, compound; involucres, absent; calyx, obsolete; fruit, thin, compressed at the back with a dilated border.
ridges 3, only dorsal; ytte, one to each dorsal faww, and two to the laterals; albumen, thin flat.

V. Assafetida, Falconer: Radical leaves 3-parted; segments, bipinnatifid with oblong- lanceolate, obtuse, decurrent lobes. The rootstock is a thin, the matters remaining at the crystallization of the sulpha of quinidine are of a complicated character, and probably consist of uninvestigated forms of alkaloids, similar to and more powerful in their action than sulphate of quinidine. Whatever may be the nature of these substances, they are now sold under the name of sulphate of quinidine.

The most recent publications on the medicinal efficacy of quinidine are a paper by Dr. Harting, in Smith's *Jahrb.,* 1855, and another, in the *Philadelphia Medical Examiner* for May, 1855.

Dr. Harting states that, from 12 years' experience in the treatment of agues, he finds it to be superior to the common sulphate of quinine. Dr. da Costa gives a summary of 63 cases of intermittent fever treated by quinidine. In many of these the disease was of long standing. The rigor were arrested in 49 cases by the first administration of the medicine, only 4 requiring a repetition. The quantity given varied from 1 to 40 grains; the average was 20 grains.

**Sanguinaria**, the Pensean or Canadian Blood-root, so called from the red colour of its juice. This plant is a native of America, and has long been used by the Indians on account of its acid narcotic properties. It has lately been introduced into European practice as a remedy for cancer.

The genus Sanguinaria has the following characters. Petals 8—12; stamens, 24; stigmas, 2; capsule oblong 2-valved, ventricose, acute at each end with deciduous valves, and 3 permanent placenta.

*Camptanthus* is a slender, early spring flower, and grows in most parts of the United States and Canada in woods. It is a smooth plant with a creeping root-stock, which emits a bright orange juice when cut. The leaves are radical, oblanceolate, linear, and the flowers reniform or heart-shaped, with large roundish leaves separated by obtuse sinuses. The underside strongly reticulated with veins paler than the upper, and at length glaucous. Peduncles solitary, axillary round, one-flowered, in which young leaf. Sepals, 2; petals, 8; stamens numerous, with yellow anthers. Ovary, oblong; style, none; seeds numerous, of a dark shining red colour. In their report on Dr. Fell's method of curing cancer, the surgeons of the Middlesex Hospital thus speak of this remedy.

"Whilst the medical profession are of the judgment of the inefficacy of blood-root in the management of cancerous discharges, we see no objection to further and much more extended observations of its effects in that disease. It is evidently a powerful remedy, and as an external application is, perhaps, equal to any drug now employed in England. But our hope of its usefulness in cancer is very small; and that becomes less still, when we remember that Dr. Fell himself never suggested that patients should continue the constitution for several months at the least, and that the healing of the wound, and the use of the sanguinaria pill in cases of internal cancer, or of those external malignant tumours which were rejected as unfit for local treatment.

It is probable that the use of this remedy in the cases alluded to, will lead to further trials of its properties, and it may yet be a valuable remedy in the list of Materia Medica.
THIERRY, JACQUES-NICHOLAS-AUGUSTIN, the distinguished historian, was born at Blois on May 19, 1765. In 1806 he commenced his studies in the college of his native town. He was first a pupil of the Jesuits, but in 1813 he became a teacher in a provincial school. In 1814 he went to Paris, enlisting himself as an adherent of the socialist principles of the Count St. Simon, of whom he became a devoted disciple. In 1816 publicized histract "Des Nations et de leurs Rapports mutuels." He however shortly penetrated the fallacy and shallowness of his master's doctrines, abjured them, and became with Comte and Duroy the editor, in 1817, of the "Censeur Européen," a newspaper which he conducted with great success. He transformed the theory of the continued existence of two classes in England—the Norman masters and the Saxon servants, whose successive struggles he traced down to the time of Charles I. in an essay in this paper, and which, with much perverted ingenuity, but with perfect consistence and conscientious industry and perseverance in historical investigations which he then commenced, he has supported in all his subsequent works. On the suppression of the "Censeur Européen" in 1820 he proposed to the editors of the "Courrier Français" a series of letters on the history of France, for he says of himself that he had then found that history was true vocation, and he was accepted as a contributor. With the second letter commenced the controversy which he pursued his course; but on receiving several other letters of disapprobation, the editors wished him to vary his subjects. This he declined doing, and he ceased his operations in 1821. But his historical studies, which however he had to pursue under increased difficulties as approaching blindness rendered him unable to read, but he bore the deprivation with philosophical calmness. In 1826 he published his "Histoire de la Compréhension de l'Angleterre par les Normands," a work, which, despite his false theory of the ever-enduring difference of classification of the two races, is of a high merit, as displaying great power of acute discrimination, the result of a mind interested by, and pursued with pleasure and animated descriptions grouping the peculiarities of the time, and an animated style. It has gone through many editions and has been translated into English and German. In 1827 he issued his letters from the "Courrier Français" in an extended, and collected form under the title of "Lettres sur l'Histoire de France," which have also been translated into English. In 1828 a nervous disorder, added to his now rapidly failing sight, occasioned his withdrawal from medical articles. In 1831, near Toulon, for the benefit of the sea-air of the Mediterranean, he was elected a member of the Académie des Inscriptions et Belles-Lettres, and was created a member of the Legion of Honour, of which he was made grand-croix in 1833. The member of the Academy on the day he died, 31st January 1835, 1831 to 1835 he passed partly at the warm baths of Luxeuil and partly at Vesoul in Haute-Saône, during which time, with the assistance of his brother, he composed his "Dix Ans de Recherches historiques," a series of excellent essays, the product of his previous investigations, which was published in 1835. At this time, he was called to Paris by Guizot, who was then minister of public instruction, who confided to him the editing of a "Récueil des Documents inédits de l'Histoire du Tierre-États," which forms a part of the 'Collection des Documents inédits de l'Histoire de France.' In 1840 he published his "Récits des Temps Mérovingiens, précédés des Considérations sur l'Histoire de France," to which the Academy awarded his prize, and of which also there is an English translation. A collected edition of his works was published in 1853. He died May 21, 1856.

As an historian Thierry takes rank with Michelet and Guizot. Less profound in philosophical disquisition than Guizot, less elegant and imaginative than Michelet, he excels both in the power of grouping large masses of detail, and of seeing and presenting every point of interest or importance; he combines picturesque effects with minute knowledge; and the style is earnest and incisive though not always austerely so. He is more than the mere history writer; is consistently devoted to his vocation. While nearly every French writer of eminence looked forward to political influence or employment as his reward—and many carry on their studies often having abandoned the previous principles or opinions—Thierry held on his work undeviatingly. His consolation under various afflictions he has himself stated: "Blind and suffering, without hope and without intermission, I will give this testimony which from me no one will dispute, of the value of those physical enjoyments, better than property, better even than health; it is a devoted attachment to a science."

JULES THIERRY, whose chosen name was O'Jarephanick, was born at Thiers in 1831, and was of essential service to him in his then state of total blindness. In 1838 he published 'Sobres de Mours aux 18me et 19me Siècles, for which her husband wrote an introduction. She was also the author of a number of clever essays in the 'Revue du Deuxième Empire.'

THIOSSAINAMINE. [CHEMISTRY, § 2.]

THOM, JAMES, who acquired considerable temporary celebrity as a sculptor, was born in Ayrshire in 1799. He was brought up at the stone-mason's art in some stately mansion. He went to Rome, and obtained a commission to execute a statue of the poet, which was afterwards sold to Samuel O'Farrell, of New York. On his return to Scotland, in 1818, he was engaged to execute a statue of the Duke of Manchester, and was then about to begin a monument of the Duke of York, when on the 2nd of August, 1819, he died. A bust of his work in marble, executed by himself, is preserved in the National Gallery in London, where it was exhibited in 1824. He was also an accomplished writer on the art of sculpture. Some small figures which he carved illustrative of the poetry of Burns secured him a local fame, and he was tempted to try his chisel on other life-like figures. He accordingly produced in sandstone statues of Tam O'Shanter and Souter Johnson, which had a surprising run of popularity. After being successfully exhibited in Scotland they were brought to London, where they proved equally attractive, and the self-taught sculptor found himself for a time 'a lion.' He was commissioned to execute a statue of the Duke of York, and was then engaged in small plaster models of them were produced in great numbers. There is undoubtedly a good deal of humour and spirit in the figures, but they are rude and inartistic in conception and execution, and are notaltogether calculated to do honor upon the sculptor himself. He afterwards executed a statue of 'Old Mortality,' and several other works; but he appeared to be falling into comparative obscurity when, about 1836, the misconduct of an agent whom he had engaged to manage his affairs, caused him to lose most of his funds; and the O'Shanter and Old Mortality in the United States, led Thom to proceed to America. Eventually he determined to remain in New York, where he found considerable professional success, and was able to pursue this line of life without further interruption. He died at New York on the 24th of April, 1850. The original figures of Tam O'Shanter and Souter Johnson, are placed in a building attached to the Burns monument on the banks of the Doun; there are copies of them in England, and at Mr. Colt's, Paterson, New Jersey. His group of Old Mortality stands at the chief entrance of the Larch Hills, in New York.

THOM, WILLIAM, the weaver-poet of Inverury, was born at Aberdeen in 1799. At ten years of age, with barely the elements of education, he was bound for four years to a weaver as apprentice. In his early days he had a passion for reading and writing. He was always a poor boy, and it was when he was required to help weavers that he first, "picked up a little reading and writing," trying at the same time to acquire Latin, but being "defeated in want of time." At the end of his apprenticeship he was engaged at another factory, where he worked for seventeen years, learned to play the "German flute," and "every Scotch song that is worth singing." He married about 1829, had a family, and after some other removals settled for a time at Newly, near Cupar-Angus in Forfarshire. He was then where the great commercial failures in America occurred, one consequence of which was the composition of employment for the poor hand-loom weavers. With a wife and four children, without work, in a neighbouring village where nearly all were as poor as himself, and in a country where the poor laws were not yet introduced, the sufferings of the family were extreme, and in a cold spring day of 1837 they resolved to set off to walk to Aberdeen, in hopes that there they might procure employment. Of this journey he gives a vivid and pathetic narrative. One child died on the way, and of the wife, in order to obtain the means of procuring bread, he had recourse to his flute, which sometimes brought him trifling gift, and he made his first attempt at song-making in an address to his flute. This he had printed, and by presentation to the earl of Aberdeen in 1838, he received sufficient to enable the family to reach Aberdeen. He obtained work, first in that town, and then at Inveraray. In November 1840 his wife, whose health had been weakened by her late sufferings, died in childbed. His new affections again drove him to poetry, realizing Shelley's words that poets "learn in suffering what they teach in song."
THO 689

He sent one of his compositions, 'The Blind Boy's Pranks', to the 'Aberdeen Herald', where it was inserted with much commotion. On his way home he met a man named Knockpeoch, a gentleman in the neighbourhood, who relieved and patronised him. He had other poems by him, which were produced and admired, and he was brought to London, feasted at a public dinner, and received that sort of celebration which is optional for a poet. In his case of Burns, a patronage that only enhances the bitterness of the fate to which its objects are almost inevitably consigned. Then returned to Inverary, resolving, he said, not to be too much elated by the applause he had received, but it was not enough to last him. He published in 1841 at Aberdeen, a small volume of poems, 'Rymes and Recollections of a Hand-Loom Weaver', which had but a moderate success. His poetical powers were not great: his verses consist in the exact reproductions of feelings he had himself experienced, with a melody of versification and a correctness of taste remarkable in one of so extremely limited an education. He married a second wife, was often subjected to the extremest need, and at last died in great poverty in March 1850. His widow died in the July following, and a subscription was raised of about 200l. for his destitute children.

THOMSON, WILLIAM, a celebrated Irish naturalist. He was received into the medical faculty at Dublin, and William, his eldest son, was born on the 2nd of November 1805. As his father destined him for a commercial life, he received such an education as was supposed to fit him for that pursuit. In 1821 he was apprenticed to a firm in the linen trade, but finding himself unsuited to that life, he acquired no taste for natural history, he soon took an interest in this subject from making excursions with a fellow apprentice who possessed a copy of Bewick's 'British Birds,' and a passion for collecting and stuffing birds. For several years he was hardly more than an amateur; but in 1832 circumstances occurred which induced him to give up business, and from that time he devoted himself in earnest to natural history. Although birds were his favourite study, he directed his general practice to all groups of animals and plants, and eventually there were few Irish minerals, plants, and animals, with which he was not cognisant. He first became known as a naturalist by his contributions to the 'Proceedings' of the Zoological Society of London, on the natural history of Ireland. The names of some of these early contributions indicate the direction of his mind: Catalogue of Birds new to the Irish Fauna; On some Vertebrata new to the Irish Fauna; On some rare Irish Birds. He went through the whole range of the vertebrates, and Elasmobranchs, and worked out with great care the classification of a new Genus of Fishes; On the Irish Hare. He also prepared to lay before the meeting of the British Association for the Advancement of Science, held at Glasgow in 1840, a Report on the Fauna of Ireland, Division Vertebrata, which was read before the meeting. He described the vertebrate animals of Ireland, or an account of their comparative scarcity and abundance, but an exposition of the number of species in Ireland, the most western land of Europe, it is not only enriched with other British and European species. In 1844 Mr. Thompson accompanied the late Professor Edward Forbes on a voyage in the 'Zoean' in H.M.S. Becon, commanded by the late Captain Graves, R.N., during which he made a large number of observations on the natural history of the countries which he visited. Some of these he subsequently made use of in his works on the natural history of Ireland. From 1841 to 1848 he was a frequent contributor to the 'Annals of Natural History,' and also engaged in collecting materials for his further report to the British Association on the Invertebrate Fauna of Ireland. This report was read at the meeting of the association at Cork in 1843, and is remarkable for the large amount of minute information it contains on the natural history of Ireland. From this time his papers on Irish natural history became more numerous; a list of above seventy is given in the Ray Society's 'Bibliography,' and these were preparations for a great work which he had projected on the natural history of his native country. The first volume of this work was issued in 1851, and the second in 1853. These three were devoted to the birds. He did not live to complete his work. He had been mainly instrumental in inducing the British Association to meet in 1852 in Belfast. In promulgating this project, he died on the 1st January of that year, when he was seized with paralysis, and died in the course of a few hours. The manuscript of another volume on the 'Natural History of Ireland' was found after his death in a sufficiently advanced state to be given to the public, and it was published with a short memoir of the author in 1856. Unpublished also were papers in all the local institutions of his native town. He was president of the Natural History and Philosophical Society of Belfast, member of the Royal Irish Academy, and a member of several other scientific societies. William Thompson is a remarkable instance of a man who, by the devotion of average talents to one great object, succeeded in his work on the natural history of Ireland in achieving for himself a lasting reputation, and who, having to seek the most miserable monographs on the distribution of animals in Europe.

THOMSON, ANTHONY T. B., was born in Edinburgh on the 7th of January, 1778. He married Ann, daughter of Robert Bottchman, a celebrated professor of natural history in the University of Amsterdam, and obtained lucrative appointments under the British government, being Postmaster-General for the province of Georgia, and Collector of Customs for the town of Savannah. Having refused to take the oath of allegiance to the American government, on the breaking out of the Revolution he was compelled to relinquish his appointments, and returned to Edinburgh. Anthony Todd was born prior to this, whilst his mother was on a visit to Edinburgh. He married, in 1764, Ann, daughter of Sir John Hay, Lord Cockburn, which lasted till his death. His father destined him for business, but having obtained a clerkship in the Post-office, he was enabled by the leisure it afforded to follow a study in which he had already acquainted himself with medicine. He attended the lectures of Munro, Gregory, Black, and Dugald Stewart. In 1798 he became a member of the Spectaculo Society, and the companion of Jeffrey, Horner, Brougham, and Lord Lamingden. In 1799 he became a member of the Royal College of Physicians, and in 1799, he left Edinburgh, and established himself in London about the year 1800. He commenced the practice of his profession in Sloane-street, Chelsea, as a general practitioner, and a general practitioner he continued when once commenced it was never interrupted. In the midst of a large general practice, he found time to cultivate science and literature. He was mainly instrumental in procuring the enactment of the Apothecaries' Act in 1814. His first literary work was published in 1810, and entitled 'Conspectus Pharmacopoeiae.' He sold the copyright of this book for twenty pounds. In 1833 it was bought by the Messrs. Longman for two hundred pounds. It has been translated into French, and is called 'London Dispensatory,' which was a work of great labour. It contained a critical account of all the medicines and their compounds which were in use in Great Britain. It has been translated into several European languages, and ten editions have appeared. In 1833, he published a large collection that he made in the course of his practice, which he called 'The Chemical Pharmacopoeia of Great Britain.' He died at his residence in Sloane-street, Chelsea, on the 13th of July, 1839. He was one of the most learned and most able of his time in the practice of medicine, and that he was one of those who appreciated the value of this instrument when its use was generally neglected. From 1826 he was a member of the Royal College of Physicians of London, and commenced practice as a consulting physician. In 1826 he was elected professor of Materia Medica to the London University, now University College, and in this position he worked with great ardour at the subject of Therapeutics, and was one of the first to introduce the new substances discovered by the chemist into the practice of medicine. He formed here a very fine collection of specimens of materia medica, but the college had not the means of purchasing it after his death, and it has been lost to the country. In 1832 he was appointed professor of Medical Jurisprudence. The lectures delivered from this chair were published, and they were well received. In 1839 Thomson published his 'Elements of Materia Medica,' a work of a more scientific character than his 'London Dispensatory,' and entering more fully into the subject of Therapeutics, and was one of the last to be heard of the death of Dr. Todd. He died at his residence at Sloane-street, Chelsea, on the 13th of July, 1839.
he was engaged in preparing 'A practical Treatise on Diseases affecting the Skin,' which has since been completed and edited by Dr. Parkes. In 1848 his health first began to fail. He continued to give his lectures, with considerable interruptions, till the following summer, when he was obliged to retire into the country, and died of bronchitis at Edgeworth, near Huddersfield, 1849.

Dr. Thomson was a man of unwaried industry, and throughout his long career, pursued his labours with few or no interruptions. He was a man of varied attainments, cultivating literature and art, and was not an unfrequent contributor of literary articles to the Magazines and Reviews. He translated from the French, and edited, a work by Mons. Salverte, entitled 'The Philosophy of Magic, Omens, and apparent Miracles.' His notes to this work are of great value, and interesting. He also edited also an edition of Thomson's 'Seasons;' to which he appended a large number of notes, and a life of the author. He contributed many articles to the 'Cyclopedia of Practical Medicine.' He was for many years editor of the 'Medical Repository;' to which journal he also extensively contributed. One of his last works was entitled 'Domestic Management of the Sick-room,' of which several editions have been printed. A sketch of his life, from which his noble princely character may be obtained, is published with his posthumous work on 'Diseases of the Skin.'

THOMSON, THOMAS, M.D., a celebrated chemist, was born April 12, 1773, at Crieff, Perthshires, and received his early education at a private school in his native place. He afterwards studied at St. Andrew's and Edinburgh, and was a pupil of the celebrated Dr. Black. In 1802 he delivered a course of lectures on chemistry, and continued to lecture on that subject for nearly fifty years. He was one of the editors of the 'Encyclopedia Britannica,' from 1796 to 1800, and wrote the articles 'Chemistry,' 'Mineralogy,' &c. in that work. In 1802 he published his 'System of Chemistry.' He first suggested the use of symbols in chemistry, which was abandoned so generally as to be one of the first chemists who recognised the value of Dalton's atomic theory, and devoted himself to its elucidation. He also at this time conducted for the Board of Excise a series of investigations on brewing, which formed the basis of Scottish legislation on that subject. In 1813 Dr. Thomson came to London, and started the 'Annals of Philosophy,' a scientific journal, which he edited till the year 1822, when he resigned it to his friend Mr. Richard Phillips. In 1827 this journal became merged in the 'Philosophical Magazine.' In 1817 he was elected lecturer on chemistry in the University of Glasgow, and the following year received the title of professor. This chair he held till his death, and in his later years by his nephew and son-in-law Dr. R. D. Tait. In 1826 he delivered a course of lectures on botany in the University, and published 'Outlines of Mineralogy, Geology, and Mineral Analysis,' and in 1849 a work on 'Brewing and Distillation.' He died on the 2nd of July, 1852. His son, Dr. Thomas Thomson, succeeded for his botanical knowledge; he has published an account of his travels in Thames, and is now the superintendent of the East India Company's botanic gardens at Calcutta.

THICKLY RIVERS. [CANADA, S. 2.]

THIRTIF, the common name of the Statics Armeria, Smith, now Armeria maritima. Armeria belongs to the natural order Plumbaginae. It is distinguished by the flowers being in a head contained in an inverted cylindrical sheath, and not in a sort but borne in clusters. A. maritima, Thrift, is a common British plant, growing on muddy and rocky sea-shores, and on the banks of salt-water estuaries. It bears transportation to gardens, where it is a favourite in forming the borders of flower-beds. It may be easily distinguished from other species by its linear 1-nerved leaves. It has rose-coloured flowers. Several varieties are described.

THUREA. [Boswellia.] [TLIERS, S. 2.]

TIECK, CHRISTIAN FRIEDRICH, a celebrated sculptor, brother of Ludwig Tieck, was born in Berlin on the 14th of August, 1776. Having studied awhile under Schadow, he in 1796 proceeded to Paris, where he became a pupil of Bosio. In 1801 he returned to Berlin, and afterwards went to Weimar, then a great centre of literary and artistic activity. Here he found Götze a warm and most valued friend and adviser, and whilst here he not only assisted in the execution of the sculptural decorations of the new palace, but executed busts of Goethe, Voss, and Wolf, besides many of members of princely and noble families. In 1805 he went with his brother Ludwig to Italy, and carefully studied the great works of art there, maintaining at the same time by his numerous busts, &c., a family which is one of the most distinguished in Prussia. Here he became acquainted with the sculptor Calandre, Drobie, Augustus Schlegel, and M. Rocca. For Ludwig of Bavaria he executed at various times busts of Ludwig himself, Jacobi, Schelling, Ludwig Tieck, Lessing, Erasmus, Gottlieb, Herder, Wallenstein, and several others, chiefly for his gallery at Munich. In 1821 he became acquainted with Rauch, and the two great sculptors ever after remained fast friends. He returned in 1819 to Berlin, where he established his atelier, and was elected a member of the academy. During the remainder of his life he was employed upon many of the public works, and was a prominent actor in the artistic movements in the Prussian capital. Among his productions were the friezes, the sculptures in the pediment, and other external decorations of the palace of the Crown Prince at Potsdam; the angel in the porch of the Cathedral in Berlin; a series of fifteen seated marble statues of classical personages for the royal palace; a bronze equestrian statue of Frederick William at Kuppin, besides several monumental works and statues of celebrities. Tieck died in 1826. In 1827 Tieck died, not possessed of much imaginative power; he executed some good statues and reliefs, but his chief strength lay in his memorial busts, many of which display great elevation of style and admirable chiselling. In his studio several eminent sculptors have worked, among whom is the celebrated Carl Noack, the Kiss, the sculptor of the Amazon. There are casts of some of Tieck's works in the Crystal Palace at Sydenham.

TIECK, LUDWIG, one of the most influential actors upon the modern literature of Germany, was born in Berlin, on May 31, 1773. At the universities of Halle, Göttingen, and Erlangen, he studied with great aridour; history and the poetical literature of both the ancients and the moderns being his favourite pursuits. His poetical powers developed themselves early, but they took a direction opposite to the usual classical models, and exercised themselves on the feelings and opinions of what may be termed the German chivalry or romance of the Middle Ages, although his first efforts, 'Almamur,' a prose idyll, in 1790, and 'Alia' in 1791, gave a great stimulus to the national literature of eastern locality. Both displayed great poetical ability, but he did not attempt verse, except in a few short pieces introduced amid the prose. In 1792 he produced the tragical romance (The Parting), also in prose, which, like most of his other dramatic pieces, is more popular for the closet than the stage. He probably himself began to perceive that his true strength lay in narrative, and in the same year he produced 'Das grüne Band,' a medieval tale of considerable pathos, with great truth of characterisation and much interest; and 'Abdallah,' an oriental tale, with little of oriental colouring, and of a ghastly terror-insepiring character. He had made much progress in the study of English literature, particularly the drama, and in his 'Almamur,' and 'Alia,' he had already composed a paraphrase of Ben Jonson's 'Volpone,' in three acts, in which it is remarkable how carefully he has omitted all the more poetical passages which ornament the original, and in which, for the scene before the mayor of Padua, the popular parson, he substitutes a satirical one between an Englishman and a German author come to England for a few weeks to write volumes on the character of the country and its inhabitants. To the same period belong also his novel of 'William Liebig,' where the character of the author is represented as being in England, but they have a very foreign air, and the tone of the whole is more gloomy than most of Tieck's productions.

The last years of his life, from 1795 to 1800, both inclusive, was a period of incessant activity. During it he travelled; visited Jena, where he formed an intimate friendship with the two Schlegels, Novalis, and Schelling; Weimar, where
he became acquainted with Harder; and Hamburg, where he married the daughter of a clergyman named Alberti. The intercourse with the above-named literary celebrities had much influence on his future career. While still adhering to the romantic school, his productions embraced a wider field. He continued to write tales, novels, tragedies, and comedies; but in embodying nursery tales, as in his 'Blahnt,' a play in five acts, 'Die Sieben Weber der Welt,' and 'Das Hofvolk,' and many others, he exhibited the same manner of humour. Occasionally he took for his subject legends of a higher character, as in his 'Leben und Tod der heiligen Genoveva,' and in 1804, in 'Kaiser Octavianus,' a work which had been long neglected, and which his countrymen consider as one of the most successful of his romantic productions. To this he has prefixed a long prologue, in which various characters are introduced to display the proscenium element, and a poet, to whom comes Romance, a female, who describes herself as insinuating joy throughout the world, and says that her father is Faith, and Love her mother. In this prologue, and in the following play, which is partly in prose, is found the most famous specimen of Tieck's versification. It is not of the most careful construction; and the passages that are quoted as examples of an Art-loving Mind, written in conjunction with his friend Weckroeder, in all of which he displays a love and knowledge of the beautiful and elevated in art, a contempt for the self-complacency of affected connoisseurs, and a manifestation of a true poetical feeling, to which Faith and Love adhered about this period. Perhaps less distinctive as a class, as his previous tales had much of a similar character, were his 'Volksmährchen' (Popular Legends), such as the history of Heymon's Children, the 'Fair Magelone, Melusina, &c., legends which are European, and the 'Denkärdige Geschichtschronik der Schildbürger' (Memorable History of the Simpletons), a sort of German version of our Men of Gotham; tales in prose, abounding in pleasant fancy, interspersed with the merriment and gaiety which the readers of these tales so fondly love. He also became acquainted with the peculiarities of all the authors alluded to in that drama, would possess much interest for the English student. These pieces, independent of their critical merits, have an interest of their own from the wit and humour of the dialogue. Many of the productions of this period, including most of those above-mentioned, were subsequently published together, under the title of 'Phantasius,' a frame-work of a conversational party, to whom occurred the prologue of the 'Hans Sachs,' and the epilogue of the 'Don Quixote,' a very good one of Ben Jonson's 'Epicoene,' or the Silent Woman,' and a remarkably successful one of Shakspere's 'Tempest,' also belong to this period.

In 1795, Tieck wrote and published F. Schlegel in bringing out the 'Mussen-Almanach,' to which he contributed some of his tales. He then lived for a time at Berlin, and next at Ziegenburg near Frankfurt-on-the-Oder, seeming to enjoy a poetical leisure, during which he produced nothing but 'Kaiser Octavianus' of which we have already spoken, in 1804; and in the same year he made a journey to Italy, returning from thence in 1806 to Munich, where he had the first attack of gout, from which he never recovered. Tieck's style was so violent, that he produced little for several years. He occupied himself, when able, in revising and adding to his previous works, the 'Phantasian' as above stated, and a collection of his poems; in studying and collecting the early printed editions of the German classics, and in 1799 he published 'Minnelieder aus dem Schwäbischen Zeitalter' (Love songs of the Swabian period), and in 1815 'Uhrlehr's von Lichtenstein Frauenendienst' (Worth of Woman); and is extending his acquaintance with the English drama. In 1810 he published a volume of his own translations of the old King John, the Pinder of Wakefield, Pericles, Locrine, the Merry Devil of Edmonton, and the old Lear, all of which he contends are the genuine, though chiefly early, productions of Shakspere. In 1817 he published two volumes of specimens of the early German drama, and in the same year visited England for the purpose of acquainting himself with the literature connected with the dramas which he could not procure in Germany. He laboured diligently; the treasures of the British Museum as well as those of many private collections were opened to him; and it is probable that no foreigner ever attained so wide and so exact an acquaintance as Tieck with the English literature of the great Elizabethan period, or so just an appreciation of Shakspere's genius and Work. Tieck, with his love of poetry and discovery of beauties hidden from Englishmen in the apocryphal or rejected works attributed to Shakspere, in the genuineness of nearly all of which he is a stanch believer, but with his clear and impartial judgment, has formed a more sober judgment. On his return to Germany he settled at Dresden, and for some time his literary publications were chiefly novels and tales for the pocket-books and similar annuals. In 1821 he published the first volumes of 'Shakspere's Werke,' which is the first complete edition of Green's 'Friar Bacon,' 'Arden of Faversham,' of which he has doubt whether it is a production of Green's or an early work of Shakspere, and Hoywood's 'Lanashire Witches;' and in 1823, 'The Death of King Lear.' This last publication containing 'Fair Em,' 'The Second Maid's Tragedy,' by Musseniger, translated from one of the three manuscript plays saved from the fire by Warburton the herald, and the Birth of Merlin: the first he considers to be more probably an early effort of Shakspere's than any of the other names to which it has been assigned, grounding his opinion of this and other of the doubtful plays on the belief that Shakspere commenced writing for the stage many years earlier than had at that time been admitted; a belief which is now generally established. In 1817, a collection of reviews or criticisms of modern German plays, including notices of Sottier's 'Picolomini,' and Wallenstein's 'Tod,' Göthe's 'Jery und Bäutele,' and Clavigo; and Shakspere's 'Romeo and Juliet,' 'Lear,' 'Henry VIII,' 'Macbeth,' and 'Hamlet;' all containing much genial criticism, with a delicate and true apprehension of their poetical feeling and harmony; with notices of the acting of Kemble and Keenan; and Appendices on the German and English stage. Above all, it may be said, that 'Zahrt's Travels' was an active part of the passage of the fifth act of Shakspere's acknowledged plays, which had been begun by Schlegel, and of which the first volume appeared in 1825. The merit of this translation, of which many were entirely from his own hands, and all were subjected to his revision, are universally acknowledged. Less literal, but more spirited and equally true to the sense of the author, than the previous translation by the Vosses, they are illustrated by a number of notes which display a great amount of learning and research. They are the work of the editors to various disputed readings, and they now form the recognized text of Shakspere's plays in Germany. The work was completed in 1824. But his labours were not confined to this vast undertaking; he prepared several new editions and translations, and in 1825 he published his novel 'Dichter' leben,' (Life of a Poet) in which Shakspere and several of his contemporaries are introduced, and in which the death of Marlow is vividly described. In 1826 he published 'Der Tod des Dichters,' (the Poet's Death) in which the
unhappy fate of Canoens is pathetically related. In 1826 he also produced one of his most picturesque narratives, 'Tters kther', a story of the insurrections in the Gennes regions is graphically told, but unfortunately left incomplete. While residing at Dresden his evening circles became celebrated, at which his readings and the relation of his tales formed a principal charm, and which were attended by the literary circles, who were much in the vicinity and could gain admission. In 1836 and 1840 he published his two latest novels—'Der Tischlermeister' (The Cabinet-maker) and 'Victoria Accorbona', both of which are of the highest importance to many of his previous works of a similar character. He also took an active part in the management of the Dresden theatres. In 1840, on the accession of Frederick William IV. to the throne of Prussia, Tieck was invited to Berlin, an invitation which he accepted; he afterwards created him a Privy Councilor, and passed the remainder of his life partly in Berlin and partly at Potsdam, occupied chiefly with some theatrical productions, and in revising and correcting his works, which were published in 20 volumes at Berlin between 1839 and 1849. At various times he also edited Novalis's 'Schriften', in conjunction with Friedrich Schlegel, 1802; Heinrich von Kleist's 'Nachgelassenen Schriften' (Posthumous Works), 1826; Solger's 'Nachlass und Briefwechsel' (Remains and Correspondence), 1826; the 'Reinhard Lens's Gesammelten Schriften', (Collected Works) in 1828. After suffering for some years from continued illness, borne with wonderful patience and cheerfulness, he died at Berlin, April 28, 1855, leaving a name which may rank with the highest in his native land and in the Englishmen may reverence as that in which is Germany is most connected with the popularising of the fame of the great dramatic poet of England.

TIL, a genus of Plants belonging to the natural order Cruciferae. It has a 3- or 4-parted calyx; petals 3 or 4, oblong acuminate; scales none, or very small; carpels 3 or 4, somewhat constricted in the middle; 2-seeded. The species are small glabrous annual herbs, in erect, slender, slender, pubescent and pubentulous places. The leaves are opposite. Flowers small, white, for the most part axillary.

T. muscosa is a native of Europe in many places, in dry, barren, sandy, and gravelly soil; plentiful in Britain on the most barren sandy heaths, and frequent in Norfolk and Suffolk. It has a stem branched and decumbent at the base; flowers axillary, sessile, and trifid. The plant is very minute, and of a reddish colour. The leaves are opposite, oblong, obtuse, concave above, connotate; sepal ovate, acuminate, bristly-pointed. Petals nearly subulate, white, tipped with red. There are several other species, natives of North and South America and Australia.

TOAD. (Boraciac Acid.)

TINEI.ZE, a family of small Moths, which are remarkable for depositing their eggs among animal substances, on which their larvae afterwards feed. They are thus constantly upon clothing made of hair or fur, and are called Clothes-Moths. The family is thus defined.---An

temperate moderate, slender, simple, pubescent beneath in the male; proboscis short; thorax rarely crested; body long and slender; wings entire, often narrow, maily convoluted in repose. The caterpillars live in portable cases formed of various materials.

These moths are often ornamented with very brilliant colours, the upper wings having golden or silver spots. The caterpillars make their cases of the substances on which they feed, and make their nests of bits of leaves. The true Tineae are the theme of the hair of the skins of animals and bits of silk. When too small, they slit their cases and make them larger. Many of them burrow into skins, silk garments, &c., making cases as they proceed. The genera and species are very numerous.

(Weevil. Entomologist's Textbook.)

TIPTON. (Staffordshire.)

TIPULID.E, a family of Dipterous Insects belonging to the order Diptera. They have the antennae longer than the head, simple, not divided into two parts. The whole body, except the legs, is covered with fine silvery hairs. The proboscis is short, ending in two large flasky lips; body elongated; wings long, nervures numerous; legs long.

The name is given to the species of Cephalopod, Pedicul, and the species of Tipula which are usually known by the name of Daddy-Long-Legs.

LaBelle divides this family into five smaller groups—Caliciformes, Galliiloze, Terielleos, Fungivores, and Florae.

The Caliciformes (Chironomidae, Macquart) include those forms the pupae of which mostly dwell in the water, respiring by means of external tubes or filaments situated in front of the body. They have also a large bow of swimming hair, which are transparent, and form exceedingly beautiful objects for the microscope. The larvae of Chironomus plumosus are vermiform, and of a blood-red colour, whence they are called Blood-Worms. (Chironomidae.)

The Galliiloze (Cecidomyiidae) include those species which form galls by depositing their eggs upon plants. (Cecidomyiidae.)

The Fungivores (Myxophtharia, Macquart) embrace an extensive and active group of these insects, which are capable of leaping by means of their hind legs. They are found in damp situations amongst various plants. They enter houses, and are found upon window-panes. They are said to be partial to Fungi, hence their name. They are generally found in the interior of Boleti and Fungi.

The Terielleos (Tipulidae, Macquart) are the true Crane-flies. The species of the genus Tipula are found in damp meadows in great numbers, especially in the autumn. The species of Tipulum are found in grassy places, various trees, etc., and occasionally they do much harm. Mr. Westwood remarks that the male Daddy-Long-Legs is very quarrelsome, and often fights with his brethren of the same species.

The Florae (Bibionidae, Macquart) are distinguished by having the body and legs shorter and more robust than the other forms. The species are small, and their flight is slow and heavy.

(Weevil. Families of Insects, TOLMORDEN. (Lancashire.)

TOLLENS, HENDRICK CORNELISZON, long the most popular living poet of Holland, was born at Rotterdam on the 24th of September 1780. His father carried on a thriving business in textiles, which he added to. Little by little, the business was extended, and Tollem earned from it. At the age of fourteen he was sent to the university at Amsterdam, where he lived for some months, then left for Paris, and in colours, and Hendrik was taken from school at the age of seventeen, made the acquaintance of two poets, one of them, Heimers, a merchant, the other, Loots, a schoolmaster. Hendrik was introduced to them by a friend to whom they introduced him, was a respectable bookseller. Hendrik had learned some French at school; by Ulyenbrock's advice he now studied English and German, and thus enlarged his ideas; he failed he following Ulyenbrock's example in occupying himself with rendering French tragedies into Dutch verse. He afterwards ventured on original dramas, and his 'Lucretia,' written in 1805, had, at all events, sufficient spirit to be prohibited by the government. Another tragedy, 'De Hoogen en Kabeljauwonens' (The Hooks and the Codfish), had, at least the merit of a national subject, being founded on the quarrels of the rival factions of these names, the Geuzhs and Ghibelines of Dutch medieval history, whose hostilities, which lasted a century and a half, are said to have arisen in 1530 from a jeer dispute between some nobles at a banquet as to whether the codfish could be said to take the hook, or the hook the codfish. Tollem's powers, however, did not lie in tragedy. In two contests with his friend Loots on subjects offered for prizes, one on the theme Hugo Grozus, and the other the death of Egmont and Hoorn, he won the second prize on the first occasion, and the first on the second; and in 1807 a short poem by him 'To a Fallen Girl,' attracted the attention of the French emperor. His other subjects were almost universally taken from national history and from domestic scenes, and though even his admirers did not place him on a level in point of genius with Bil-

'3187. The 1st edition of the
his poems had 10,000 subscribers; not long afterwards his fellow townsmen proposed to erect his bust in a public place, and it was only the reluctance of Tollens himself which prevented the celebration from taking place. Altogether the subscription was already full. This popularity increased as he grew more advanced in life. On his seventieth birthday, the 24th of September 1850, the minister of justice, Mr. Nederomeijer van Rosenthal, waited on him at his house at Haarlem, and, in the name of the municipality of Holland, and present to him the insignia of commander of the order of the Dutch Lion, a very unusual honour for a literary man. A committee waited on him the same day to offer him a gold medal, with the inscription: "Nederland zijnen geliefden Volksdichter" (Netherlands to its beloved national poet), and to inform him that a subscription had been organised, without his knowledge, for the formation of a 'Tollens Fund,' to commemorate his name by a charitable institution, to be left to his own choice. He died in 1856, surrounded by universal respect.

The shorter poems of Tollens, lyrical and narrative, are his chief title to remembrance. One narrative poem, 'De Overwintering der Hollander op Nova Zembla,' (The Wintertaking of the Hollander on Nova Zembla), commemorative of the celebrated voyage of Barents in 1596-97, is very popular and has often been reprinted, on one occasion in an illustrated edition with engraving on steel. In 'The Days' Sea-Fight,' commemorative of one of the desperate contests between the Dutch and English in the reign of Charles II., may be compared for spirit to his friend Loots's 'Overwinnin bij Chatham' (Victory at Chatham), a poem of 1677. In 'The Days of the English' he is a fertile author of ballads on subjects of Dutch history, among which his 'Jan van Schaaffelaar,' 'Kanaal Hasselaar,' &c., are conspicuous, his 'Vapenknecht' ('Call to Arms'), written on occasion of Napoleon's return from Elba, is one of his best productions. Tollens translated much from the German and English as well as the French, but often adapted the pieces he borrowed to Dutch subjects or history. An English reader would hardly suspect before reading it that some of them are Dutch, which most remarkable of the 'Young Lochinvar,' which has also been done into Dutch by Van Lennep, under the title of 'De Heer van Caulemborg.' Tollens's works, of which a new edition is now publishing, are of some extent: his shorter poems alone occupy about ten 8vo volumes, not very closely printed.

TOLUOE. [CHEMISTRY. S. 2.]

TOOKE, THOMAS, one of the two sons of the Rev. William Tooke, was born in 1773. He published in 1838 'The voyage from the Cap of Good Hope to the Cape of Good Hope from 1793 to 1837, preceded by a brief sketch of the State of the Corn-trade in the last two Centuries,' 2 vols. 8vo. The treatise comprised in these two volumes, though apparently an enlargement and continuation of one published about fifteen years before, contained new and important details. In the following years he wrote a work on "The History of Prices," 4 vols. 8vo. A History of Prices and the State of the Circulation from 1839 to 1847 inclusive; with a General Review of the Currency Question, and Remarks on the Operation of the Act of 1844, Mr. Tooke afterwards published a tract, in which he was assisted by Mr. Newnham, 'On the Bank-Charter of 1844, its Principles and Operation, with Suggestions for an Improved Administration of the Bank of England,' 8vo. The last two volumes of his great work were 'A History of Prices and the State of the Circulation during the Nine Years 1848-1856, in Two Volumes, forming the Fifth and Sixth Volumes of the History of Prices from 1792 to the Present Time, by Thomas Tooke, F.R.S., Corresponding Member of the Institute of France, and William Newnham,' 8vo., 1857. The sixth and eighth volumes, besides being a continuation and completion of the work, arranged under the heads Prices of Corn, Prices of Produce other than Corn, and the State of the Circulation in the different parts of the United Kingdom, the System and progress of the Free-Trade Movement, the State of Finance and Banking in France, and the New Discoveries of Gold. Mr. Tooke died in London, Feb. 26, 1846, being then within a few days of his 74th year. His younger brother, Tooke William, F.R.S., is still living.

TOOTH-TISSUE. [TISSUES, ORGANIC, S. 1.]

TOOTTING. [SUBURB.]
The amnesty of 1832 restored him to Spain, but he was not permitted to reside in Madrid till after the death of King Ferdinand. In 1834, on the promulgation of the 'Estatuto Real,' by Queen Christina, on the recommendation of his friend, Martínez de la Rosa, he was named Minister of Finance. The pro-sisipha of finance occupied his attention almost exclusively for some time, and prevented his sharing the unpopularity of his chief, so that, when in 1835 Martínez de la Rosa was compelled to retire, Toreno succeeded to his post. He resigned, and emerged as a liberal in 1837, when he was elected to the constituent council. Unfortunately for himself he admitted to his own post of minister of finance Mendizabal, who, with his dazzling schemes, soon threw him into the shade. Toreno, who was now decidedly a 'Moderado,' grew more and more distinguished, and was in frequent correspondence with Mendizabal, and allied to persevere by forcible means, but his colleague thwarted him, and the country was not with him. In September 1835 he was driven to resign, and Mendizabal succeeded as head of the cabinet. On a dissolution of the Cortes, Mendizabal was returned by the electors of seven different places, and Toreno and Martínez de la Rosa were left without a seat. The disgraceful revolution of La Granja followed, the constitution of 1812 was proclaimed, and Toreno, now far declared openly and hopelessly a liberal, he expected to resume his historical studies in Paris and London, where he brought his history to a conclusion, at the time that in Madrid he was sentenced to forfeit all his honours and estates. In a few months, however, he was again allowed to return to Spain, and in the following year the Cortes, in the last days of the first government, in Germany and Italy, was in Paris, on his return, it is said, to Spain, when seized with a cerebral disease, which carried him off in a few days. He died at Paris on the 16th of September, 1845, but his remains were conveyed to his country, and his ashes were laid in the church of Sta. Maria la Real, at Madrid.

Toreno's 'History of the Insurrection, War, and Revolutions of Spain' ('Historia del Levantamiento, Guerra, y Revolución de España'), is the great Spanish work on that interesting subject. That it is a Todeal of a tour in Germany and Italy, was in Paris, on his return, it is said, to Spain, when seized with a cerebral disease, which carried him off in a few days. He died at Paris on the 16th of September, 1845, but his remains were conveyed to his country, and his ashes were laid in the church of Sta. Maria la Real, at Madrid.

He died at Paris on the 16th of September, 1845, but his remains were conveyed to his country, and his ashes were laid in the church of Sta. Maria la Real, at Madrid.
in front; legs of equal size, short, ending in two hooks. *Chelif er cancris* found in herbriums, old books, etc., where it feeds upon the minute insects which frequent such situations. Family 3. *Phalangidae*, Shepherd-Spiders.—Mandibles very conspicuous, composed of two or three pieces, free, ending in a didactyle pincer; palpi filiform, ending in a hook; body short, rounded; abdomen segmented; legs elongated; habitually comprises the well-known form called *Harvest-Man*.

Sub-Class III. *Aperoranchiata*. This sub-class includes the genera *Nymphon* and *Pycnogonum*, which are the type of the orders *Nymphonidae*, the Sea-Spiders, and *Pycnogonidae*, Parasitio Sea-Spiders. These are often referred to the class *Crustacea*.

**TRACHYPHONUS. [Woodpeckers.]
**

A genus of *Fish* belonging to the riband-shaped forms of *Acantopharyngi*. The body is elongated and compressed; dorsal fin extending the whole length of the back, a few of the anterior rays sometimes elongated; vertical fins fragile, if not worn or broken, rather long; no anal fin; caudal fin—rays rising almost vertically from the horizontal line of the vertebral column; a row of small spines along the lateral line. T. Bogmarus, the Vagmnaer, or Deal Fish, is described by Dr. Fleming in the 'Magazine of Natural History.' He was taken in the North Sea, but of late has been much frequent in occurrence in Scotland. The species found in the north of Europe differ from those of the Mediterranean. One species only has been recently caught alive at Sunda in the Moluccas, where the length of the body is excessively compressed, particularly towards the back, where it does not exceed a table-knife in thickness; breadth nearly five inches, tapering to the tail; colour silvery, with minute scales, the dorsal fin an orange colour, occupying the whole ridge from the head to the tail, with the rays of unequal size; head four inches and a half long, compressed like the body, with a groove on the top; eyes one inch and a quarter in diameter: both jaws armed with small teeth. Various species, probably to the number of a dozen or more, appear to have been obtained on the island of Sunda between 1817 and 1839. The Vagmnaer is rare in Iceland. It differs from the two species found in the Mediterranean, T. fals and T. iris, and also from T. lepisorus.

**TRADE, BOARD OF.** The functions of this branch of the Privy Council have been of late years considerably extended, its duties being some of them of a ministerial, and others of a judicial character. It has the general supervision of matters relative to merchant ships and seamen, and the carrying into execution the statutes in force relating to them. For that purpose it has to require and receive various kinds of returns as to trade and navigation, and order, and consider reports made to it by its inspectors and other persons concerned therein. Working conditions, wages of seamen, strength and condition of steam-vessels and their machinery (14 & 15 Vict. c. 79). The Board of Trade exercises a supervision over railways and railway companies, not only with respect to their original formation, but also as to their subsequent working. Railways were first placed under this control by the statute 3 & 4 Vict. c. 97. A few years afterwards the powers of the Board in this respect were transferred to a Board of Commissioners of Railways; but in 1851 all the powers of this latter body were transferred to the Board of Trade, and the Railway Act of 1844 was enacted into law. Any person may present a report to the Board of Trade, or to the Board of Commissioners of Railways, of the condition of the railways within their jurisdiction.

**TRADE, SHIPPING, AND CURRENCY.** In the article *Trade* in the *Encyclopedia Britannica* we have given the official and declared value of the imports and exports, with the number of ships and amount of tonnage engaged in the trade of the country, down to the year 1836. The values of imports and exports as given in the report for 1854, differ in a high degree from the official valuation, which was very fallacious. The extent of our commerce has been constantly increasing, but without going through the details of each year, we shall give only summaries of 1854, 1855, and 1856, for which the official report is a report in a highly improved form; and for 1857, which is only a preliminary return, and somewhat less complete.

**Trade.** The real value of the total imports into the United Kingdom in 1854 was 152,383,059L.; in 1856 it was 195,424,564L., and in 1856 it was 172,944,154L. These values are computed from the average prices fixed for the articles, which are chiefly entered by quantities at the Custom House. The value of the exports is obtained from the declared value set on the ships' despatch from the three years show less discrepancy; they were 124,136,018L., 117,254,881L., and 131,937,763L.

Our largest importations in 1856 were from the United States of America; they amounted to 36,047,736L. from Russia they were 11,661,924L., from France, 10,386,522L., from China, 9,421,681L. from Japan, 8,906,904L. from Holland, 7,433,442L. from the Hanno Towns, 5,305,739L. from Prussia, 4,534,815L. from Spain, 3,565,083L. from Belgium, 2,936,790L. from Spanish West Indies, 2,654,680L. from Denmark, 2,201,831L. from Portugal, 2,164,909L. from Sweden, 2,031,861L. from various states of South America, Central America, and Mexico, 9,736,381L. from the Western Coast of Africa, 1,657,317L. (this commerce has doubled itself within four years). From the Two Sicilies, 1,505,582L. from Greece, 1,427,289L. The imports from other countries are each under a million. The total of imports from foreign countries is 129,617,688L. The amount of importation was from the East Indies, 17,262,831L. The other principal amounts were,—the North American Colonies, including Newfoundland, 6,335,770L., the Australian Colonies, including New Zealand, 5,706,043L.;
the West Indies, 4,157,088 lb.; Mauritius, 4,247,007 lb.; Cape of Good Hope, 1,652,928 lb.; British Guiana, 1,416,284 lb.; and other colonies, 33,300,446 lb. The total value of the exports from British possessions of the value of 43,026,568 lb.

Of the exports, the total value taken by foreign countries in 1856 was 82,325,901 lb., and by British possessions, 33,300,446 lb. The British colonies and islands were our largest customer, to the value of 21,918,105 lb.; and they were the British colonies and islands.

Then follow the Hanse Towns, 10,134,830 lb., Turkey, including Syria and Egypt, 6,340,492 lb.; France, 6,432,650 lb.; Holland, 5,728,253 lb.; Brazil, 4,084,537 lb.; Spain, 1,743,488 lb.; Belgium, 641,604 lb.; Honduras, 414,671 lb.; China, excluding of Hong Kong, 1,416,747 lb.; Chili, 1,396,461 lb.; Cuba, 1,517,062 lb.; Two Sicilies, 1,205,183 lb.; Sardinia, 1,413,689 lb.; Sweden and Norway, 1,118,185 lb.; Denmark (including Holstein, &c.,) 1,094,280 lb.; Peru, 830,546 lb.; and other places above a million. Of the British possessions receiving exports, the largest export was by the East Indies (including Ceylon and Singapore), 11,607,436 lb.; Australia (including New Zealand), 10,173,240 lb.; North American Colonies (including Newfoundland), 6,410,228 lb.; British West Indies (including Guiana), 1,873,297 lb.; Cape of Good Hope and South Africa, 1,344,338 lb.; these are the only places that exceed a million, but Gibraltar takes the analyze, and the exports to the amount of 6,322,430 lb., which is considerably less than a half of the British increase. The total amounts also in 1856 were 7788 British ships with a tonnage of 1,304,453 entered in ballast; and 767 foreign ships, of 671,161 tons entered in ballast. The first ships cleared out in 1856 were 16,167 ships, 3,113,35 tons, with cargoes, and 3335 ships, of 577,553 tons entered in ballast; and in 1856 there were 17,363 ships, of 5,777,657 tons entered in ballast; and 711,161 tons entered in ballast; all the items showing a great preponderance in the increase of the British trade in their ports, notwithstanding the greater facilities offered to foreigners by the repeal of the old navigation laws. The returns include both steam and sailing vessels. Of its foreign vessels with cargoes, the greatest number in 1856 was from Norway, 2295 ships, of 486,744 tons; the next highest number was from Denmark, 355 ships, but only 194,698 tons, or less than one-third of the Dutch trade, which was 1,210,102, of whom the Netherlands, 1210, the United tonnage being only 462,460; the ships being entered to the low shores of Holland and the shallows of the North Sea; but, crossing the Atlantic, the United States, 130,365, ranked next in the list, and their tonnage was 1,376,631, approximately to a thousand less for each vessel. The burthen of the whole number of 18,51 British ships was 5,086,283 tons, an average of very near 280 tons for each. The total number of registered vessels, sailing and steam, was 30,012 in 1856, 1,315, of which the tonnage was 5,312,436, and the crews numbered 267,573 men, but this included the Channel Islands, and colonial possessions. In the British islands there were 6749 sailing vessels not exceeding 60 tons burthen, 5,428 vessels of 60 tons burthen and upwards, and in a total of 76,952 thousand tons, and 1,207,102 tons burthen, with 53,579 men, and 317 steam vessels, of 61,616 tons burthen, and 4694 men. Partly in the Home and partly in the Foreign Trade there were employed 26,958 sailing vessels, of 102,448 tons, including 61,512 tons burthen, with 53,579 men, and 317 steam vessels, of 16,102 tons burthen, and 963 men. In the Foreign Trade there were employed 8039 sailing vessels, of 2,942,674 tons burthen, and 110,716 men, and 492 steam vessels, of 247,377 tons burthen, and 1,745 men. In the United Kingdom, of which 921 were sailing vessels, and of these 33 were of iron, of an aggregate tonnage 187,005, and 229 steam vessels, of which 175 were of iron, with an aggregate tonnage of 67,575. In 1857 there were 921 steam vessels, of 262,786 tons, and 232 vessels were built and registered, of which the tonnage was 172,656, and there were 67 foreign-built vessels, tonnage 11,384.
registered at various ports of the United Kingdom. There were also 69 steamers and 6 sailing vessels built during the year for foreigners, the tonnage of which amounted to 14,061. There were 754 vessels wrecked during the year, 110 broken up, and 149 sold to foreigners, the tonnage of the whole, 249,459.

In the Coasting Trade in 1856 there were entered with cargoes (in ballast are omitted) 156,506 British vessels, tonnage 53,489; there were cleared, likewise with cargoes, in the same period, 156,006 British vessels, tonnage 15,288,329, and 370 foreign vessels, tonnage 55,555. For the United Kingdom there entered 157,706, vessels, tonnage 131,744, and cleared 131,744, sailing vessels, and 24,735 steamers. The foreign sailing vessels entered numbered 288, the steamers 19; the number cleared was 315 sailing vessels, and 29 steamers.

In 1857 the number of British ships, including sailing vessels and steamers, entered inwards with cargoes, was 18,091, the tonnage 6,418,090; the foreign vessels, 13,602, tonnage 3,314,090. Cleared outwards, there were 24,834 British vessels, tonnage 6,204,198; the foreign vessels 10,4, tonnage 3,356,201. The number of ships in ballast is not stated. Of the ships entered inwards Norway and Denmark still have the greatest number, Norway 2080, and Denmark 2311, while the United States sent out only 561 vessels, more than 2500, and Great Britain 1363 entered, 1,214,464, a decrease of 164,167 tons. But though France only entered inwards 1122 ships, tonnage 90,038, she cleared out 4410 vessels, tonnage 473,589; Denmark cleared out 3141 ships, tonnage 316,625; Norway cleared out 2995 ships, tonnage 379,078; and the United States, 1292 ships, tonnage 1,296,934. The number of ships employed in the Coasting Trade was 129,401 entered inwards, tonnage 12,979,069, of which 316 were foreign vessels, tonnage 68,619; cleared outwards, 144,836 vessels, tonnage 14,098,429, of which 247 were foreign vessels, tonnage 434,114.

Currency. At Michaelmas, 1837, the amount of Bank of England notes and post bills in circulation, was 17,096,610l; the value of coin and bullion in hand was 3,656,415l. The amount of the notes of the Bank of England, joint stock banks of England and Wales was 10,142,049l; of which 3,701,996l were those of Private Banks, and 3,440,034l those of Joint Stock Banks. In the year gold to the value of 1,233,688l, silver to that of 78,111l, and copper to that of 90,961l, had been coined. In July, 1844, Sir R. Peel's Bank Restriction Act (7 & 8 Vict. cap. 32) was passed for regulating the issue of paper money. By this act, the Banking Department of the Bank of England was separated from the Bank itself, and the Bank was allowed to supply the deficiency of the currency, subject to a limit of 14,000,000l, to be taken by the Issue Department as security for a like amount of notes, and any further supply could only be obtained by a deposit of the value in bullion, and the return of the notes to an equal amount. The bullion to be valued either in receipt or payment at 37 17s. 9d. per oz., at which rate all persons may demand notes for bullion from the Bank of England. Private Banks, not previously noting such notes, were restricted from commencing, and those which had done so, were prescribed as to the amount to be issued, and were required to furnish returns monthly. Bankers ceasing to issue were not allowed to resume, at the Bank of England, under certain regulations, but were not allowed to issue anything but their own private millions by an amount not more than two-thirds of the private issue that had been discontinued. On January 4, 1845, the amount of notes issued to the Bank of England was 28,087,054l, of which 8,168,125l remained in possession; and the bullion in both departments amounted to 14,801,621l. The notes of Private Banks in England amounted to 4,277,117l, of Joint Stock Banks to 559,493l, of the various banks of Scotland to 3,135,401l, and of the various banks of Ireland to 21,452l. The highest point of the current monetary pressure was experienced, and on October 3, the temporary suspension of the Act was ordered by the First Lord of the Treasury and the Chancellor of the Exchequer (Lord John Russell and Sir G. Canning). The suspension for four months had severally been 37 days, and the resumption of the suspension relieved the pressure, and the order was withdrawn on November 23. The act worked smoothly until the American failures, in the autumn of 1857, occasioned a pressure in the United Kingdom. The rate of discount was rapidly raised to 10 per cent., and on November 12 the restriction was again suspended. An issue of 2,000 notes at 10 per cent. were issued, was sufficient to restore confidence, and by February, 1858, money had sunk to its ordinary value. We subjoin the following returns to show the contrast. On November 11 the notes issued to the Bank of England amounted to 21,051,063l, and those in circulation to 20,183,324l; so that there only remained 957,711l in notes in its coffers; and the amount of bullion was reduced to 7,110,908l. In the return for November 18, the additional issue of the two millions was included; the notes quartered amounted to 22,654,653l, those in circulation to 21,406,410l; the notes unemployed to 1,148,185l; while the bullion had sunk to 6,484,096l. The note issue of the Private and Joint Stock Banks varied but little during this period. The two millions were returned by the Bank of England and the Issue Department by December 30, and on February 17 the notes from the Issue Department amounted to 31,294,810l; those in circulation to 19,453,614l; those unemployed to 341,930l; and the bullion to 17,823,251l.

The coinage, particularly that of gold, has been very large for several years. The following are the amounts of each description of metal for the respective years:

Commercial bills form a large part of the Currency of the kingdom; the average amount held under discount by the Bank of England is about 16,000,000l; those discount by depositors is about 16,000,000l. In the commercial panic, beginning in America, caused the rate of discount to rise from 6l per cent. in July, by rapid steps, to 10 per cent. for a few weeks. By February, 1858, the rate of discount had fallen to 3 per cent. The value of the gold and silver bullion exported in 1857 was 33,566,984l; of which 15,061,995l was in gold, and 18,504,989l in silver. Of the gross sum 10,833,916l. In gold, and 40,901,92l in silver, were remitted to the Bank of England. The Bank of England received a total of 935,686l, the greatest amount in gold; and the United States, 859,110l, all but 15,980l in gold.

TRANSPORTATION. [SERVITUDE, PEKUL, S. J.]

TRAYNIK. [BOYNIK.]

TREE-ERN. [CATH ERA, S. I.]

TRIADONOD. [SQUALIDUS.]

TRIAXIS. [SQUALIDUS.]

TRILICHOES. [SQUALIDUS.]

TRILLACIES. [SQUALIDUS.]

TRILLACIES, the natural order of Plants belonging to the class Diitocygnaceae. They are distinguished by their bisexual tripetaloid flowers, half-consolidated carpels, and axile placentae. Lindey gives the relations of this order with Simencaceae, Roscofgeaceae, Cynanaceae, and Melanchaceae. It contains 4 genera—Poraria, Denticula, Trillium, and Medeola. The species are found in thickets in the temperate parts of Europe, Asia, and North America.

TRIPLODEMA, a genus of Plants belonging to the natural order Stylariales, of a peculiar suborder Pupilionaceae. The species are natives of warm climates, and yield the Rose-Wood of commerce.

TRITIEN, FREDERICK HENRY, a distinguished German and Russian scholar, was born in February 1820 in Switzerland, and educated in Moscow, where at a few years old to Odessa, his father having accepted the situation of professor at a Russian college in that city. At Odessa he received an excellent education and had ample opportunities for making himself acquainted with the

4 U
modern languages, of which French, English, and German were as familiar to him as Russian. He had carried on his studies, and took his degree of doctor of philosophy, he was distinguished for his knowledge of Greek, and he studied Sanscrit under Bopp. After passing some time in Poland, where he made himself master of Polish, he returned to England, and, from 1824 to 1831, was teacher of modern languages at Rugby, under Dr. Tait, the present bishop of London. He then began to contribute articles, chiefly on subjects connected with Sanscrit literature, to the 'Penny Cyclopedia' and the 'Quarterly Journal of the Society for the Diffusion of Useful Knowledge.

In 1844 he was appointed one of the assistants in the Printed Book department in the British Museum, and was partly employed in cataloguing the Slavonic and Eastern Armenian libraries, in which languages a large stock had then recently been added to the Museum library. In coming to the Museum, he had indulged in expectations that its talents and acquirements would probably attract the notice of the Trustees with the effect of bringing encouragement and promotion, and he was deeply disappointed to find that such expectations were futile. He accepted in 1845 the post of private tutor in the family of Prince Chernischew, the Russian minister of war, and went to Russia. Peterborough, where he returned to England after an absence of about two years, part of which he had passed at Constantinople and Cairo, and in 1848 published at London an edition of the 'Maha Vira Charita,' or the 'Great Hero's Tale,' in Sanscrit. His friends suggested to him to offer himself as a candidate for the professorship of modern European languages in the Taylor Institution at Oxford, which was then on the point of being set in motion. The professor, it was decided, was to be appointed at first for five years only, but with the capability of being re-elected; his post was to be one of influence and authority, the rest of the officials of the institution being placed under his directions, and his salary was to be £400, a sum which in those days was a considerable one. Dr. Trithen, who had already post in 1848 in preference to some very able competitors, and contrary to his own expectations, and entered upon his duties with a lecture 'On the position occupied by the Slavonic dialects among the other languages of the Indo-European family,' which he afterwards printed as an essay in the 'Proceedings of the Philological Society of London,' of which he had been a member since 1843. The career of usefulness and honour which now seemed to lie before him was suddenly cut short about the middle of 1850 by an attack of fever, and he came to England, where, in 1841, he found it necessary to put him under restraint. It was reported at the time that the immediate cause of the disorder was that a lady to whom he had paid his addresses had given him the coldly contemptuous answer that he had he previous occasions been remarked in his conduct. His father came to England, and in 1851 removed him to Odessa, where he remained in a hopeless state till April 1854, when the city was under apprehensions of bombardment from the English. Trithen was then removed to a village at a few miles distance, where an unexpected change in his disorder took place, and he recovered his mental powers as suddenly as he had lost them, but this was only a 'lightening before death.' After expressing a strong desire to return to England, it became evident that his bodily strength was failing, and he expired on the 27th of April 1854. He left behind him no adequate monument of the extent of the powers which his friends knew him to possess, but among his biographers theDictionary and Cyclopedia and Dictionary are of a sound, and solid character, and his scholarship was not only accurate but remarkably ready. The power which he possessed of conversing with ease and in more than one of the Teutonic, the Romanic, and the Slavonic languages qualified him in an eminent degree for the professorship to which he was chosen.

TRIDRACEA. Tillandsia, a small natural order of plants belonging to Linnaeus's class of Monocotyledons. They have the diotygenous structure, unisexual flowers, a soft and rather friable substance known as calyculin, and numerous 1-seeded carpels. There are only two genera, Triginta and Peltophyllum. The species of these plants were first correctly described by Mr. Miers and Mr. Gardner in the woods of Brazil, where they are seen in great numbers in the long- held relations are with Scillastrum, Mentispermaceae, and Tritricaceae. 

TRIOSTIE. [MINERALOGY, S. 1.]

TROY. Thomas Wilde, First Lord, the son of a respectable solicitor in Warwick-square, London, and Safron Walden, Essex, was born in 1832, and received his early education at the London Grammar School. He was articled to a clerk in his father's office, and having been admitted an attorney in 1858, practised for some years as a partner in the firm of Wilde and Knight, in Castle-street, Finsbury-square. In 1857 he was called to the bar, and went the Western Circuit. He was successively appointed attention to his profession, and in 1861, was engaged as a junior in the defence of Queen Caroline, which tended materially to increase his professional reputation, though it retarded his advancement during the reign of George IV. In 1831 he was elected member for Newmarket, against the influence of the late Duke of Newcastle, and, though thrown out in December 1822, he regained his seat in January 1835, and retained it, as colleague with Mr. W. E. Gladstone, until 1841, when he was elected for Worcester. In 1839 he succeeded Sir M. R. Bowes, now Lord Crathorne, to the seat of Hayburn-le-Moor, which had been vacant since 1841. In 1846, on the return of the Liberal party to power under Lord John Russell, Sir Thomas Wilde was again nominated attorney-general, but within a week afterwards was raised to the bench as a Baronet, and placed in the place of Mr. N. Tindal. In July 1860 he received the great seal, and was at the same time elevated to the peerage as Lord Truro. He resigned the chancellorship on the retirement of his party from office in February 1852. The most remarkable cases in which he was professionally engaged, and before his elevation to the judicial bench were the trial of Queen Caroline, alluded to above, and the trial of the late Mr. O'Connell in 1844, to whom he gave his services without fee or retainer, and obtained a verdict of 'ho not guilty.' In Parliament his name is most permanently connected with the great case of Stockdale v. Hansard, which involved the constitutional question as to whether the House of Commons had the right of publishing its reports without rendering its officers thereby liable to proceedings in the courts of law. On this question Sir Thomas Wilde took the affirmative side, and supported it by a speech of more than three hours' duration, which Dr. Lushington pronounced to be 'the most consummate and learned speech that had been heard in the House.' The matter at issue, as is well known, was eventually compromised by the introduction of a bill by Lord John Russell, formally conferring upon the House that power which it had been claimed in right of Parliament had on the monarchy. The leading speech of Sir Thomas Wilde stood high: he was patient, painstaking, and impartial in the highest degree. As Lord chancellor, his judgments were regarded with respect; and though most of the cases brought before him were appeals from the vice-chancellors' courts, whose decisions were frequently reversed, yet, of his own decisions as a judge only one was reversed on appeal. The chief fault laid to his charge as lord chancellor was an over-anxious and too elaborate dwelling on all the points in an argument, without due regard to their relative importance. Among other important public questions which were decided by him in this capacity was that of the Baptist church-rates. Lord Truro was also eminent as a legal reformer. Whilst holding the office of Lord chancellor he carried through the Commons and Lords a bill which applied the jurisdiction, pleading, and practice of the court, the result of which was that a bill was introduced and carried for the abolition of the twelve masterships, a step which reduced the annual fees of the court by 20,000l. By another and almost permanently-legislative power, some other offices were consolidated or abolished, and the practice of receiving fees by various individuals was suppressed to such an extent that the estimated saving to suitors is 60,000l. a-year. Among the other legal reforms effected by Lord Truro was the appointment of a collector of some of his judicial labours, and so to enable him to give his attention to his duties in the House of Lords, and as a member of the Cabinet without interruption to the law, the office of solicitor to the House, which is connected with the Common Law procedure, the professor object of which is to sweep away the antiquated technicalities upon which
legal decisions were too frequently based, and to insure that they shall henceforth be given according to their own respective merits, "according to the very right and justice of each case" as is more fully explained in Finlayson's "Summary of the Common Law Procedure Act," 1834.

Lord Truro was twice married: his second wife, who survives him, was Madamiselle Augusta Emma d'Este, daughter of H.R.H. the late Duke of Sussex. He died at his residence, Ebenezer Middlesex, on the 11th of November 1838, and was buried by the side of the late Sir Augustus d'Este, in the Old Minster Chapel at Ramsgate.

TRUSTEES. Owing to the inadequacy of the existing law in this respect, and the desire to make provision for the care and management of the property of others, a statute was passed in 1857 (20 & 21 Vict. c. 54) whereby the following obligations were made a misdemeanour punishable with penal servitude for three years, or imprisonment, not exceeding two years, with or without hard labour:

1. The appropriation or disposal, with intent to defraud, by a trustee of any property held for the benefit of some other person, or for any public or charitable purpose.

2. A banker, merchant, broker, attorney, or agent, selling, pledging, or in any manner appropriating, with intent to defraud, the property of any other person intrusted to him for safe custody.

3. The appointment of a power of attorney for the sale or transfer of any property, fraudulently selling or transferring it.

4. A director, member, or public officer of any body corporate or public company, fraudulently taking or applying, for any purpose, money may be claimed for its use.

5. Any director, public officer, or manager of any body corporate or public company, receiving or possessing himself of any of its money or other property, otherwise than in payment of a just debt or demand, and with intent to defraud, omitting to make any entry, to carry, or to direct to be made a full and true entry thereof in the books and accounts of such body corporate or public company.

6. Any director, manager, public officer, or member of any company, by any act of which it is known or believed, for the purpose of defrauding, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

7. Any director, manager, public officer, or member of any company, by any act of which it is known or believed, for the purpose of defrauding, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

8. Any director, manager, public officer, or member of any company, by any act of which it is known or believed, for the purpose of defrauding, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

9. Any director, manager, public officer, or member of any company, by any act of which it is known or believed, for the purpose of defrauding, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

10. Any director, manager, public officer, or member of any company, by any act of which it is known or believed, for the purpose of defrauding, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

TRUSTS, CHARITABLE. The sovren, as parents patriae, has the general superintendence of all charities; which he exercises by the keeper of his conscience, the Chancellor; and, therefore, whenever it is necessary, the Attorney-General files ex officio an information in the Court of Chancery to have the charity properly established.

Until the passing of Sir Samuel Romilly's Act, in 1812, this was the only ordinary mode of redressing a breach of trust, and, thereon, the General's Act (52 Geo. III. c. 101) was passed, to provide a more summary and efficient remedy for such breaches of trust. For this purpose any two or more persons were enabled, with the permission of the Attorney or Solicitor-General, to bring an information in Chancery praying such relief as the nature of the law might require; and it was directed that such petition should be heard in a summary way upon affidavit, or such other evidence as should be procted, the order thus made to be final, unless appealed against to the House of Lords within two years. This Act led to the appointment of Commissioners, who were to report upon cases of neglect, abuse, or breach of trust; and the reports of this body, which now extend to 36 volumes, form a valuable collection of information on the subject of existing charities. Additional powers were given by the statute 3 & 4 Vict. c. 77 to the Court of Chancery with respect to grammar schools, but the latest and most important piece of legislation on this subject is 'The Charitable Trusts and Private Laws Acts, 1887, 1888.' The Charity Commissioners for England and Wales, who are to inquire into all or any charities, their nature, objects, and administration, and the condition of the estates and funds belonging to them. This board is empowered to require all trustees of charities to render in writing to the board or its inspectors, accounts, explanations, and answers, to any inquiries, and to produce any documents in their custody.

When the income of any charity exceeds 30l., and in the case of a London charity even when the income is below that sum, the Master of the Rolls and the Vice-Chancellor are to entertain any suit which may be brought for its administration. In the administration of charities where the income does not exceed 30l., jurisdiction is given to the county court in cases of bankruptcy and to the county court or district court in cases where the charity is situated. The decision of any district court of bankruptcy or county court may, however, be brought by the commissioners before a judge of the Court of Chancery, for re-consideration. [COUNTY COURTS, S. 2.] Application may be made to the Attorney-General, by any one or more of the trustees or managers of the charity, by any one interested in it, or by any two or more inhabitants of the place where it is administered; and the courts are to proceed from entertaining any legal proceedings (except ex officio proceedings of the Attorney-General) unless upon the certificate of the board, the first proceeding is, in almost all cases, to communicate with that board and obtain its sanction and advice. The powers of the Charity Commissioners by the Act of 1882 are made of extraneous information on the board of charities, enable it to afford the most efficient assistance to individual informants. The statute does not extend to Scotland or Ireland; and from its operation are excepted the Universities of Oxford and Cambridge, and certain other institutions. A report of the proceedings of the Attorney Commissioners must be annually laid before Parliament. (Blackst. 'Comm.,' Mr. Kerr's edition, v. ill., p. 483.)

TRYPHILINE [MINERALOGY, S. 1.] TRYUMMUS. TURKISH. The Turkish Empire is divided into Eylaths or general governments, each administered by a pasha, who is generally styled Veli, or vice-roy. The Eylaths are divided into Livas, governed by Kaimakans, or lieutenant-governors. The pashas are subdivided into districts, and these again into Nahiges, or communes, containing villages and hamlets.

Turkey in Europe contains 15 Eylaths, divided into 43 Livas, and 376 Casas. Turkey in Asia is divided into 18 Eylaths, 78 Livas, and 86 Casas; Turkey in Africa into 3 Eylaths, 17 Livas, and 86 Casas. The following table gives the names of the Eylaths, with the chief town of each, extracted from M. Uboini's recent work upon Turkey:
A general estimate of the population in 1844 made the inhabitants amount in round numbers to 35,560,000, distributed as follows among the great popular divisions of the empire:

</table>

The total area of the Ottoman empire, including the tributary provinces, is estimated at 1,220,000 square miles, of which about 300,000 are in Europe, 560,000 in Asia, and 360,000 are in Africa.

With regard to the administrative division of the empire it must be observed that neither the cylists nor the sanjaks, or lives, have such invariable limits as provinces in Europe usually have: and regard to the population, it is obvious that, deducting the powers kept over the tributary but almost independent states of Servia, Moldavia, Wallachia, Egypt, Tripoli, and Tunis, the inhabitants subject to the Porte do not much exceed 26 millions.

Abdul Medjid, son of Mahmud II, ascended the throne of Osman in 1839, in his 16th year. The loss of the battle of Nezib, the treachery of the Cepadan pasha, who deserted to Mehemet Ali with the whole of the Turkish fleet, and the advance of the victorious Ibrahim, seemed to foreshadow the immediate dissolution of the Turkish empire. This disaster was prevented however by the treaty of London (July 15, 1840), in fulfilment of which an Austrian-English fleet bombarded and took Acre, Sidon, and several other towns on the coast of Syria, which Ibrahim Pasha was obliged to evacuate. Negotiations for peace soon followed, which terminated in the restoration of Syria to the Porte, and the recognition of Mehemet Ali as hereditary pasha of Egypt and its dependencies, upon payment of an annual tribute.

On the death of Mahmud II., the old Turkish party, opposed to all innovations, and especially to all imitations of the polity of Christian states, hoped that no more would be heard of reform. But their hopes were blasted by the appearance of the Hattishef of Galhacid, dated Nov. 3, 1839, and countersigned by Resheid Pasha, which contained guarantees for the life, property, and honour of all the subjects of the Sultan, irrespective of person or religion, and which reformed the system of recruiting, and the introduction of an impartial system of taxation. The issue of this charter threw the empire into commotion; the old Turks, headed by Risa Pasha in the capital (who was accused of being under the influence of Russia), made a formidable opposition to the execution of the decree; the Turkish subjects of the Sultan, brought up in principles of ascendancy and contempt for Christianity, rose in insurrection to defend their privileges. To this class of the subjects of the Sultan in that part of the empire, long groaning under oppression, were accustomeds and taught to look to protection and deliverance to Russia. France had to interpose frequently (but more or less covertly) to protect the Hattishef of Galhacid, and to prevent the fall of the Porte; and the English and Austrian ambassadors at the Sublime Porte embraced every opportunity of keeping up the influence of their several governments. Thus, not only did the foreign nations interfere in the domestic affairs of the empire, but their ambassadors seemed to be set of players with Turkey for a chessboard. The execution and firm establishment of the system mooted by the Hattishef, would have put an end to this state of things. The Christian subjects of the Porte, who were suffering from the protection of law, and depriving them of all excuse and desire for seeking foreign protection. Russia could never coax a people to take shelter behind her shield who lived secure under theegis of law. The Sultan’s government, it is true, has given many indications of persevering reform, and has issued many orders in furtherance of the system (among others one in 1855 for the reception of Christian evidence in the courts of justice), but the fact is undeniable, that the central government is not able to cope in the present state of things with the demand of the Christian population of the empire. A fine instance of the noble generosity that lies at the bottom of the Turkish character was exhibited to the world in the refusal of the Sultan Abdu-l-Medjid to surrender his subject Maximilian for execution to the imperial sovereign of France and Russia in 1849. Nevertheless the influence of Russia, however it might diminish at court, was rapidly extending among the Christian population of the empire. Indeed, for the mere terms of the treaties of Kainari, Adrianopole, Unkerm-Sokolow, it is clear that the Porte has driven the nose of political dependence closer and tighter near the neck of Turkey. The crisis seemed to arrive, when 1853 the Czar Nicholas, through his minister Menszik 2 diverted opened the protectorate of the Porte over the Obero of the Sultan, threw the right to adjudicate in certain cases of dispute; and insolently occupied Moldavia and Wallachia, as a ‘martial guarantee’ for compliance with his demands. In consequence of this, a Turkish war was under Omar Pasha occupied the Balkan and the fortress of the Danube; and French and English fleets cast anchor in Besika Bay. In October following the Porte declared war against Russia, and appealed to France and England for aid. In the campaign that followed in Little Wallachia and Unkerm-Sokolow, the Porte was completely defeated, but in November the Russian fleet, issuing from the harbour of Sevastopol, attacked and utterly destroyed the Turkish fleet in the roads of Sinope. In the following March the Porte was compelled to evacuate the Dobrudja; and about the same time England and France declared war, and the fleets entered the Black Sea. On the 15th of June the Russians, after great efforts and vast loss of men, raised the siege of Sinopia (French and English armies now appearing in Turkey, encompassed the army of Varna), and retreated across the Danube. The Turks crossed the Danube. The Russians were defeated at Giurgevo, and soon after evacuated the principality which, in accordance with the terms of a treaty with the Porte, were occupied by Austrian forces. Meanwhile the French and English fleets entered the Black Sea, bombarded Odessa, and forced the Russian fleet to take refuge in the harbour of Sevastopol. An Anglo-French army landed on September 14, 1854, under the command of Marshal St. Arnaud and Lord Raglan. The battle of Alma followed on the 20th, in which the Russians under Prince Menszikoff were utterly defeated by the allies, the road was open to Sevastopol. To secure ready occupation of the city, another army was sent by a flank march, seized upon the harbours of Balaklava and Kamiesch, and the southern side of Sevastopol was invested on the 26th of September, the Russians having, in 3 days, by sinking several warships, barricaded the entrance by sea to this great town, and military arsenal. Here, on the dreary heights of Sevastopol, throughout the terrible winter of 1854–5, allies maintained the hard struggle and obstinate the Turks, with a skilful force within and a considerable body without, humbling the name and prestige of Russia by
victories of Inkerman and Balaklava; and kept the eyes of the world fixed upon the spot where the whole interest of the war was now concentrated throughout the entire spring and summer of 1855, electric agency flashing to all parts of Europe tidings of losses and sufferings often, of defeat never, and of victory more than he had expected, least of all which was the victory of Tchernaya, August 16, in which the Sardinians, then numbered among the allies, fought with great skill and courage; until at last, after a long bombardment, the Malakoff fortress on the 8th of S.t-George, and the allied fleet took Scutari.

TURNER, JOSEPH MALLOLD WILLIAM, was born on Nov. 26, Maidue-lane, Covent Garden, where his father carried on business as a hair dresser. The year, as well as the name of his father, is given in the name of two of his pictures, and that is certainly known respecting either is, that his baptism is entered on the register of the parish church of St. Paul's, Covent Garden, as having taken place on the 14th of May, 1775; and it is most probable that his baptism followed pretty close upon his birth. Of his boyhood and youth little is told. His father, a tradesman in a small way, did not attempt to make his son a scholar, and the great painter never advanced far beyond the rudiments of an ordinary English education. His first real education was his primary training in art, or what led him to think of painting, and it was that which gave him the precise information. Probably his own strong inclination first stimulated him to overcome the initiatory difficulties of the study of drawing, and some casual occurrence or accident occasioned the beginning of his study. There were never any such accidents that appear that the elder Turner thwarted his son's inclination, though, perhaps from poverty, perhaps from indigence, he did not procure him the instruction which might have smoothed his early path.

Turner's self-made painter. It is said in a brief notice of him published in 1805—when, though only in his thirtieth year, he was already recognised as the first of living landscape painters—"Turner may be considered as standing in the same relation to this art as Rembrandt to painting, and Rubens to his; as much may be gained by the advancement of one branch of industry, if accompanied by perseverance, without the assistance of a master. The way he acquired his professional powers was by borrowing when he could a drawing or picture to copy; or by making a sketch of any one in the Exhibition early in the morning, and finishing it up at home. By such practices, and by a patient perseverance, he has overcome all the difficulties of the art." (Davy's "Professional Sketches of Modern Artists," Works, p. 352.)

This passage was written by one eminent in his day as an inducement to Turner to try his fair influence upon the young artist, and to advise him to avail himself of the friend of Girtin, Turner's earliest and closest artistic associate, and it coincides with what other authorities, both written and traditionary, have always related of his career. But from the year 1789 to 1798 when he opened to him the means of obtaining professional knowledge, he having been admitted as a student in the Royal Academy in 1789, when consequently he was only fourteen years old. It is hardly probable, however, that he received much direct instruction in the Academy schools, or that he followed their prescribed course. If he studied in the antique, or later in the life-school, he certainly never acquired mastery over the human form, and no instruction was given the student in landscape drawing or painting. Still it is not like that a young artist such as he certainly was, would attend the schools and form acquaintance with professors and students, without acquiring from them much technical information, even if he received no systematic instruction. But at the earliest furthest he obtained from those masterpieces of art—fields and Dr. Monro's work—Dr. Monro, who was a warm-hearted patron of young artists, had an excellent collection of water-colour drawings and engravings at his residence in the Adelphi, and he not only gave his two favourite proteges, Girtin and Turner, free access to these treasures, with permission to copy them, but directed their studies, and encouraged them to make coloured sketches of the scenery around London, which he readily purchased at prices from twelve to twenty guineas. In these sketching rambles, Turner and Girtin wandered together, and they formed for themselves a style of water-colour painting very different from that of any of their predecessors—unless indeed it be Cozens, a man of some genius and a good colourist, who in his time is said to have painted not less than two thousand pictures, "the possession much was probably learned by the two young painters. Girtin was Turner's senior by a year or two, and as he was the more regularly educated artist, it is not unlikely that he was to some extent his companion's tutor; certain it is that their drawings were very similar in style—the chief difference being that Turner made out his details more carefully—and some have fancied that had Girtin lived he would have been as great a painter as his friend. He gave the same day that Turner had been born, and was consequently thirty-four years older than him, and had passed at the early age of twenty-seven. Turner, with more self-control and perseverance, laboured steadily on, and rose in good time to the undisputed supremacy in his branch of art.

Two years before he entered the academy as a student, in 1787, when only twelve years of age (supposing his baptismal year was the year of his birth), Turner made his bow to the public as an exhibitor at the Royal Academy (under the name of "J. W. Turner") with his pictures "A Sunset on the Thames," and "Wanstead House:" his next appearance being in 1790, the year following his admission as a student, when he sent a "View of the Archbishop's Palace, Lambeth."

From this time till his death—a period of sixty-years—he regularly contributed to every exhibition of the Royal Academy, with the exception of the years 1821, 1824, and 1849, sending in all 259 pictures, a very large proportion of them being paintings of considerable magnitude. But these alone are not the works which give a very inadequate notion of his remarkable facility in art as a painter of small pictures. He also sent to the British Institution some twenty oil paintings which had not been exhibited at the Academy, and painted a large number, and some of them his chief works, which remained unsold at all, besides the hundreds of water-colour drawings and designs for engraving.

For some ten or twelve years he painted chiefly, if not exclusively, in water-colours, his pictures—with the exception of two or three fancy subjects, such as "The Battle of the Nile," and "The Fifth of November," 1805, being confined to the representation of English and Welsh scenery. But already it was felt that there was a degree of brilliancy of execution united with close observation of nature which was none of the qualities of any of his contemporaries, and justified the highest anticipations of his future success. The popular opinion received professional confirmation by his election in 1799 as an associate of the Royal Academy; in 1802 he became an academician. He now visited Scotland, France, Switzerland, and the Rhine; launched boldly into oil painting on canvases of large size, and began to look into the Greek and Roman poets—or their substitute Lemperrie—for subjects for his pencil. This year, 1802, the exhibition afforded many fine specimens of vivid colour, and high finish. Turner was taking his contributions being "The Falls of the Clyde;" "Kilsburn Castle;" "Edinburgh from the Water of Leith;" "Ben Lomond Mountains—the Traveler;" "The Housetoun;" "The Storm;" "A Shieling Man in a Sea-Shore in Squally Weather;" and "Ships bearing up for Anchorage." He evidently felt his strength; yet year after year, while showing himself sufficiently conscious that he knew his proper walk, he kept on putting forth strange experiments in subjects and methods: thus one year (1803) saw his "Holy Family," another (1807) "A Country Blacksmith disputing upon the price charged to the Butcher for shoeing his Pony," another (1808) "The Unpaid Bill, or the Dentist reproving his Son's Prodigality, and another (1809) "The Garrick's Petticoat" but even from these strange whims he seemed to gather new strength. At this time however he appears to have studied with most earnestness the stormy ocean, and never yet has the sea in its most agitated and most picturesque aspects been more the subject of artists. He delighted in the poetical treatment of views of places, such as his "Edinburgh from Calton Hill," 1804; "Fall of the Rhine at Schaffhausen," 1808, and "Sun Rising through Vapour," 1806, not only enabling him to paint his pictures to great advantage, but perhaps even to wider popularity, while with the connoisseurs his "Narcissus and Echo," 1814, "Mercury and Herse," and "Apollo and Python," 1811, his "Dido and Aeneas," "Apollo, and a long list of other subjects, all6h as his first views of the noble and mighty and grand in his noble "Shipwreck: Fishing-boats endeavouring to rescue the Crew," now at Marlborough house; the "Gale at Sea," belonging to the Earl of Eglcumere; and the "Wreck of the Minotaur," the property of Lord Yarborough. But even alongside of these he continued to paint his "Sunset" themes, and was made a baronet in 1809 for his services in the navy, and in 1811 admitted to the Society of Young Artists. These were the years of his greatest triumphs, and although his pictures have not at all times been the same, yet they are the works which are most generally admired, and which have given him so much fame. As a water-colour painter, he was equal to very few of the French or English artists; and as a painter of marine subjects, he has been unfailing in his excellence. He has shewn a vivid fancy, a great and prodigious fertility of invention, a strong love for the picturesque, an accurate observation of nature, a indefatigable perseverance, and a great taste for invention and composition.
purely imaginative productions of this period, 'snow-storm—
Hannibal crossing the Alps,' and the like, in which he
almost for the first time portrayed with some approach
to the vastness and sublimity of nature the fierce encounter
of the elements, the splendour of the rarer phenomena of
the atmosphere, and the beauty and glory of the moun-
tains.
In 1807 Turner was elected professor in perspective to
the Royal Academy, and for several years he continued to
give courses of lectures to the students, an honour in which he
took pride. The landscape schools of the past were not
entirely abandoned by the great landscape painters of earlier
times, of their principles of effect and of colour, and compared them though sparingly
with the teaching of nature; but the lectures were never
printed and no copy of them is left. Report has always spoken of them however as ill-arranged
and ill-delivered, confused in style, and obscure in illustrate.
They never succeeded in securing the attention of the
students, and for many years before he resigned his
professorship he had ceased to deliver any lectures.
An important circumstance in the earlier career of Turner
was the publication of his 'Liber Studiorum,' which was
commenced in 1808. This now famous work was under-
taken in rivalry of the book of sketches known as the
'Liber Veritatis' of Claude, in the possession of the Duke of
Devonshire, of which a series of fac-simile aqua-tinta
engravings was made by Earlom and others. Turner's
series, engraved in a similar style, some of them by Turner
himself, is regarded as the principal example of the principal
forms of landscape composition, and displayed a fertility of resource and an intimate observance of nature such as
the publication of no previous landscape painter had approached. Turner had been long extremely rare, and when brought to sale comprised a high
completeness. Two republishations of it have been announced.
From this time to his death Turner remained the most in
request with publishers and engravers of any English land-
scape-painter, both for the landscape illustrations of books and for series of engravings; and even where his 'econ-
tricities of colour,' as they are called, repel, his engraved designs are few with exceptions received with unmitigated
delight. Among the most famous of these engraved works may be mentioned the 'Scenery of the southern Coast
of England and Wales,' 'Rivers of England,' 'Rivers of
France,' Rogers's 'Italy' and 'Poems,' of all his vignette
engravings the most exquisite, the poems of Byron, Scott,
&c. From his paintings likewise some very notable line-
engravings of large size have been made by Fye, Willmore,
Miller, Prior, &c., while Turner's grand engraving of 'The
Shipwreck' is one of the richest specimens of mezzotinto.
It can hardly be a stretch like this trace the progress of the
painter by the truly impertinent dogmatic record of his life—the production of his chief pictures. He made three
visits to Italy in 1819, 1829, and 1840, and after each his style underwent a remarkable change. The usual division
of his life into three periods is therefore applicable to him. It does not however exactly coincide with his Italian visits. Tur-
ner's career, it is said, comprises three distinct periods; the first reaches to about his twenty-seventh year, when he was
elected to the Academy, and during which he was chiefly
notable as a water-colour painter diligently occupied in
drawing from nature, and at the same time forming for himself a style, by carefully studying (and imitating) the
methods of his English predecessors, Wilson, Louthiersburg,
and others. The second, or period thorough-going, works is very apparent in his earliest oil-paintings: the second
period ranges from 1802 to 1830, in which he is seen first a follower of Claude, and, in a less degree, of
Gaspar Poussin, but rapidly disowning himself from the
trammels of every kind of pupilage to great names, and
striking out a style of landscape-painting entirely
original and wholly unrivalled for brilliancy of colouring
and effect: while the third period, dating from his second
visit to Italy and his return in which he, with the
opportunity, sacrificed in the effort to attain the utmost splendour of
light and colour—to make in (the strange language of his
own 'MS. Falacies of Hope')

' the air
Exhale earth's humid bubbles, and, emulsion of light,
Reflect her forms in each prismatic guise.'

But while such a division is convenient it must not be re-
garded as anything more. Like every great artist, his
conceptions were always advancing and expanding, and in
each period were painted pictures that would seem justly
belong to another. At which period he painted best it is
difficult to say, and judges of art pronounce widely different
opinions. It is quite certain that up to some ten or twelve
years before his death, his knowledge of the phenomena of
the atmosphere, and his perception of the resources of
his art, were rapidly expanding, even when his hand failed to express faithfully his intentions, or his impatience prevented him setting
forth with due elaboration. Any one who has carefully
studied Turner's works, especially in the last time, will
find that, at the same time diligently studied nature, will sympathise if he
cannot entirely concur in the strong statement of Turner's
most ardent admirer, Ruskin:—"There has been marked
and constant progress in his mind; he has not been, like
some other artists, a man who worked by instinct alone;
what he has been as evidently as it has been swiftly progressive,
and in different stages of the struggle, sometimes one ordre of
time, sometimes another, has been aimed at or omitted.

As he advanced, the previous knowledge or
attainment was absorbed in what succeeded, or abandoned
only if incompatible, and never abandoned without a gain;
and his latest works present the sum and perfection of his
accumulated knowledge, delivered with the impatience
and passion of one who feels too much and knows too much,
and has too little time to say it in, in pause for expression, or
pander over his syllables." ('Modern Painters,' i. 407.)

It would be easy to refer to examples illustrative of
Turner's different periods, but so large a number of his
pictures is now possessed by rich private collectors, by
museums, and by the public, that particular examples of
his works, with the exception of a few in the artist's private
collection, and of the other examples of Turner's pencil in
the public galleries, will sufficiently illustrate what has
been said of the progressive and, as it were, tentative
character of his mind; and a studious consideration will
convince the visitor to the galleries of additional
unusual phenomena by maltreatment, which has been
for the purpose. Turner in fact seems never to have
understood the limits of his art, and in seeking to accom-
plish what is impracticable with such means as he possessed,
and with such necessarily imperfect skill, he became extra-
vagant and bizarre. Although eccentricity of colour and
indefiniteness of form were at all times charged upon his
paintings, the extreme development of this fault is
chiefly urged against the works executed during the last twenty
years of his life, when he seems to have been incapable of
unfailing suggestiveness, to an artistic eye, in every one of
them, it is upon these works that censure will eventually
rest. Yet it is remarkable that to this period belong some
of his best oils, and that his most perfect landscapes
valued powers as a landscape-painter are seen in their
fullest development, his 'Child's Harold, or Modern Italy,'
(now at Marlborough House) which was painted in 1832;
and to this period also belong some of his most poetic
efforts, including 'The Fighting Temeraire lugged to her
last Berth' (1839), and the 'Slaves throwing overboard
the dead and dying—Typhon coming on' (1840).

Turner died on the 19th of December 1851, in humble
lodgings in Chelsea, of consumption, on the 6th of a
river-side at Chelsea. He was buried with some state
in the crypt of St. Paul's Cathedral by the side of Reynolds,
Wilkie, Fuseli, and others of our eminent painters. Turner
was a man of unsocial and reserved manners, and many
gossiping stories are related of his coarseness and love
of money: but they bear on their face a coloured and ex-
aggerated character. It is certain that he had hoarded
his money for no selfish purpose. For many years he had
lived in poverty, but, with his usual vision, he secured
the best pictures, and when any such, painted and sold in his own name or for sale, he if possible purchased them.
On his death it was found that he had by his will bequeathed to the nation all
the pictures and drawings then collected in his residence,
'the family library and picture gallery.' With a suitable gallery was erected for them within ten
years; and his funded property to found an asylum at Twickenham
for decayed artists. Unfortunately the will was unskilfully
drawn, and a suit in chancery ensued, but it was compo-

Digitized by Google
mixed by the engravings and the other property being transferred to the next of kin, with the dispute of the will, while the paintings and drawings were held by the nation. The oil paintings, 100 hundred in number, include many of his finest works as well as a number of portraits and landscapes painted by Mr. Ruskin, who volunteered his services to the government; and a choice selection of them is now hung on the gallery at Marlborough-House. Among those now exhibited are a number of the drawings, oil and watercolors, and numerous sepia drawings made for the 'Liber Studiorum,' the Rivers, &c., some of which are of an exquisite beauty and brilliancy of effect, probably unequalled among drawings of that character. The nation also possesses in the collections presented by Mr. Vernon and Mr. Stephens several other choice examples of Turner's pencil.

There is no need to add anything to what has been said respecting the rank which Turner holds among the landscape painters of either his own or an earlier time. But as his style is not confined to a single subject, it is only fair to acknowledge his superiority—it may be well to quote the calm judgment of a German writer whose authority is admitted, and whose opinion is the result of a repeated consideration of his works. Dr. Wagner says—'The power of Turner is, of course, the result of a rare combination of qualities, a power to show things and not mere names; to place them in their relations with one another, to estheticize, to harmonize; a power that seems to result only from a profound penetration into the nature of things. He has a gift for place and for time, that is the secret of his success.'

His local descriptions exhibit the most exquisite feeling for beauty of lines and effect of lighting: at the same time he has the power of making the figures fit in properly; his art is not confined to the picturesque, but is as applicable to the actual as to the ideal, and the result is that his reputation rests only on his work, and he had his leisure by studious reading and composition. While in business for himself he began to collect materials for his 'History of the Anglo-Saxons,' of which the first volume was published in 1848. This work, which has been in progress for a number of years, is on this work that his reputation chiefly rests. He was the first English author who had taken the pains, or had had sufficient knowledge, to investigate the valuable remains left to us in Anglo-Saxon records. He consulted the original manuscripts with great industry and intelligence, and the result has been that, though his views have been more than once assailed, they have generally sustained the test of time. It is a matter of which is more than once believed that the study of Saxon literature has been made more popular and useful by the smaller and more easily understood. The work soon took a permanent place in the historical literature of the country, and, encouraged by his success, he continued his history from the Norman conquest to the death of Elizabeth, published in three separate volumes, the last of which was published in 1854. This work, as presented in the 'Archaeological Journal' published between 1848 and 1851, formed the groundwork of his fame. The project for a valuable introduction; the work being presented to the Roxburgh Club by Mr. Beriah Bottfield. After the publication of this volume he was made secretary to the Society of Antiquaries. The advantage of readiness in imparting information respecting antiquities was remarkable; he wrote some valuable papers for the 'Journal' of the Society, and communicated several records to the Society of Antiquaries at Newcastle, which are printed in the 'Archaeologia Xlissiana.' On his retirement from this office, he continued his studies, but commenced his work, 'Some Account of Domestic Architecture in England, from the Saxon period to the end of the Thirteenth Century,' which was published in 1855.

This work, and his papers in the 'Archaeological Journal' of 1848 and 1851, formed the groundwork of this leader. The porphyry was made a scarce and expensive commodity, and it is necessary to the student of English antiquities. It does not confine itself to the study of the material remains, but includes the story of the people, their customs, their manners, and their institutions. The study of the material remains, the history of the people, and the customs of the times are all necessary to a complete and accurate knowledge of the subject.
great accomplishments could have been wished and might have been expected. His vast store of knowledge was freely scattered in conversation; he had constant applications for information, and few were sent away unsatisfied; but his ardour for accumulation prevented his application to composition, so that of his many projected works the one above-named was the only one executed, and that in a manner but a fragment: at any rate, Mr. Turner promised to carry on the subject to a more recent period, a promise he did not live to fulfil. A second volume has however been prepared and published by Mr. Parker of Oxford.

TURTONIA, a genus of Conchiferous Molusca, named by Mr. Hanley after Dr. Turton. There is but one species, T. minute, which has been separated from the genus Kellia. The shell is oblong, inequilateral, anterior side very short, ligament concealed between the valves; hinge-teeth 2-2. Animal with the mantle open in front; foot large, keeled; siphon, single, slender, elongated, protruded from the long end of the shell. It is found in Great Britain; also in Norway and Greenland. (Forbes and Hanley, British Molusca.)

TUSCANY. The territory of Lunca fell to Tuscany in 1847.

LUCCA.] The Grand-Duchy is divided into compartments, or provinces, as in the following table:

TWICKENHAM. [Middlesex.]

TYPHOUS FEVER. [Physic, Prat. 1848, p. 22.]

TYTLER, PATRICK FRASER, was born at Edinburgh on the 30th of August, 1791, the fourth son of Alexander Fraser Tytler, Lord Woodhouselee. He was destined to increase the literary reputation of a family in which literary taste and talent seemed hereditary. After having been educated at the High School and the University of Edinburgh, he became a member of the Scotch Faculty of Advocates in 1813, but he soon abandoned practice for authorship. On the peace of 1814 he accompanied Mr. (now Sir Archibald) Alison and the present Lord-Justices Clerk of Scotland on a visit to the Continent. His first literary efforts were as contributor to 'Blackwood's Magazine,' but in 1819 was published in Edinburgh an independent work entitled 'Life of James Crichton of Cluny, commonly called Admirable Crichton.' The work reached a second edition in 1823, when an 'Appendix of Original Papers' was added to it. In 1825 he published an edition of the Works of Sir Thomas Craig of Riccarton; including biographical sketches of the most eminent legal characters from the institution of the Court of Session by James V. till the period of the Union of the Crowns; and this was followed in 1828 by a 'Life of John Winckely,' published anonymously. It was about this time that, on the earnest suggestion of Sir Walter Scott, who had at one time thought, of undertaking the task himself, he began his great work, 'The History of Scotland.' The first volume was published in 1829, and the work was completed in nine volumes in 1843. It has since then passed through several editions, and is recognised everywhere as the standard History of Scotland—the only work in which Scotch history is treated at full length on the basis of authentic materials, and in a calm and accurate as distinct from a merely popular manner. It commences with the accession of Alexander III. to the Scotch throne in the 13th century, and brings down the narrative to the Union of the two countries. From the union of the two countries he set out on the work; during this writing, Mr. Tytler resided sometimes in Edinburgh, sometimes in London, collecting materials in both places. During the time that the work was in progress he threw off other smaller historical works, of which the following is a list:—'Lives of Scottish Worthies,' in 2 vols., 1831-33; 'Historical View of the Progress of Discovery on the more Northern Coasts of America,' published in Edinburgh in 1832, and recently re-edited in America; 'Life of Sir Walter Raleigh,' 1835; 'Life of Henry the Eighth,' 1837, and 'Life of Oliver and Lord Hertford.' Mr. Tytler and Mary, illustrated in a series of original letters, with historical introductions and notes, 1839.

MR. TYTLER also wrote the article 'Scotland' for the seventh edition of the Encyclopedia Britannica, and this work has since been re-published as a useful abridgment. In recognition of claims so well founded, Sir Robert Peel's government conferred on Mr. Tytler a pension of 600l. a year. In politics he was a Conservative. Though an Episcopalian, he took much interest in the Scottish Presbyterian movement of 1834-43. In private life he was much beloved for his social qualities. Towards the close of his life he suffered much from ill-health, and went abroad for a time. He returned to Edinburgh, and died on the 24th of December 1849. He was twice married, and left two sons and a daughter by his first wife.

UDORA, a genus of Plants belonging to the natural order Hydrocharidaceae. A probable species of this genus has been recently introduced into England, and described by Babington under the name of Anacharis alismaturn. The following is his description in the 'Manual of British Botany':—

it has its leaves 3 in a wheel, oval-oblong, obtuse, serrulate (the male flower unknown), the female flower with a tubular bisid spathe, many times longer than the sessile germen: sepals, and petals, broad, nearly equal; stigmas reflexed. The stem is long, branching; whorls of leaves many and close together. Flowers subtended by a leaf-like bract. Flowers: no petals, and no seeds. The sepals tinged with green and pink externally, hooded, with a narrow diaphanous margin. The petals are flat, diaphanous, recurved, and oblong. Filaments at first curved outward, their points placed under the hood of the sepals, afterwards erect, linear, blunt, diaphanous; stigmas recurved, linear, or deeply bisid; sepals, petals, and stigmas, of about equal length; the style adnate on three sides to the tube.

This plant was first observed in Great Britain by the late Dr. Johnson of Berwick-upon-Tweed, in the river Whiteadder, in Berwickshire. It was afterwards discovered in a canal near Nottingham, and subsequently in many other places. Although at first not known, yet late inquiries have led to the conclusion that this plant is the Udora Cambdensis of American botanists, and that it has been introduced into this country by means of the timber that is brought from the New World. Its power of retaining its vitality adapts it to bear so long a journey without destruction. The pelt-tilliferous plants have alone been seen in Great Britain. Its power however of reproducing itself by buds is so great that it has already become a serious pest in the rivers, canals, lakes, and ponds, to which it has had access.

Anacharis alismaturn is one of those plants in which a circulation can be seen, and has afforded to several observers the means of more closely watching these vegetable movements than any other plant which has yet been observed. It has been inferred by Dr. Brasen and others, that the movements of the cell-contents of this plant are produced by cilia. Mr. Weham however regards this movement as originating in the molecular activity of the protoplasm itself

ULSTER, NEW. [Isle of Man, New, S. 2.]

UMPILY. [Arbitration, S. 2.]

UNITED STATES OF NORTH AMERICA, a Republic, formed by the federal union of States and Territories.
It occupies the middle portion of North America; and extends between 26° and 49° N. lat., 67° and 122° W. long.; from the Atlantic Ocean on the east to the Pacific Ocean on the west. It is bounded N. by British America, S. W. by the republic of Mexico, and S. by the Gulf of Mexico. The boundary line between the United States and British America is stated under Ursula was 81,360 square miles. The greatest width of the United States from east to west is 2900 miles, the greatest length from north to south is 3730 miles. The entire area of the United States has been very differently estimated. As estimated by the United States authorities for the Census office in 1850, it amounted to 2,906,800 square miles. But a more elaborate and careful estimate made by the United States Topographical Bureau, January 1854, reduces the area to 2,836,186 square miles, and if to this be added the additional territory of 27,600 square miles, ceded by Mexico by treaty in July 1854, the total area at the present time will be 2,963,666 square miles. The population in 1850 was 22,191,576, and 7,800 to a square mile: but this does not include the native Indians, who were estimated by the Indian Commissioner in 1853 at 400,764. The following table shows the States and Territories comprised in the United States, with the extent of each, the number and character of its population in 1850, and other particulars.

The areas of several of the States and Territories in this table are given from the new computations made by the United States Topographical Bureau, and recently made public in the 'Statistical View of the United States,' drawn up and printed by order of Congress.

The physical geography of the United States has been given generally under America; and more particularly under the heads of the several States and Territories; of the rivers, Columbia; Mississippi; Missouri, &c.; the Alleghany, and Rocky Mountains, &c.; and the lakes Erie & Ontario, &c. The total area of the United States, as already stated according to the revised calculations of Colonist Abert, of the United States Topographical Engineers, is 2,906,800 square miles, which he thus apporitions:—Area of the Pacific slope, or of the region watered by rivers falling into the Pacific, 793,702 square miles; the Mississippi Valley, 1,217,602 square miles; and the region whose waters fall into the Atlantic, 955,496 square miles. The number of inhabitants in 1850 was 22,191,576, and 7,800 to a square mile.

The following table taken, with a few slight changes to render it more readily understood by English readers, from the official 'Compendium to the Census,' will show at a glance the extent of the territorial acquisitions, and the occasions on which they were made:—

Additional, ceded by Mexico by a new treaty, 1854 |

Total | 2,963,666 |

The total area of the United States at the peace of 1815 was 819,579 square miles. The purchase of Louisiana from France in 1803 was 1810 square miles. The creation of Florida by Spain in 1819 was 1819 square miles. The admission of Texas [see Texas] in 1844 was 318,000 square miles. The territory obtained by Oregon treaty with Great Britain in 1846 was 368,062 square miles. The territory ceded by Mexico [see Mexico] in 1848 was 592,955 square miles. The additional, ceded by Mexico by a new treaty, in 1854 was 27,500 square miles. The total area of the United States is 2,963,666 square miles.
The following table shows the rate of increase of the various classes of the population at the several censuses of the Union, except the census of 1840, which is given under United States.

The commerce of the United States has gone on rapidly extending, until next to that of Great Britain it is the largest in the world. During the year June 30, 1866, the total imports of the United States amounted to 314,629,942 dollars; the exports to 326,964,908 dollars; of which 310,686,330 dollars were of domestic produce, and 16,578,672 dollars of foreign produce. Of the foreign trade, considerably more than half is with Great Britain and its dependencies. The total amount of tonnage engaged in the foreign trade was 4,671,662. The total number of American vessels entered from foreign countries in 1866 was 10,507, of foreign vessels, 11,176; the clearance of vessels during the same year was on American vessels 10,092, of foreign vessels 11,186. The registered tonnage of the commercial navy was 2,491,403. The crew of American vessels cleared out numbered 152,797 men and 37,913, and distributed generally under the heads of canals 4738 miles; of railways 24,290 miles completed.

The naval and also the military forces will be found under Military and Naval Forces, S. 2.

The revenue of the United States for the year ending June 30, 1866, amounted to 315,513,961 dollars, of which 63,875,905 dollars were raised by customs duties. The expenditure for the same year was 70,822,724 dollars. Of this 5,943,869 dollars was for interest on and redemption of the public debt, which amounted to 30,263,900 dollars.

A list of the Presidents, continued after those previously given (v. xxvi. p. 12) —

10. John Tyler  1841 to 1845
11. James Knox Polk  1845 1849
12. Zachary Taylor (died in office)  1849 1850
13. Millard Fillmore  1850 1853
14. Franklin Pierce  1853 1857
15. James Buchanan  1857

From the establishment of their position as an independent republic until the present time, the United States have been chiefly occupied in the development of their vast resources. Many of the leading causes of these developments have been foreign relations, which have happened and excited much interest, but it does not belong to us to notice more than will be found in America, S. 2; California, S. 2; Oregon, S. 2; Texas, S. 2; Utah, S. 2.

The motion of the solar system in space is directed towards the planet 1863 radii of the terrestrial orbit, or 154 millions of miles.

The observations which led to this great discovery were all made on stars of the northern hemisphere. It was most probably made by the observations of the stars of the southern hemisphere which would indicate a motion of the solar system towards the same point as that shown by the northern stars. This laborious task was undertaken by M. Leverrier, who published his results in a memoir published in 1844, in which the catalogue of 172 stars observed at Mr. Henderson at the Cape of Good Hope, with the older determinations of Bradley and Lacaille, he arrived at almost exactly the same conclusion as Argelander and Otto Struve; the reality of motion being proved, and the point of motion being nearly identical. For this work Mr. Galloway received the gold medal of the Astronomical Society. Finally, to remove all possibility of doubt, if any remained, Mr. Main contributed to the Astronomical Society, in 1854, a paper in which the motions of 675 stars observed at Greenwich, in which the accuracy of the investigations of Argelander and Struve was fully established.

The fact of this rapid movement of the entire solar system in space and its great importance in astronomy, while in the higher theoretical branch of the science it is of great importance to astronomers on the consideration of the question whether there does not exist a general centre of gravity, to which is subjected not only our own solar system, but the whole of the stars of the Milky Way. The question is difficult but regarded as of consequence, not least as to a certain extent premature, though by no means so discouraged as forrunners of something more decisive.
ledge was fully stated under Scw. Since that article was written, the spots on the sun have been carefully watched by many skilful observers. The observations and investigations of Dr. Bal in, Mr. Dawes, and others, have been particularly valuable. One of the chief points ascertained was that, by Mr. Dawes (in 1859), of the rotation of the sun's spots.

The latest important contribution on this particular subject was that of M. Schwabe of Dussan, which obtained for him the gold medal of the Royal Astronomical Society in 1857. The result of his investigations was thus stated by Dr. Lloyd in his address as president of the British Association, 1857:—"According to the observations of Schwabe, which have been continued without interruption for 20 years, the instantaneous spots on the sun's surface, which are not visible at any instant, increase and decrease periodically, the length of the period being 11 years and 40 days. This remarkable fact and the relation which it appears to have to certain periods of solar activity, add fresh interest to the study of the solar surface; and upon the suggestion of Sir John Herschel, a photobehiographic apparatus has lately been established at Kew for the purpose of depicting the actual molecular state of the sun's surface from time to time."

Of the constitution of the sun itself, little additional knowledge has been acquired. "Towards the close of the last century," observed Dr. Lloyd in the presidential address just quoted, "many hypotheses were advanced regarding the nature and constitution of the sun, all of which are considered as in consistent with the present state of our knowledge of the distance by a luminous envelope. But the only certain fact which has been added to science in this department is the proof given by Arago, that the light of the sun emanated (not reflected) by the telescope, passed through the atmosphere, the light of incandescent solid bodies being polarised by refraction, while the light of the sun, and that emitted by gaseous bodies, is unpolarised."

Next to the sun, the earth's satellite the Moon has, among the heavenly bodies, always engaged the largest share of the attention of man. Observations of the moon's visible surface have from the earliest use of telescopes been diligently prosecuted; and while there has been no falling off of late years among astronomers in seal, there has been a great increase of combinations in resultant light, the instruments they have used have been of a very superior character. Their observations on the moon's surface have recently been directed specially to ascertain whether the old opinion of the existence of lunar seas and a lunar atmosphere was well founded or not. Increased telescope power showed that the supposed ocean beds were full of inequalities, in fact, as described by Professor Phillips, 'the so-called seas, under this more exact scrutiny, appear destitute of water, and the supposed ocean beds are filled in with an indescribable variety of little points and minute craters, or uncoloured long winding ridges of very small elevation'; and though Arago suggested that some of these appearances were not inconsistent with uneven sea-bottoms covered with shallow water, yet the beautiful effects of the moon's surface, visible from great heights, he himself, from these and other optical phenomena, acquired in the belief, now general among astronomers, that water does not exist on the surface of the moon.

The appearance of the moon's surface, when examined through a powerful telescope, has, as is well known, been long represented in very carefully prepared maps, on which all the leading features—mountains, plains, ridges, "rills," and other objects, are indicated by names, which astronomers have agreed to assign them. Such a map will be found under the article Moon. The famous lunar map of Beer and Mädler has carried accuracy and beauty of execution as far as it possibly could be approached; but even these points are surpassed by the comparison of many drawings a surprisingly near approach to it has been made. The most minute and perfect accuracy however is what astronomers always desire in the record of their observations; and hence the beautiful art of photography is an indispensable aid to the delineation of the moon. Mr. Bond, the distinguished American astronomer, was the first who so applied it; but it has since been extensively used in this country. Many difficulties have presented themselves, but by that steady, patient, inventive application which is so characteristic of the astronomer, they have already been to a great extent surmounted. By various ingenious apparatus, including the addition of a clock-work motion to the telescope, and by the employment of extreme magnifications, remarkable beauty have been obtained by Mr. De la Rue and some other gentlemen; and it is probable that the portrait drawn by the Moon herself will to a great degree supersede that of the Moon of Buffon. It has already noticed that the Sun is keeping for the perusal of the astronomer a continuous record of the changeful progress of the spots upon his disc.

We may add, that by the very refined means now in use, photographs and daguerreotypes are now obtained almost as perfect as those of the Universe. Special studies of the spots on the sun, but even of Jupiter and his belts, and of numerous astronomical phenomena of a kind which, from their fugitive nature, could only be lightho described in words or depicted in memory.

With respect to the lunar atmosphere, a negative opinion has likewise been arrived at; though whenever an instrument of increased power, or a stellar phenomenon, appears likely to afford a new or more precise test, it is carefully brought to bear upon the point. The most delicate test is the exact observation by a telescope of high magnifying power of the occultation of a planet. If the moon were enveloped in an atmosphere, there would be some change of form or brightness in the planet, owing to atmospheric absorption or reflection at the various points of immersion, or appearance behind the moon, and at its emersion, or reappearance. None such has however been observed with the powerful instruments which have been employed for the last century. On the contrary, the illumination and emersion have been instantaneous without the slightest deflection of the planet's light, and in precise accordance with calculation as to time.

Another question of great interest has also been solved: that of the production of heat by the light of the moon. Various experiments had at different times been made with a view to determining whether the lunar rays gave out any appreciable warmth, but without success. At length, in 1846, Signor Meloni, an eminent Italian astronomer, renewed the experiment on the cone of Mount Vesuvius, and succeeded, by means of a large lens of peculiar construction, in obtaining satisfactory indications of elevation of temperature. Some doubt however remained as to the accuracy of the experiment, but it was destroyed by the most evident evidence of the radiation of heat from the moon being obtained by Professor Piazzi Smyth. To resolve this and some other astronomical, meteorological, and magnetic problems, Mr. Smyth established himself, during the summer of 1856, on the high grounds of Mount Vesuvius, and placed his instruments beyond the obstructing influence of the earth's grosser atmosphere. His upper station was 10,700 feet, his lower 8840 feet, above the level of the sea, and at the lower, as well as at the upper station, the warmth of the moon was distinctly measured.

A point of great interest to astronomers —what is known as the long inequality in the moon's epoch—has been satisfactorily elucidated by the labours of Professor Hansen of Gotha and Mr. Airy, the Astronomer Royal (1846-49); the latter of whom has also discovered and explained a new lunar inequality depending upon the action of the planet Venus. The statement of the reasons of Mssrs. Airy and Hansen would be out of place in a non-mathematical work, but it may be said here that it is considered, as indicative of the importance of these discoveries, (in the words of Mr. Grant, 'History of Physical Astronomy'), that they completely account for the errors in the tables which had long perplexed astronomers and mathematicians of Europe. The lunar theory is thus considered as divested of all serious embarrassment."

"The discoveries, and the corrections of our previous knowledge, in the world of planets, have been equally grand and surprising. In the order of their discovery, and the correspondence of their occurrence, and all that is mainly of interest to the astronomer and the man of science, we may commence with the extraordinary additions made to the group of small planets which revolve in the wide interval between Mars and Jupiter. The discovery of these planets is to be referred to the month of January 1801, so that our knowledge of the entire group belongs to the present century. By March 1807 four had been discovered. The discovery of this fourth minor planet was made by Olbers, the discoverer of the second of the
group, not accidentally, but in the course of a laborious examination of that portion of the heavens, undertaken in the full expectation of finding such a body there. For, on the theory of the nebular planet, its position was conceived and the idea that these two small planets might be fragments of a large planet which had been broken up by some great catastrophe; and if so, that these, and most likely other fragments, were describing round the ecliptic the inclined orbit of which was itself vastly inclined, must fall nearly at the same point. Impressed with this idea, Olbers, after a search prolonged for nearly five years, discovered, as we have said, a fourth planet—a third had been meanwhile discovered accidentally—but the labour of his other astronomer met with a similar reward, and any systematic search was gradually abandoned. Nearly forty years elapsed before a fifth, Astrea, was added to the group of minor planets. A year and a half later another was discovered; and now, after the lapse of little more than ten years, no less than forty-seven more have been found—making in all fifty-three, of which forty-nine have been discovered from the 1st of July 1847—and all (at least all since the fifth of the series) as the result of a systematic exploration made with telescopes of great power.

Without further reference to the hypothesis of Olbers, that these minor planets are the fragments of a disrupted planet, we may notice the remarkable coincidence or conformity of their orbits respecting various other facts. (As quoted by Humboldt in his 'Cosmos,' Sabine's translation, vol. iii, p. 374.) "It appears to testify in favour of a real or inherent connection between all the members of the entire group of the small planets, that, if we figure to ourselves the natural dimensions of their orbits as elliptical material rings, these rings are all so interlinked, that by taking hold of any one, all the others would be lifted by, or found suspended on it." The whole of these minor planets are what are termed telescopic planets, being invisible to the naked eye. The diameter of the largest is indeed probably less than half a mile, but it is scarcely necessary to add, that if the whole 53 at present known—and probably more will yet be found—are fragments of one shattered planet, it must have been very large indeed.

The four minor planets which were first discovered are all noticed under Vesta; but we give a full list of them, arranged in the order in which they were discovered, with the names of the discoverers, and the date of their discovery.

The planet Saturn, from the wonderful appendages connected with it, and the general beauty as well as scientific interest which it presents to the astronomer, always has been an object of careful examination and study; and it might well have been supposed that little additional information was attainable respecting its external character, did not every increase of telescope power afford evidence that the field of astronomical discovery is practically inexhaustible. The first of the recent discoveries was made 1846. During the autumn and winter of that year the rings or rings of Saturn disappeared, and astronomers seized the opportunity to observe the planet with great care in order to obtain more minute and accurate admeasurement, with the view of ascertaining with greater precision the divergence, if any, of his diameter from a true ellipse. In the course of this examination Mr. Bond, of Cambridge, Massachusetts, U.S., observed a bright object situated in the region of an eighth satellite of Saturn—but several a distance from the planet. This satellite, to which the name Hyperion has been given, was first seen by Mr. Bond on the 16th of September, 1846; but its true character was not recognized by him till visited by Mr. Lassell on the 18th of September. The sidereal revolution of this satellite round the planet is 21 days 4 hours, 30 minutes, its mean distance in semi-diameters of Saturn being 6,800. The revolutions and mean distances of its other satellites are given under SATURN.

The other discovery—that of an inner dark, dusky, diaphanous ring, lying between the bright ring and the body of the planet, but unattached to either—was made next two years later. On this occasion Mr. Bond was again one of the first discoverers, but several European astronomers detected it very nearly at the same time; and the actual priority is of less consequence, as it is certain that the inner ring had been observed by Dr. Galle of Berlin in 1848 and described by Encke in the 'Nachrichten' of Mannheim, though somewhat unaccountably it had been suffered to slip entirely out of notice. But the discovery of this inner ring led to a more searching scrutiny of the other rings, and to the detection by our countryman, Mr. Main; and later by Mr. Bond, of a probable division of the external ring. Otto Struve again was led to the conclusion that the inner edge of the interior bright ring is gradually approaching the body of the planet, while the total breadth of both the bright rings is increasing. Mr. Main, however, has set a very large number of admeasurements of the rings with a double-image micrometer, during the years 1859-55, for the purpose of testing Struve's hypothesis, failed to detect any increase of width, and regards Struve as mistaken.

In the article Uranus, that planet was said to have six satellites, but of which only two had been seen, except by the discoverer of Uranus, Sir William Herschel; in 1847-48 two, perhaps three, of these satellites were seen by the Struve, and Mr. Lassell; and in November 1851 Mr. Lassell discovered two new satellites of Uranus, both apparently nearer to the planet than the first satellite of Sir William Herschel: the periods of revolution of the new satellites are respectively 4 days and 5 days, while the first of Herschell's is about 6 days. After what has been said, it is scarcely necessary to add that none of the satellites of Uranus can be seen except with first-rate telescopes. But far more remarkable than either of these discoveries is the discovery of Neptune—as Encke expressed it, in a passage quoted by Humboldt, "the most brilliant of all planetary discoveries, because purely theoretical investigations could be antecedent to the existence of the planet and the new and yet unknown planet. In the matter of the planet Uranus, certain irregularities had been seen for several
years observed, which could not be explained by the action of the planets then known to exist. Several astronomers had directed their attention to this enigma, as Bessel termed it; but no real advance had been made towards solving the problem. The celebrated 19th-century astronomers, Cambridge and Le Verrier of Paris, devoted themselves, unknown to each other, to the task—one of enormous labour, and requiring great skill in the higher mathematics—of arriving by calculation at the source of the perturbation. Each arrived at the conclusion independently and simultaneously that a new planet outside Uranus, and each succeeded in indicating nearly the same position as the spot near which it would be found. The steps in the discovery are so fairly indicated in the following communication by both authors, that we may almost judge, free from national other bias. He says, (Communications,' vol. iii., note 640), "Le Verrier at the instance of Arago, began in the summer of 1845, to work at the theory of Uranus. He laid the results of his investigation before the Institute, on the 10th of November 1845, the 1st of June, 21st of August, and 5th of October, 1846, and published them at once; but his greatest and most important work, which contained the solution of the whole problem, only appeared in the 'Connaissance des Temps for Jan. 1846.' On the 6th of August, 1846, he communicated to M. Cassini, of which he had obtained the perturbing planet, before Professor Challis, in September 1845, and the same, with some modifications, in the following month, October 1845, before the Academia, and Prof. Astronomer Roya—still without publishing anything. The results which Le Verrier derived from his observations with some fresh corrections relating to a diminution of the distance, in the beginning of September 1846. The young Cambridge geometer," continues Humboldt, "has expressed his surprise at the results we have obtained in a subject of this chronological succession of labours, which were all directed to the same great object. I mention these earlier dates merely to show that my results were arrived at independently, and previously to the publication of M. Le Verrier, and not an instance of intention of interfering with his just claims to the honour of the discovery; for there is no doubt that his researches were first published to the world, and led to the actual discovery of the planet by Dr. Galle; as well the facts must always determine in the slightest degree from the credit due to M. Le Verrier." Le Verrier having communicated to Dr. Galle the results at which he had arrived, and begged him to seek for the predicted planet, Galle at once directed the great telescope of the Berlin Observatory to the spot indicated, and, on the 23rd of September 1846, had the exquisite delight—the greatest perhaps which an astronomer could experience—of discovering there the new planet for which he was looking. The name of Neptune has been given to the planet with the full consent of all, and has been calculated with the highest degree of probability, making the total number of periodic comets 27." The mathematical results which are based upon the data of Galle and Le Verrier, and which have been calculated down to December 31, 1853, amounted to 4 periodic comets, and 107 comets the returns of which to the perihelion had not been established with absolute certainty, making altogether 201.

One of the grandest comets mentioned in history is that which made its appearance in the middle of the year 1940. A very brilliant comet which appeared in 1566 is supposed by Mr. Hind to be identical with the former. This comet had been observed by Dr. Galle in 1846, and by Dr. Galle and Dr. Galle in 1853, and by Dr. Galle and Dr. Galle in 1856, and by Dr. Galle and Dr. Galle in 1860, there being an uncertainty of two years in the elements on which the return of the comet is calculated.

In the division of stellar astronomy, beyond the region of the solar system, great activity has been displayed by astronomers. Zones of stars, down to those of the ninth magnitude, double, and multiple, and variable stars, have been with unintermitting labour and perseverance observed and catalogued by Lalande and Lacaille (whose catalogue, and another of great value, have been published by the British Association), Bessel, Argelander, Airy, Lamont, F. G. W. Struve, Chasenac, Rümcker, Cooper, and many more men of profound attainments and indefatigable zeal. The value of star-catalogues has, indeed, hardly been estimated. Of the several star-catalogues which have been published the most important is that of Struve, and indeed the preparation brings to light, it may be sufficient to mention as an illustration, that the great catalogue of Mr. Cooper, made at his observatory, Markree, Ireland, and published by the aid of the philanthropic grant to the Irish Society, is one of the most extensive, and has been published in 1829, and the name of new and the disappearance of old stars, may be mentioned the hypothesis of F. G. W. Struve, that light in its passage through the boundless regions of space becomes invisible, and eventually extinguished—a theory which, if it could be established, would open a wide field for reflection and investigation.

One of the most important recent additions to stellar astronomy is Sir John Herschel's 'Results of Astronomical
Observations made during 1834-36, at the Cape of Good Hope; being the completion of a Telescopic Survey of the Whole Surface of the Visible Heavens, commenced in 1825," which was published in 1847. The first part of this survey was made in the northern hemisphere, as the continuation of his father's work, and the second part was the actual completion of the famous catalogue. Sir John Herschel's four years' residence at the Cape of Good Hope, in the words of Humboldt ('Cosmos,' ii, 303), "constitutes an epoch in respect to the more exact topographical knowledge of the southern heavens," and it is "one of the steps in the history of astronomy," and of the actual data on which the mass of observations made, that it took the author nearly nine years to digest them and prepare the results for publication in a regular form.

Passing to the nebula, we find the greatest advances due to the construction of the magnificently large telescope which Lord Rosse set up on the lawn in front of his residence, Birr Castle, near Parsonstown, in King's County, Ireland. The lenses of this enormous instrument—which has 6 feet aperture and 54 feet focal length, and is by far the largest telescope—have been formed in a telescope instrument constructed under his lordship's personal supervi- sion. As was expected, it was found to possess a far greater amount of space-penetrating power than any previous telescope. By means of it, Lord Rosse has succeeded in seeing many points which had previously eluded the attempt. Besides showing that these hitherto unresolved nebule were wholly composed of stars, Lord Rosse's telescope disclosed many unexpected peculiarities of structure—as, for example, a very remarkable and well defined spiral arrangement in several of the nebule which resisted all its powers of penetr- ation. Some of the so-called nebulous stars have also been shown by it to have a central star-like point placed in a nebulous nucleus, beyond which, but distinct from it, is a nebula extending for many light-years.

It will perhaps be expected that we should allude, but an allusion will be sufficient, to what "in some measure" (borrowing Mr. Airy's words) "belongs to astronomy"—M. Foucault's "experiment on the rotation of the plane of a simple pendulum, in vacuo," and an extension of the work which excited very great attention both in France and England, as visibly proving, if proof were necessary, the rotation of the earth.

We may perhaps not unaptly conclude this sketch by a brief reference to a few of the labours of Mr. Airy at the Royal Observatory, which may indeed almost be regarded as an epitome of recent astronomical progress. Under his ad- ministration the observatory at Greenwich has become second to none in the world. To render the observations made there useful, and to keep them in the very latest list of those that are needed, and new instruments of greatly increased power, and of the most refined character, have been introduced. The yearly observations are published in a form and with a regularness not before attempted. He has also procured the reduction under his own superintendence of the Greenwich Lunar Ob- servations from 1750 to 1830, and the uniform reduction of all the Observations of the Planets made at Greenwich during the same period—works of enormous labour, but of inestimable importance—the former of which was published in two large quarto volumes in 1846, the latter in a very thick quarto volume in 1846. He also introduced and perfected, in a series of elaborate experiments, the method, first practised in America, of determining the longitudes of distant places by means of the telegraph, and the electric telegraph. This by means he successfully determined the longitudes of the principal observatories in the British Islands and on the Continent; and he in like manner connected the observatory with Deal, and with many other maritime and inland stations, so as to mark by the fall of the pendulum with that of the observatory, the true Greenwich mean-time for maritime and other purposes.

We ought also perhaps to notice that, among other good works at the Royal Observatory, 390 M., of which 380 M. was laid before the Academy of Sciences, Paris, his great work entitled 'Reduction des Observations faites aux Instument Méridiens de l'Observatoire de Paris, depuis 1800 jusqu'à 1829,' a work which he had stated that he performed under the authority of any of the staff of officers employed at the observatory.

URANOTANTALITE. [Mineralogy, S. 1.]

URBAN, D. [NATAL, S. R.]
URCHIN. [HEDGEROW.]
URE, ANDREW, M.D., a distinguished chemist, was born at Glasgow in the year 1778. He was educated in the university of his native town, and afterwards studied medi- cine at Edinburgh, and took his degree of M.D. at Glasgow in 1801. In the following year he was appointed professor of chemistry and natural philosophy in the Andersonian Institution in Glasgow. He also gave the lectures on materia medica in connection with the medical courses of this institution, and took his degree of M.D. at Glasgow in 1816. For this purpose visited London, where he made the acquaint- ance of many of the distinguished astronomers and chemists who resided there. He was also appointed astronomer, and lived in the observatory, where he was visited by Sir William Herschel. In the year 1813 he published a 'Systematic Table of the Materia Medica,' with a dissertation on the action of medicines. In 1816 he succeeded the geological and meteorological observations, and has obtained for the author a lasting reputation as a natural philosophe. He subsequently wrote several papers on chemical subjects, all remarkable for the accuracy of the observations and the care with which these papers were prepared, the constitution of muriatic acid, and on the construction of a new eudiometer. In 1821 he published a 'Dictionary of Chemistry,' which was remarkable for the extent and accuracy of its information on all subjects of chemistry, and it was followed by a second edition the following year (1828) he published a paper. On the Ultimate Analysis of Animal and Vegetable Substances, in the 'Philosophical Transactions.' This paper was remarkable as being one of the first to initiate the brilliant period in the study of the composition of organic bodies. It was published in 1824, and was one of the last books on this subject that were published under the influence of the Noachian deluge on the surface of the earth. In 1828, Dr. Ure removed to London, and in 1834 was appointed analytical chemist to the Board of Customs. It was in connection with this important office that he obtained materials for many of his subsequent works. In 1836 he produced a work on the 'Philosophy of Manufactures,' and in 1836, 'The Cotton Manufacture of Great Britain compared with that of other countries.' In 1839 he published a great work, 'On the Arts and Manufactures.' A second edition of this work was published in 1851. His most important works are the composition of the most accurate kind and conveyed in a most lucid style. He was elected a Fellow of the Royal Society of London in 1822, and was one of the original Fellows of the Geological Society, and a Fellow of the Astronomical and other scientific societies both in this country and abroad. He died at his residence in Gower-street, London, on the 2nd of January 1857.

UREDINACRÉ, a family of Fungi, belonging to the sub-order Sordaria. It includes various forms of Fungi, which occur on diseased vegetable tissues, and which are hence called Blights. The spores are single, often partitioned on more or less distinct sporophores, fiosci of the fruit obsolete or mere peduncles. [Fungi.]
USES, CHARITABLE AND SUPERSTITIOUS.

USURY. Although the legitimacy of interest upon moderate and conscientious terms has long been recognised amongst us, has, until quite recently, been believed desirable to make the law the rate at which it should be taken, and interest beyond which no man has ever been stigmatised with the odious appellation of usury. [In-

interest, vol. xii, p. 506.] It has been reserved for our own
time to carry out a principle which political economists hitherto have preached, that no person taking more than the rate of
good interest for the loan of money on any bill or note not
having more than three months to run, should be subject to
any penalty or forfeiture. Shortly afterwards the statute 6
& 7 Will. IV. c. 41, enacted that bills or other securities
should not be void because a higher rate of interest than was
allowed by the statute of 12 Anne had been received thereon.
The statute 1 Vict. c. 80, next enacted, that bills payable
within 12 months, should not for a limited time be liable
to the usury laws and that any person allowing limit had long
been taken thereon or secured thereby, or any agreement to buy or
receive or allow interest in discounting, negotiating, or
transferring any such bill or note, be void, nor any person so
leading to be liable to the penalties of the usury laws; but it
only sanctioned the law which had long been nullified and
forborne any money on the security of land.
The public mind having thus slowly advanced in the direc-
tion of the policy advocated by Bacon above two centuries
ago, at length for the first time took still wider measure,
when in the statute 17 & 18 Vict. c. 90, after many years in
the preamble, that 'it is expedient to repeal the laws at
present in force relating to usury,' proceeds to repeal wholly,
or in part, eleven English, five Scotch, and four Irish Acts,
on which the whole penalties of usury previously rested; and
among these Acts are included those relating to annuity
transactions. [Annuitv.] The natural laws which regulate the
terms on which money can be borrowed are therefore
now left to operate freely, and borrowers and lenders are
renderable to no other rules than those which govern contracts
in general.

(Blackstone's 'Commentaries,' Mr. Kerr's edition, vol. ii.
p. 475.)

UTAH, a Territory of the United States of North America,
lying between 37° and 42° N. lat. 106° and 109° W. long.
It is bounded S. and E. by the Territory of New Mexico;
E. by the Territories of Kansas and Nebraska; N. by that of
Oregon; and W. and S.W. by the State of California. The
area of Utah is estimated at 369,170 square miles. The
population in 1850 was 11,380 (of whom 25 were free colour-
ous persons, and 26 slaves enroute to California), or 04 to the
square mile: but this does not include the native Indian popula-
tion, who were estimated by the Commissioner of Indian
Affairs in 1853 at 11,600.

Surface, Hydrography, &c.—The Territory of Utah occu-
pies for the most part a vast broken depression, known as
the Great Basin, which lies between the Rocky Mountains
to the east and the Sierra Nevada to the west; these lofty
mountains rising in parts above the line of perpetual
snow, while across them are only a few difficult
passes. On the north of the Great Basin there is no con-
nuous mountain chain, the whole being broken by an
elevated tract, which is sometimes a swamp. On the
east the rocky barrier is broken through by the head streams
doing their beds to the Colorado, the only river which finds its way out of the
Great Basin; all the others which flow into the basin from the
east in being joined in their courses by the large
lakes which occupy the bottoms of the larger valleys. The
Great Basin is about 500 miles long, from east to west, and
little less, and some 4000 feet above the level of the
sea. Parallel to the main ranges of the Sierra Nevada and
the Rocky Mountains, there are the Topor ranges, of which
the Wasatch Mountains on the east are the most important.

URLE. [Chemistry, S. 2.]
Some of these secondary chains attain an elevation of from 2000 to 3000 feet; and from these diverge cross ridges, which are separated by wide valleys. A portion of the Great Salt Basin consists of arid plains, on which artemesias and saltcarnions are almost the only plants, but in many parts these plains are so impregnated with salt as to be unfit to support all but the most hardy or salt-tolerant vegetation. This is a singular country for the great valleys. Of these by far the largest is the Great Salt Lake Valley, which is about 120 miles long and from 20 to 40 miles wide, the Great Salt Lake occupying the greater part of the northern portion of it. In so far as the valley is not indented by several small mountains to the shore, it is a small, sandy, irremediable barren, on the north it is a swamp, on the east and south-east, where the Great Mountain range is fertile, the mountains to the shore. The climate of the valley is very dry and mild; but rain seldom falls during the summer months, so that the agriculturalist is to a great extent dependent on irrigation. The other valleys bear a general resemblance to the Salt Lake Valley, but they are much smaller. The chief are—Utah Valley, about 60 miles long by 20 miles wide; Sand Pitch Valley, 45 miles long by 30 miles broad; Bear River Valley, South Valley, Yuba Valley, Cache Valley, and several others. The latter portion of the Great Basin is not distinctly separate from the Great Basin, the Valley of Green River with its tributaries, which occupies the eastern portion of the territory from the Sierra Madre to the Bear River Mountains, is in the latter class, being more than 150 miles long; but it is so elevated and waterless as to have been thought not to contain a single spot available for agricultural purposes. The little valley of the Uintah River, a more southern tributary of the Colorado, is much warmer and more promising, but all this eastern portion of the country is, with this exception, barren.

Utah possesses no great navigable rivers. The Colorado, as already mentioned, is the only river which flows out of the Great Basin, and it is a stream of little consequence till it has flowed some distance along the southern boundary of New Mexico. There are indeed accumulated in the gorges of the mountains unfailing stores of snow, which furnish during the whole of the summer abundant and perennial streams, which in some instances possess a considerable volume of water; but many of these never reach the bases of the mountains, and the great majority are lost in the arid plains. A few find their way to the lakes, but from the lakes, except from one to another, there is no outlet. Some of the streams which connect the lakes are however used for irrigation, and may become of essential importance for manufacturing purposes. The most valuable of these rivers is the Jordan, a rapid stream which unites the Great Salt Lake with the Great Salt Lake City; it is on this river that Salt Lake City is built, and already several manufactories are established along its banks.

Of the numerous lakes which are in the territory the largest and most remarkable is the Great Salt Lake, which lies at the northern end of Great Salt Lake Valley. The lake is about 70 miles long, from 30 to 30 miles wide, and has a shore-line of of 291 miles. Its water is saturated with chloride of sodium (salt). Dr. Gale, who made an analysis of its water for the United States government, says that it contains full 20 per cent. of pure chloride of sodium, and not more than 2 per cent. of other salts, and is one of the purest and most concentrated brines in the world. The specific gravity of the water is 1.70. Several picturesque islands rise from the briny waters. Of these the Great Salt Island is the most remarkable feature of the lake. On the mountains on each side of the lake are several distinct terraces, exhibiting unmistakable evidences of this valley having been at some time the bed of a great inland sea. The other lakes are much smaller than the Great Salt Lake; the water of Lake Utah, which is connected with the Great Salt Lake by the river Jordan, is said to be quite fresh. It receives several streams from the mountains. In the neighborhood of the Great Salt Lake, and in other parts of the territory, there are numerous carbonaceous rocks prevalent. In the neighborhood of the Great Salt Lake rocks of granitic and siliceous character occur, with hornblende rocks, and talcose and mica-schists. The more elevated portions of the mountains appear to consist of carboniferous limestone, which, in some places, lose their granular character, and become sub-crystalline, or threaded with veins of calcareous spar. All the elevated ranges on the north, south, and west of the Great Salt Lake, are composed of the Carboniferous limestone, which generally rests on a coarse granular sandstone. In some localities the sandstones are overlaid with a coarse conglomerate, which is sometimes partly altered so as to assume the structure of a granular sandstone. This conglomerate extends in several places; and along the valleys are tertiary clays, &c. Good building-stone is quarried in the vicinity of Salt Lake City. Of the mineral wealth of Utah little is really known.

Soil, Climate, Productions, &c.—A large proportion of the territory is characterized by a soil which is very rich for horticultural purposes, and which is available for agricultural purposes, though limited in extent as compared with the intervening desert tracts, a much of it of extreme fertility; and according to Captain Sianbury, who made a careful survey of the territory for the government, the best part is watered, and would afford support of a large Though not dense population. These fertile and habitable tracts are for the most part confined to the narrow strips of alluvial land along the bases of the mountains and the bottoms of the warmer and more sheltered valleys. Along the western foot of the Wasatch range occurs one of the richest of these tracts, a narrow slip only a mile or two wide, but stretching for more than 300 miles in length. In the valley of the Jordan it is much wider. The soil on the top of the mountains is rocky and barren, as those of the Tuilis, of the Timpanogos and others of the Traverse Range. In fact the most available part of the Great Basin appears to consist of the valleys along its eastern border, sheltered by the Wahsatch range. The most productive tracts are those of the Jordan, generally covering the more argillaceous rocks, mixed with the debris of the limestones. There also occur in the valley bottoms very rich vegetable and marly loams. So productive are some of the soils that Captain Sianbury says the crops could be produced in three acres and a half of land a yield of 15 bushels; and other authorities speak of 50 or 60 bushels of wheat to the acre as being by no means unusual, but that we can, we think, be no doubt that such must be exceptional cases. The climate of Utah is that of the same parallel of latitude on the Atlantic, and the winters are much more temperate; in the Salt Lake Valley the thermometer seldom descends to zero. But on the higher plains the heat is often oppressive. Over these plains the mirages are frequently observed in the morning light. The eastern section of the country is cold. Throughout its habitable portions the territory rain seldom falls between May and October, and can never be relied on for agricultural purposes. The July thermometer would be irremediable for irrigation, and may become of essential importance for manufacturing purposes. The most valuable of these rivers is the Jordan, a rapid stream which unites the Great Salt Lake with the Great Salt Lake City; it is on this river that Salt Lake City is built, and already several manufactories are established along its banks.

The principal cereals grown are wheat, oats, maize, barley, and rye. Very little buckwheat is raised. The common potatoes grow luxuriantly; of sweet potatoes the crops are limited. All the vegetables peculiar to the middle and western states succeed here. The sugar-beet grows to a large size, and is being raised, though not largely, for making sugar. Cotton, the sugar-cane, and rice will, it is said, grow in some districts, but they are evidently not suited to the climate. Tobacco and flax are raised in small quantities.

A portion of the territory is well adapted for grazing, though the bunch grass on the lower slopes of the mountains, which at present feeds vast herds of antelopes and deer, is burnt during the summer months. Horses are the animals with which the inhabitants perhaps possess the largest proportionate number; but they have a considerable number of cattle, and there is a growing attention being paid to sheep, which are in great request for their wool.

The climate of its natural state is almost destitute of rain. The only time it is not is in the rainy seasons or occasional showers, on the banks of a few of the streams and occasionally on the bases of some of the mountains. Wild game abounds. The antelope, deer, bear, and panther are very numerous. The climate of the state is therefore remarkably favorable to keeping good hunting stock.

The most common kinds are geese, geese, ducks, curlews, plovers, gulls, blue herons, cranes, pelicans. &c. Moquitoses and sand-flies are very numerous and troublesome. But the greatest insect pest is a large kind of cricket, which at irregular periods appears in enormous numbers, and commits terrible ravages.
Utah from its insalutaged situation must be to a great extent known upon its own resources, if the peculiarity of its population did not cherish by every means their separate and independent spirit. The mountains, the deserts and the great and difficult difficulties of all other settled states, with agricultural resources little more than sufficient for the support of its own increasing demands, and without any ample product or material required by the arts or luxuries of life, the latter to the女主都 authorities and the trade and commerce and the amount of external trade and commerce; while there will probably be a sufficient stimulus to the growth of such manufactories as are required for ordinary domestic purposes. With California the regular communication is maintained, and such organized states as have the power of the璇 for the produce of Utah. On the other hand, from Salt Lake City to St. Louis, the nearest considerable market, is upwards of 1600 miles. Some modification would undoubtedly be necessary in order to the lead their followers and the consequent and the consequent consequences to the far distant and nearly unknown country lying beyond the Rocky Mountains—there to seek some secluded retreat beyond the reach of their persecutors. They had been promised to be allowed till the spring to make their preparations for the departure of the first or pioneer party; but their enemies became clamorous, and they were obliged to set out in February 1846, while it was yet winter. The sufferings of this pioneer party were of the most terrible and trying kind; and they struggled on resolutely, planting crops, and otherwise preparing the way for their successors. It is hardly possible to describe any one of the consequences. It was not till July of the following year that the first section of the pioneers reached the promised land. The remainder were soon to follow; for although the authorities had engaged the difficulty of the country for the acquisition of land, and, as is well known, they entered into a treaty with the United States, they elected the usal state-officers, and applied to the federal government to be admitted into the Union as a sovereign state under the name of the State of Deseret. But Congress refused their application, and remitted the state back to a territorial condition, naming it Utah. Brigham Young was however appointed or continued as governor; and the community, though nominally under the laws of the United States, remained virtually independent, and governed by the Mormon legislature. Young was however superseded by the President, who appointed a 'Gentile' governor, and the federal government assumed a more direct control. This led to disputes, and at last the federal judges were expelled, and the government was formed. This led to a war between the federal and Utah. Forces have been sent against it to subdue it. Little impression has been made as yet; there has been no serious fighting; but supplies have been intercepted, and detachments cut off by the Mormons; but the state forces are gradually being strengthened and are approaching their city.

The religious opinions of the Mormons are stated under Sarras, Joseph, S. 2. Here however as Utah is their appointed Zion, it is only a small step to their inalienable authority to an extent in 1848. But the whole of the province had really passed out of the hands of Mexico for some years before the year 1848; sold while the true West of Mexico, or what now forms the state of California, was held in the possession of the citizens of the United States, he Great Basin, hitherto abandoned to the native Indians, is open to any body of settlers strong enough to maintain themselves within it. By such a body it was occupied in 1847. We shall not relate here the early history of that remarkable sect the Mormons, whose occupation of the territory has invested Utah with so singular an interest. [Sarras, S. 171]...
to what we have said of it above, that it stands on the Mississippi, 125 miles N.N.W. from Springfield; and that after the departure of the Mormons, Nauvoo became the seat of a colony of French communists, or Icarians, under the direction of M. Cabot, who were however far from successful. Of the death of the old Prophet the Lord Barbee says: 'the population has dwindled down to a very insignificant number. The great Mormon temple of Nauvoo was, in October, 1846, set on fire by an incendiary and destroyed. (Captain Howard Stanbury, Topographical Engineer, U.S. Exploring Expedition, in the 'Voyage of the Great Salt Lake of Utah'; Fremont, Report of Expedition to the Rocky Mountains; Lient. J. W. Gunnison, The Mormons, &c.; Statistical View of the United States; Seventh Census of the United States; Gazetteers of the United States, &c.)

UVAROV, SERGY SEMENOVICH, or OUVAROFF, as the name is written in French, an eminent Russian statesman and author, was born about 1789 of a noble family, and received his Christian name from the Empress Catherine, to whom his father was side-de-camp. He studied at Göttingen, and in the year 1810 made his first appearance as an author in a 'Project for an Asiatic Academy,' written in French and addressed to the Emperor Alexander, in which he proposed the establishment of a great institution for the study of the languages and literatures of Asia. As a young man he was appointed, young as he was, to the curatorship of the university and educational establishments of the district of St. Petersburg, an important office which he discharged with great success. (The Emperor of the Russian Empire," remarked in a Russian pamphlet, published at the conclusion of the great struggle in 1814, "is now preparing to emerge from chaos and to consolidate its foundations. A stupid tyranny will no longer oppose itself to the efforts of reason, and on the whole surface of the globe it will be permitted to think." When the Emperor Alexander's views became a more retrograde character than they had been, Uvarov, after in vain offering the introduction of some new regulations relating to education, retired, in 1821, from his curatorship, but still retained the post of president of the Academy of Sciences which had been conferred on him in 1818. In the following year he became director of the department of manufactures and internal commerce, and he was subsequently for some years minister of finance. That his influence was not extinct was proved by his being able to establish in 1823 an institution for the instruction of young diplomatists in the Oriental languages, carrying out in some degree his early project. After the accession of the Emperor Nicholas he was sent in 1848 Minister of Public Instruction, a step which excited some surprise, as the tendencies of the new government were certainly not in favour of permitting the liberty to think. From that time till 1846 Uvarov was acting minister of education, introducing botanical gardens, observatories, and educational institutions, and in providing for the better endowment of such establishments, and any deficiency in liberality in their management was attributed rather to the emperor than the minister. In 1848 he again retired from office on occasion of some restrains on education being imposed, of which he did not approve.

The principal writings of Uvarov are rather elegant than profound; they are collected in two volumes, one bearing the title of 'Studies of Philology and Criticism,' and the other 'Political and Literary Sketches' ('Études de Philologie et de Critique,' St. Petersburg, 1843, 2nd edition, Paris, 1845; 'Esquisses politiques et littéraires,' Paris, 1848). All of these essays are in French, except two on philosophical subjects, one 'On the poet Nonnos of Panopolis,' and the other 'On the Anti-Homeric Age,' which are in German. In the preface to the essay on Nonnos, addressed to Goethe, the author expresses an opinion that "is now for ever for every poet to choose for his instrument the language which is best suited to the circle of ideas he intends to treat." He seems however, in spite of the confidence of his tone, to have been for some time desirous of devoting himself to venturing to print in German, and before publication addresses the public in a half, because his tone replied 'Never confide to any German the grammatical revision of your manuscripts. Do not forfeit the immense advantage you enjoy in not knowing German grammar; I have been trying to forget it these thirty years.' Among the few foreigners who have written in that language, Uvarov is admitted to have been one of the most successful. In French, which was in the time of his youth more familiar to him, there are essays Stein and Pozzo di Borgo," 'The Prince de Ligne," 'Venice," 'Rome," &c., are in themselves of interest and are treated in a light and graceful style which never fatigue the reader. Uvarov is reported to have written memoirs of his own time, which may probably form the best portion of his writings in the eyes of posterity.

UWIN, THOMAS, R.A., was born in Pentonville, London, in 1758. Apprenticed to Smith, an engraver of some reputation in his day, he acquired, whilst learning the use of the burin, a certain familiarity with the general principles of design. But having fixed his heart on becoming a painter, he, on quitting Smith, entered as a student at the Royal Academy. Three times awarding himself the medal which Sir C. Bell was then delivering to students in art. For some years he was principally occupied in making designs for book engravings, in which he seems to have taken Stothard as his model, though maintaining considerable originality; but his chief aim was to distinguish himself in painting, which he did, to the general satisfaction of Sir C. Bell, and for many years was elected by him, and the opinions of the judges, as grace. He also made numerous copies of paintings for the use of engravers. At this time he practised almost exclusively in water-colours, and in 1811 he was elected a member (and subsequently secretary) of the Society of Painters in Water Colours. Failure of health having led to a temporary abandonment of his profession, he after a short interval commenced practice in Edinburgh as a portrait painter, having prepared himself by making a series of portraits for book illustrations. In 1836 he visited Italy and the studies which he made during his stay led him to commence painting pictures illustrative of the cheerful outdoor life of the Italian and especially of the Neapolitan peasant. These works painted with a light bright pencil, picturesque in costume, gay in colour, and cheerful in spirit, became at once very popular, and their popularity remained undiminished as long as he continued to produce them. As samples of these many Italian pictures may be mentioned, 'The Mandolin,' 'Drawing for the Festa,' 'Neapolitan Peasantry returning from a Festa,' 'The Fishermen returning from Naples,' 'Interior of a Saint Factory at Naples,' 'Festa della Donna del Arco,' 'Loggia of a Vine-dresser's cottage in the afternoon of a Saint-day,' 'Mountaineers coming down from an alp at Bourbon,' 'A country scene on the 4th of June,' 'Teaching a Child the Tarantella,' 'Children asleep in a Vineyard,' 'Making a Nun.' He also painted some English peasant pieces, as 'The Top of the Stile,' 'The Pet of the Village,' &c., but with less success. Later he painted illustrations from popular authors, Stendhal, Mme. Dorothee, &c.; and still later he essayed a loftier class of subjects, as 'Fear and Cordelia in Prison'; 'Cupid and Psyche' (painted for Prince Albert); 'Psyche returning from the Infernal Regions with the Casket of Beauty'; 'The Reproof'; 'John the Baptist proclaiming the Messiah on the Morning after the Baptism'; 'Judah,' &c.; but these were severely adapted to his pencil. Mr. Uwins was elected a Royal Academician in 1836; and from 1844 to 1865 he held the office of librarian to the Royal Academy. He was also appointed keeper of her Majesty's pictures in 1843, and keeper of the National Gallery in 1847, but he resigned the latter situation after two or three years. He died Aug. 25, 1857, at Staines, in Middlesex. Uwins is represented in the pictures by Mr. Uwins, 'The Vintage in the Clare Vineyards, South of France,' and 'Le Chapeau de Brigard'; in the Sheepsheiks' collection are four more characteristic examples of his pencil—the Mother teaching her Child the Tarantella, another showing a Child in its ammora, 'The favours of the Shepherd,' and 'Suspicion.'

UWAROWITE. [MINERALOGY, &c.]
VALENTIA, HARBOUR OF. [Kerry.]

VALERYLE. [Chemistry, S. X.]

VALLEJO. [California, S. X.]

TOP THAT! A common name for the
Convolvulus majalis. This plant is too well known to need
description. The genus Convolvulus has a bell-shaped
6-parted deciduous perianth; a 3-called 2-ovalled ovary; a
blunt triligious stigma; berry with 1-seeded cells; flowers
yellow. C. majalis, the Lily of the Valley, is about a foot high,
with two ovate-lanceolate radical leaves. The flowers are race-
mose, nodding, pure white, globose, bell-shaped, and fragrant.

VAN DIEMEN'S LAND. [Tasmania, S. X.]

VANCOUVER ISLAND (or Quadra and Vancouver
Islands) lies off the western coast of North America in the
North Pacific. It is long and narrow, extending in a direc-
tion from south-east 42° 24' to north-west 50° 3' N. lat., and
between 122° and 128° W. long., the length being about
60 miles, the average width 50 miles. It is overtopped at
its southern end by the continental headland of Cape Flattery,
and between is the Strait of Juan de Fuca, five leagues wide
near its entrance, and running in an east-south-east direction for
about 100 miles, widening in several parts, extending south-
ward into Puget's Sound, and forming several bays on the
continental shore, then, suddenly narrowing, turning northward through an archipelago of small islands, called the
Arro Archipelago, thence widening into the Gulf of Georgia, and
leading to the Sound of Juan de Fuca, the entrance architected by America. Johnstone's Strait into Queen Charlotte's Sound. Vancouver
first discovered this passage in 1792. There are many bays and
harbours all round the island. Three islands of the
Arro group are separated from the coast of Vancouver Island
by the Arro Channel, which is narrow in its extremities, but
expands to a considerable width in the middle. At Weathuynsen Inlet, which is at the north end
of the Arro Canal, several extensive beds of coal have been
found, the site of which has been named Newcastle. Coal
exists also in the northern part of Vancouver Island. At
the southern end the settlement of Victoria has been formed,
on a harbour named Camaosack, safe and easily accessible
for vessels, but having the drawback of being
exceedingly supplied with water. The other principal harbours
are, Nootka Sound, Clayquot, Nitnnat, all on the
western coast. The shores of the island present an alternation of
rocky cliffs and sandy beaches. At no great distance from the
sea is a compact mass of rugged mountains, whose summits are
covered with pines, and whose sides are intersected by a considerable
quantity of fertile land, covered with good natural grass.
There are numerous small tribes of Indians on the island, of
whom some have been found of a friendly disposition.

The climate is mild. Vancouver Island is a
war with Spain, who claimed it, and had expelled some
English settlers from Nootka, but it was at length resigned
to England, and has since continued in their hands. Van-
couver Island was made over in 1846 to the Hudson's
Bay Company by a charter, on condition that they should
colonise it; the government reserving the right to reclaim
occupation of the island for Great Britain within a specified
time.

North of Queen Charlotte's Sound lies Queen Charlotte's
Islands, between 52° and 54° N. lat. The group consists of
three islands extending about 150 miles in length, by about
60 miles in breadth. In these islands are several excellent
harbours. At Mitchell Harbour, on the middle island, and at
other spots, gold has been found, embedded in quartz.
Traces of silver have been found in the rocks. The
interior of the islands is hilly and well wooded, the climate is
healthy, and the soil remarkably fertile. The islands contain
some beds of coal, and several fine specimens of lead and
copper have been found. The coast is washed by waters
from the north and north-east winds, and has a good bottom,
with a depth of 8 to 15 fathoms. The entrance of the bay
is formed by two steep rocky capes (Galata and Hodrova, or
Sughanilik), 44 miles asunder. The shores sink gradually
to the head of the bay, where in the neighbourhood of the
mouth of the river, they are level. The Faravah River (the ancient Lyr-
gines), which empties itself in the Bala or near Shima, after
turning the two lakes of Devne, discharges itself by a broad
stream into the Black Sea, along the foot of the southern
walls of Varra. The distance between the eastern shore of the
eastern Lake of Devne, and the western shore of the western
lake, is less than half a mile. It has been in contemplation to deepen
the channel of this river so as to admit ships to the lake, which
would thus be converted into a harbour capable of affording
shelter and accommodation to the largest fleets in all weather.
In the isthmus between the two lakes Alexander the Great
defeated the Triballi. The isthmus is from a mile to a mile
and a half broad.

Varma is a wretchedly built town, surrounded by old stone
walls and a dry ditch. It is a place of considerable trade,
the exports of corn, barley, tallow, eggs, and other Bulgarian
produce, amount in value to about 600,000l. Austrian
steamers between Constantinople and Galata put in at Varma.
Under the walls of Varma the Sultan Murad II. in 1444
defeated the Hungarians under King Ladislaus (who was
killed) and John Hunisades. The Russians took Varma in
1828. The Anglo-French army encamped in Varma and its
environ in the summer of 1854, previous to its embarkation
for the Crimea.

VAUQUIEUX UTITE. [Cézambeau.]

VENIRE FACIAS. This writ, and also the other
writs referred to under this head (vol. xxxvi., p. 245), the
disrings and habeas corpus juratorum, have been in effect
abolished by the Common Law Procedure Act, 1852, which
abolishes the law of nisi prius. The only sufficient reason supplied
by the report of the Judges' Committee, which has been
accepted by the Blackstone's
' Commentaries,' Mr. Kerr's ed., vol. iii. (p. 380).

VENUS'S FLY-TRAP. [Dloma.]

VERNAL GRASS, SWEET. 'Anthosanthum.'

VERNON, ROBERT. Though possessing personally no
title to an enduring name, yet as the founder of the National
Gallery of British Art, Mr. Vernon claims an honourable
place in this work. The so-called 'National Gallery' of
paintings was founded in 1854 by the purchase by Lord
Liverpool's government of the collection formed by Mr.
Angenstein. This collection included nine pictures by
British painters — the 'Marriage à-la-Mode' of Hogarth;
that painter's portrait; Lord Heathfield by Sir Joshua
Reynolds; and Wilkie's 'Village Festival.' In the course of the
next twenty-three years the gallery was considerably
enlarged, by occasional grants or presentations of English pictures, but not a single English picture was added to the national collection by purchase:
the entire number of British pictures in the National
Gallery in 1847 was only forty-one, and several of these were
portraits of unknown or insignificant persons by second-rate
artists, or works of little artistic excellence or general inter-
est. In every other country the possession of worthy speci-
mens of the pencils of the chief painters of that country had
been deemed the essential feature of a national collection;
here the National Gallery, according to the official estimate,
was to be a gallery of the works of the 'Old Masters' of
Italy and Holland.

It is to Mr. Vernon that the country is primarily indebted
for what has been done towards placing matters on a more
rational and satisfactory footing. Born in 1774, he by di-

gence, perseverance, and skill, during a long commercial
career, raised himself from very humble into very affluent cir-
cumstances; earning at the same time a high character for
liberality, and enlarged though unostentatious benevolence.
Having a great fondness for pictures, he began, as soon as
his means permitted, to indulge his inclination by purchasing
some, and following his own taste he selected the works of
English artists. In the course of ten years he had thus
ten ever room in his house was filled. He now conceived
the design of presenting his pictures to the nation, in the
hope that if kept together they might serve as the nucleus of
a gallery of the national art. He sold such of his pictures as he deemed undeserving of such a destiny, and
purchased or commissioned (in nearly every instance direct
from the painter) fresh examples of the masters he most
admired. Then—not waiting to make it a posthumous gift—he offered his collection to the government, requesting that all those pictures might be selected which were considered worthy of national acceptance: and that being done, he made them over by a deed of gift, dated December the 22d, 1547, to the Trustees of the National Gallery. The collection so transferred comprised 157 pictures, all but two by British artists, and a large proportion by living artists. The pictures having been selected in the first instance for a private residence of moderate dimensions, are mostly of cabinet size, and to a considerable extent of homely subjects; but they include favourable specimens of a large proportion of the chief deceased and living English painters. Mr. Vernon lived long enough to see that his munificent gift was warmly appreciated by the great bulk of his countrymen; but not to see it provided with a fitting repository. He died May 22d, 1549. Since his decease the Vernon collection has found a temporary resting place in Marlborough House. To it has been added the splendid bequest of Mr. Turner (Travers, J.M.W., & S.); and Mr. Sheepshanks has also presented to the nation his noble collection of 253 paintings in oil by English artists; but his gift is transferred with stipulations as to the place where they are to be deposited, which prevent them from being—for the present at least—placed along with the Vernon and Turner pictures. It is however greatly to be desired that some arrangement may be made by which these collections may be brought together, and thus form the commencement of a National Gallery of British Art worthy of the nation.

A marble bust of Mr. Vernon, purchased by subscription, is placed in the hall at Marlborough House; where also are a marble group by Gibson of Hydas and the Nymphs, and about half a dozen marble busts, presented with his pictures by Mr. Vernon—the somewhat sorry commencement of a National Collection of the works of British Sculptors.

**Vertebra** is the name given to each of the separate bones of which the spinal column of the skeleton of the *Mammalia* is composed. [Skelet. Although in technical anatomy the term is thus restricted, it has recently received a much more extended signification. Professor Owen defines a vertebra as "one of those segments of the endo-skeleton which constitute the axis of the body and the protecting canals of the nervous and vascular trunk; such a segment may also support diverging appendages." According to this definition, the vertebra becomes the type or plan on which all the bones of the skeleton of vertebrate animals are constructed. It is not only a portion of the spinal column, but the elementary form to which all the parts of the skeleton may be reduced. The bones of the head, of the thorax, the pelvis, and the limbs, however complicated, are reducible to the plan of the typical vertebra. In the history of the development of this interesting branch of anatomical inquiry a variety of errors has been experience, as to what may be regarded as the true elements of a typical vertebra. Since in no instance do we find all the parts of the vertebra developed in exactly the same manner.

The diagram exhibits a typical vertebra, according to the plan of Professor Owen.

![Diagram of a typical vertebra](image)

This plan does not include the parts which constitute the diverging appendages. Of this plan Professor Owen says, "The terms in Roman type signify those parts which, being usually developed from an independent centre, I have termed 'autogenous' elements. The italics denote the parts more properly called processes, which shoot out as continuations from some of the preceding elements, and are termed 'exogenous': e.g., the diapophysia, the parapophysia, the hypapophysia, and the zygapophysia of the oblique or articular processes of human anatomy."

The autogenous processes generally circumscribe holes about the centrum, which is in the chain of vertebrae form canals. The most constant and extensive canal is that formed to the centrum, and embraces the central circulating organ (A), the heart, and the large trunks of the vascular system. On the sides of the atlas vertebrae, in the cervical region, rise two other canals, formed by the three lateral elements of the vertebrae, and these often embrace an artery and a nerve. Thus a typical or perfect vertebra, with all its elements, presents the centrum with a central canal, from which the various appendages are developed. A common centre; such a vertebra seen in the thorax of man, and most of the higher forms of vertebrate animals, as in the neck of many birds. In the tails of most reptiles and mammals the hemapophyses are articulated or ankylosed to the under part of the centrum and the space is filled with fat only for the caudal artery and vein. But where the heart is to be lodged an expansion of the hemal arch takes place, analogous to that which occurs in the neural arches when the branchial arches in man are completed. In the same manner that the parts of the thorax, spinal column, and skull, may be traced to the elements above referred to, the parts of the two pairs of locomotive organs with which all vertebrate animals are endowed may be traced to a common stem, and the diverging appendages of which all are others are most subject to change—now developed to an enormous extent, and again almost entirely disappearing, according to the necessity of adapting the animal to its special habits. With the exception of the posterior and anterior extremities of the four appendages of man, all the parts are of limited degree. It is through the study of these appendages that the pectoral fins are seen to be the homologues of the anterior extremities in the reptiles, of the wings in the Birds, of the flippers and of the limbs in the mammals, the flippers of the seals and whales, and of the arms in Man. In like manner the abdominal fins of fishes are the homologues of the legs in Birds, and of the posterior extremities of the Reptiles and Mammals, and the legs in Man. These homologues include not only the totality of these organs, but the individual parts, and the scapula, clavicile, coracoid process, humerus, radius, ulna, carpal and metacarpal bones, and phalanges, in the higher mammals and Man have their homologues, and the branches of the thoracic vertebra. So with the pelvic arch, with its ilium, ischium, pubis, femur, fibula, tibia, taral and metatarsal bones, and phalanges.

We have not space here to enter into the details of the application of this general plan to the structure of the skeletal system of mammals. This has been done in a masterly manner by Professor Owen, in his 'Report on the Homologies of the Vertebrate Skeleton,' published in the 'Transactions of the British Association' for 1849, and also subsequently in an independent volume devoted to the same subject. This department of anatomical inquiry is no longer a matter of ingenious hypothesis and verbal speculation, but has been placed by this inquirer, through the unerring principles of comparative anatomy and development, upon the firmest basis, and may be regarded as an essential part of scientific truth.

**VICO, FRANCESCO DE,** one of the most distinguished astronomers of modern Italy, the son of Count Ascanio de Vico-Ubaldini and the Countess Analia Archinto, was born at Macerata on the 16th of May 1699. He was educated partly at the Collegio dei Nobili in Urbino, partly in the school of the well-known congregation of the Scuolat at Siena, and entered the Jesuit Society as a novice in 1823. After spending with much distinction throughout the usual stages, both as a scholar and as a master, in the Roman College of that Society, he was appointed (in 1833) assistant of Father Stephen Dumouchel, who was at that time in charge of the observatory; and it was a sort of preface of the history of his all future work. In the fall of the following year he was to calculate the time of the appearance of the then expected Halley's comet, both according to the elements of Damoiseau and to those of Pontecoulant. The young astronomer was in the midst of a general satisfaction of being the first to observe this comet, on the 5th of August 1835. Soon afterwards, Vico, in consequence of the great age of F. Dumouchel, becoming
the principal astronomer of the Roman observatory, undertook a long series of observations for the purpose of ascertaining the suspected error in the latitude of Rome, as determined by his illustrious predecessors, Boscovich, Calandrelli, Conti, and Reichenbach. These observations, which amounted to nearly 8000 in number, were eminently successful, and the result was a correction of an error of two seconds in the received latitude. He engaged at the same time on a similar series of observations for the longitude, in connexion with Airy, which was completed in 1850. Subsequently, Father De Vico, at the instance of Schumacher of Altona, undertook a course of observations of the planet Venus, for which the clearness of the Roman atmosphere was peculiarly adapted, with a view to the determination of the parallax of the planet. This work, which the author has so fully described, contributed more than all his previous labours to establish his reputation among the astronomers of Europe; and his subsequent observations of the satellites of Saturn, and of the inner ring of that planet, as well as all his detailed reports on the nebulae, which about that time became a prominent subject of interest, fully sustained that reputation.

Father De Vico however is most popularly known as an observer of his numerous and successful discoveries in the cometary system, which he was one of the earliest in most recent times to take up as a systematic study. During the years 1845, 1846, and 1847 he discovered no less than eight of these comets, in which his claim to priority of discovery is undisputed. The eighth had been observed by another astronomer two days before it was discovered (independently however) by Father De Vico. Another more humble but hardly less useful work undertaken by Father De Vico is the improvement of the system of astronomical maps and charts, in which he is said to have made considerable progress; but in this and other works which he had commenced, he was interrupted by the Revolutions of 1848, by which, in common with the other members of his order, he was driven from Rome. He was treated with much distinction during his exile by his fellow-astronomers in France and England, and received more than one invitation to fix his residence in either of these countries; but the circumstances of his order at that time deterred him upon establishing himself in the United States of America, and he had almost completed his arrangements for the purpose, when he was seized with acute inflammation of the chest, and was carried off after a short illness. He died in London on the 15th of November 1848, at the early age of forty-three. Father De Vico is chiefly known in literature by his contributions to the 'Raccolta Scientificia,' a scientific journal which owed its origin principally to himself, and which still continues to appear in a new form.

---

**VIC**

*Augusta Victoria; on March 18, 1848, Louisa Caroline Albertia; on May 1, 1820, Arthur William Patrick Albert; on April 7, 1853, Leopold George Duncan Albert; and on April 14, 1857, Beatrice Mary Victoria Feodore.*

*We consider it desirable, in the instance of our present Queen Victoria, to take a public notice of certain events which so completely belong to our own immediate times, to deviate from the plan which has been pursued in the biographies of the other English sovereigns. A connected historical sketch would be without any real value; but, as it is a subject of considerable interest, and we therefore prefer to notice, in the dry form of a chronological abstract, the most prominent circumstances of the past one and twenty years. The historian of this remarkable period will point to it as an epoch of unparalleled progress in all the arts and sciences. The industrial world is rapidly advancing in the steady advance of the most enlarged principles of political action, without the slightest disturbance of that respect for law and order, in the absence of which no accession of freedom can be permanent. He will mark a growth of industrial prosperity so mighty and so rapid, that it could only be accomplished by a people living under the stability of a monarchy and the liberty of a representative government. He will see the happiest development of the aim at an universal education, and to be effected by the influence of law, but with an accelerated energy at every step, which gives the hope that the inequalities in the condition of the people may become far less onerous than in any previous period, and that the spirit of concord and community more widely spread by common interests than any other in the world. He will dwell upon the progress of the civilizing Arts—how Music has again become an enjoyment for all; how Painting has received a more important impulse in the extension of taste, and how it has become more than an amusement; how the branches of Art have come to the aid of manufactures; how, if Literature has become less bold and original, it has applied itself to the advance of the knowledge and amusement of a body of readers, who have increased tenfold since the queen Victoria came to the throne. He will record the growth of the domestic virtues; the universal contempt with which the low indulgences of a former generation are regarded; and with some differences upon minor points of doctrine and ceremonial observance, he will see the religious principle which has ever distinguished Protestant England prevails throughout the land in companionship with that spirit of free inquiry, derived from our scientific progress, from which truth has no reason to shrink. How large a portion of the great characteristics of our time have been derived from the influence of the personal character of Queen Victoria, the future historian will feel it his duty to set forth. It is impossible for any thinking man, who has regarded the history of the last quarter of a century, not to feel how essentially that rule has contributed to the welfare of his country. It is a great feature of this reign, that during seventeen years it was a reign without the excitement of foreign warfare. A prince with martial propensities might have got into difficulties, but a prince with the character of a true statesman, with the record of some events which have a natural bearing upon the great characteristics of the reign of this queen. But there are others, far more numerous, and some more important, which cannot be indicated in such a form. We only attempt to offer an aid to the history of the time, when he desires to know the date of some remarkable occurrence which belongs to the public history of the period. 1837. June 20, Queen Victoria succeeded to the throne, and was proclaimed Empress of India. October 10, William IV. succeeded his brother as King of Hanover, as the succession is restricted to males, and thus the connection of the royal family with the Continent was warded off for at least 153 years. July 6, William IV. was buried at Windsor. December 29, the American United
States steamboat Caroline, which had brought assistance to the rebels, was attacked and burnt, on the territories of the United States.

1838. January 5, the Canadian insurgents, under Dr. MacKenzie, surround Toronto, but are repulsed by the governor, Sir Francis Bond, and a proclamation of the President of the United States forbids the attacks of its citizens on the possessions of another nation. Royal Tariff change was burnt down. January 16, the Earl of Durham was appointed governor-general of her majesty's possessions in North America, with extraordinary powers, in order to effect the adjustment of the disputes there. April 23, the Sirius (which left April 4) and Great Western (April 6) steam-ships arrived at New York from England, being the first vessels which crossed the Atlantic by steam power alone.

May 31, a lunatic named Thon, who assumed the name of Sir John, took possession of half kind of Jerusalem, having excited a number of deluded followers against the Poor-law Act, a contest ensued with the military near Canterbury, and Thon having shot two men was himself shot by one of the soldiers. June 28, the coronation of Queen Victoria, attended by Marshal Soult, the old opponent of the Duke of Wellington, as ambassador from the King of the French. July 31, the new Irish Poor Law and the International Copyright Acts were passed. On August 4, Lord Stanley, master of the rolls and chancellor of the Irish Tithe Commissions Acts were passed. August 16, the Queen prorogued parliament. On September 17, the London and Birmingham Railway was opened throughout its entire length. October 9, the Earl of Durham declared his resolution to use the force of the state, if necessary, in sequence of some of his proceedings being disapproved. November 1, the rebels were defeated at Napierville. On November 4, there were riots at Montreal. In November, intelligence was received that Sit Mohammed Khan, the chief of Cabul, had joined Persia with an intention of attacking the British possessions in India, whereupon the governor-general had adopted the course of Shah Soojah in his claims on the throne of Afghanistan. [AFGHANISTAN, S. 11] November 12, the first men in Union were in the Cape, in Upper Canada, and the insurrection was wholly suppressed. December 12, a proclamation was issued against illegal Chartist assemblies, several of which had been held at night in various parts of the country, those attending them being armed with guns, pikes, &c.

1839. January 7, the Academie des Sciences at Paris made a report on the invention of M. Daguerre, the originator of the daguerreotype process, which has been followed by telegraphic processes. Troops of the East India Company occupy Aden. May 6, the government having been defeated in the House of Commons on a bill for suspending the constitution of Jersey and the Channel Islands, the Assembly had refused to pass the prisons' bill, Lord Melbourne announced the death of Lord Melbourne, and the Lord, that the ministry had resigned. On the 8th, Sir Robert Peel received her Majesty's commission to form an administration; but owing to the refusal of the Queen to dismiss the ladies of her household, he declined the commission, and on the 10th Lord Melbourne was reinstated.

June 6, ratification of the treaty for the separation of Holland from Belgium. June 14, the Designs Copyright Act passed. July 15, Chartist riot at Birmingham suppressed by the military, but not till a large amount of damage had been done. August 17, the Postage Act passed, enacting a uniform rate throughout the kingdom for all letters not exceeding half an ounce in weight, and it gave the Treasury the power of entrepot duties, though it was ultimately only a farthing per penny. This was done by reducing all rates above 4d. to that sum, leaving all below 4d. unaltered. It came into operation on December 5; and on January 10, 1840, the uniform half-ounce rate was reduced to one penny. The Act was for one year only, but it was continued in 1841. November 4, Newport in Monmouthshire was attacked by a party of Chartists, estimated to number about 10,000 men, under the command of John Frost, an ex-baptist. They were led by Mr. John Frost, a part of special constables, assisted by about thirty volunteers. The rioters broke the windows of houses, fired on the inmates, and the mayor was wounded; upon which the soldiers fired, made a sortie, and dispersed the mob, of whom about twenty were killed and wounded. The number of the leaders was apprehended; on December 31, they were tried, found guilty of high treason, and sentenced to death, but the punishment was commuted to transportation for life, and in 1850 a free pardon was granted to them. Government announced her intended marriage with Prince Albert. November 24, the trade between England and China was stopped by order of Lin, the Chinese Imperial commissioner.

1840. January 11, a Charter was contemplated at Sheffield, but was called off, and some of the leaders being apprehended. Slight disturbances took place about this time also, in a few other towns of the North. January 16, parliament opened by the Queen, and Lord John Russell brought before the House a bill, which was introduced by Mr. Parnell, who had brought an action against Harsand, the printer to the House, for a libel contained in some of the papers printed by order. He had obtained a verdict, issued execution, and the author of the libel fled to America. January 30, a note, complaining of the establishment of a monopoly of the trade in sulphur guaranteed to a French company, in contravention of the treaties with England. As the Neapolitan government refused satisfaction, an English fleet was ordered to Naples to protect the shipping of the English, and the mediation of France hostilities were prevented, and the sulphur trade restored to its former course. May 6, the new stamps and envelopes for pre-paid letters came into use. June 4, the Act for the better effecting Tithe Composition in England and Wales received the royal assent. July 3, the fort of Amoy, in China, was destroyed by the English fleet, and on the 10th, the island of Chusan was taken. July 23, the Act for uniting the provinces of Upper and Lower Canada received the royal assent. Near Paris, on August 9, the sale of children to sweep chimneys, and on August 10, that for regulating Irish Municipal Corporations, received the royal assent. August 11, the parliament was prorogued. August 25, the Carlist insurrection in Spain having been suppressed, the English auxiliaries evacuate San Sebastian and Passages. December 8, Mehomet Ali, of Egypt, who had been for some time resisting the claims of Lord Turkish to the sovereignty over Egypt, who had invaded and taken possession of the country, having surrendered Ireland and France, accepted on this day the terms the proposers of. Commodore Napier with an English fleet had greatly distinguished himself by his successful attacks on Beyrout and Acre. December 16, the remains of Napoleon, who had been interred at St. Helena, were that day deposited with great ceremony in the Hotel des Invalides, having been brought to France by a French squadron under Prince de Joinville.

1841. January 9, a meeting of the Repeal Association was held in Dublin, to receive the accounts of the preceding year; and during the spring several monster Repeal meetings were held to bear the addresses of Daniel O'Connell, some of which were attended by as many as 150,000 persons. Jan. 9, the Bogue forts at Canton were attacked and taken by the British forces. January 20, after some further hostilities, the Chinese government proposed terms, by which Hong Kong was ceded to Great Britain, direct official communica- tion between the two countries was admitted, the British were opened to trade, and an indemnity of six millions of dollars paid. January 26, parliament commenced its sittings. Feb. 10, the union of the Canadas proclaimed at Montreal, and Lord Sydenham took the oaths of office. February 18, a dinner given to Lord John Russell in London, to celebrate the foundation of the most recent colony of Great Britain—New Zealand. March 15, at a meeting of the Vice-Chancellor, heads of houses, and proctors, of the University of Oxford, a resolution was passed condemning the Puseyite Tractarians, and a separate meeting called. Father Mathew continues his efforts in Ireland in favour of temperance. On this and two succeeding days, he was said to have administered the pledge to 120,000 persons.
country. April 25, a meeting called by the Archbishop of Canterbury, in London, to raise funds for sending out bishops to the new colonies in New Zealand, the same day, the preliminary expedition of the second colony to New Zealand sailed under the command of Captain Wakefield; the colony to be formed on the principle proposed, limited the area, and applying the land produce fund to the expenses, was at the last minute altered. Sir Robert Peel, in a letter to the Times, May 18, a great meeting held at Manchester, to petition for a total repeal of the Corn-Laws. Many other meetings for the same purpose were held throughout the country, some of which were disturbed or interrupted. May 30, the case of the seven ministers of the presbytery of Strathbogie was brought before the Assembly of the Scottish Church; when they were suspended for having obeyed the order of the civil courts in the trial. A large minority protested, and a numerous meeting was held in Edinburgh on the following Monday (31st), to express their sympathy with the deprived ministers. On the 27th Sir Robert Peel brought forward a resolution in the House of Commons to appoint a Select Committee to possess the confidence of the country. June 4, the debate terminated, and the resolution was carried by 313 against 311. On the 7th, Lord John Russell informed the House, that in consequence they should appeal to the country. On the 21st, the Select Committee reported favorably on this amendment to the address was moved by Sir R. Peel; and after a debate, the amendment was carried. On the 30th, the ministers announced their resignation, and Sir R. Peel was commissioned to form a new ministry. In September, according to official returns, the_populace sent the extreme distress of the manufacturing districts of the country. October 4, a great fire occurred in the Tower, which destroyed the storehouses and the small-arms armoury. December 31, Lord Ashburton was appointed to a special mission to the United States, in order to settle the various differences between the two countries, which he concluded in January 1842.

1844. January 17, the first stone of the new Royal Exchange was laid at Ho' of London. June 6, the deputys of the Anti-Corn-Law Association assembled in London, to promote its objects. April 29, a new law for a graduated scale on the importation of foreign corn received the royal assent. May 4, the Boers of Port Natal having threatened Cape Town on the Cape of Good Hope, were defeated by Captain Smith with a small force, whom they were beaten in a second action on June 26, and forced to submit. May 20, John Francis fires a pistol at the Queen, who escaped unjured; Francis was tried for the attempt at the Old Bailey, found guilty, and sentenced to be hung, but the punishment was commuted to transportation for life. June 4, there were riots at Cork and Ennis, occasioned by want of food arising from the potato rot in 1841; and great distress and discontent continued to exist among the manufacturing population of England. June 18, the treaty with the Chinese not having been ratified, the British forces entered the river Yang-tze-Kiang, and seized several forts with numerous cannon; and on the 8th they took possession of Shanghai. June 32, Sir Robert Peel's bill imposing an Income Tax of 7d. in the pound on incomes of 150l. a year and upwards received the royal assent. July 9, a deputation from the Anti-Corn-Law Association waited on Sir R. Peel, to protest the extreme distress. July 20, a law received the royal assent, bestowing a representative government on New South Wales. August 8, a serious riot took place at Manchester owing to the distress, and the riots extended subsequently to other towns in the north of England. August 26, the Queen and Prince Albert visit Scotland. September 30, a special commission was held to try the offenders in the late riots, when fifty-four were convicted, and sentenced to various periods of imprison.

1845. January 9, O'Connell announced at a weekly meet-

Ding of the Repeal Association that "1845 is and shall be the great Repeal Year." January 20, Mr. Edward Drummond, the private secretary of Sir Robert Peel, was murdered at Cross by a man named M'Naghten, who was acquitted on March 4, on the ground of insanity, and removed to Beth lehem Hospital. On February 2, parliament assembled. February 17, the forces of the Army of the Nile defeated Sir Q. Napiers, at Tel-el-Ksela, and took the town, the Hydraulic Dale, and subsequently annexed Sine to the British empire. [Sino, S. 1; Indian Empire, S. 2.] About the end of this month, the Rebecca Riots took place in Wales, the object of which was the remission of the land taxes. The disturbances continued through several months. March 25, the Thames Tunnel was opened. May 18, the succession of the supporters of the non-intrusion principle took place from the General Assembly of Scotland, when above four hundred ministers resigned their seats. May 30, the Queen and Prince Albert visited the colony of the Cape of Good Hope. July 3, the Cartoons for the embellishment of the new Palace at Westminster were exhibited to the public. August 17, an Act for the pacification of the Scottish Church and of the royal assent, had had effect in staying the disruption. August 22, a great Repeal Meeting held on the hill of Tara. August 24, parliament was prorogued. August 26, the Queen and Prince Albert embarked at Southampton, on a visit to Louis Philippe at the Chateau d'Eu. September 10, the Queen arrived at Ostend. September 25, the Queen and Prince Albert visited Brussels and other towns of Belgium. October 7, the Irish government issued a proclamation forbidding the Repeal meetings, and O'Connell recommends submission. On the 14th, Mr. O'Connell, his family, and several other leaders were arrested, and committed to bail on a charge of conspiracy and sedition. October 27, the Welsh special commission opened at Cardiff for the trial of the Rebecca rioters, the principal culprit being a young farmer, who was sentenced to imprisonment for twenty years, with hard labor. November, the bills were passed, and the real wealth of Ireland was restored to liberty. March 5, Mr. Pritchard, the British ex-consul at Otaheite, was seized and placed in confinement, by M. Breut, the French governor, whose conduct, after much contention, was subsequently disavowed by his government. April 19, President Campe at Mexico and the United States was rejected by the Senate. On May 11, a meeting was held under the presidency of Lord Ashley, for improving the habits of the poor. June 1, the Emperor Nicholas of Russia visited England. June 6, the Faculties Act, regulating the employment of children and young persons, received the royal assent. June 14, a discussion was raised in the House of Commons on the subject of Sir James Graham opening letters at the Post-office. He contended that he had the right, but would give no further explanation. The letters said to be opened were addressed to Mazargn, and the information thus obtained had enabled the Austrian government to seize the brothers Bandiera, who had landed in Italy for the purpose of creating an insurrection. A Committee of Examination was appointed by Lords and Commons, but they only reported that the power had been occasionally exercised. July 29, a treaty was signed between England and Hanover for the settlement of the Stade duties. August 19, the new baths were held in Man-

chester for the formation of public parks, and 25,000l. were subscribed by November 1. September 6, parliament was prorogued. November 19, a meeting was held at Birmingham, for the establishment of public parks and baths. 1846. January 11, the Act for the establishment of certain charitable endowments was introduced in the House of Commons. February 4, parliament was opened by the Queen in person. On the 14th, Sir Robert Peel made his financial statement:
he proposed to continue the income tax, to repeal all duties
on export, to abolish the duties on 430 articles which yielded
only a trifling income, also those on cotton-wool, glass, and
staves, and to substitute an annual licence for the auction
duties; these were ultimately carried. March 6, Sir Robert
Peel's bill to enable the new ministry to establish a number
of postal offices, which was passed on March 14. May 5, a haizar in
aid of the Anti-Corn-Law Association was held in Covent
Garden Theatre, by which 25,000, of its membership, were
realised. On the 22d a meeting was held in London for the establishment of
banks, under the protection of the British-guarantees, in
the United States. May 23, the arctic expedition of discovery,
scribed by Sir John Franklin, sailed from Greenhith, and,
unfortunately, never returned. May 25, a terrible fire took place
at a village near Londonderry, by which 2,947 houses were destroyed,
and 20,000 persons left destitute; parliament voted 20,000l.
for their relief; subscriptions were raised, and collections were made in all
the churches, under the authority of the Queen's letter. May 29,
a new convention between England and France for the better
suppression of the slave trade was signed. June 15, a French
and English squadron attacked Madagascar, in consequence
of the Queen of Madagascar having threatened the traders of
those countries with expulsion: they destroyed some forts
and part of a town, but nothing satisfactory was accom-
plished. June 30, Sir R. Peel's Act for the endowment of
Maynooth College received the royal assent; and on July 1, the Acts for the establishment of museums in large towns,
for the promotion of the study of the fine arts, and for
the amendment of the Poor Law in Scotland. October 31,
Mr. Waghorn arrived with the East India mail, which he
had brought for the first time by the Overland route.
During this month the railway mania reached a crisis, and
panic ensued; Sir Robert Peel was again called upon for
re-election. October 19, the Irish Roman Catholic bishops condemn the new
colleges. November 22, Lord John Russell issues his letter
to the electors of London, declaring for a total repeal of the
Corn Laws. December 7, it being having been previously under-
stood that there had been many discussions in the cabinet
on the subject of the Corn Laws, it was made known that
ministers had resigned, and that Lord John Russell had been
sent for to form a ministry. On the 20th, he having failed,
colin Peel was again summoned for re-election. 1846. January 3,
the corporations of London and Dublin
presented addresses to the Queen representing the sufferings
carried in Ireland by the potato-rot of the previous year.
January 5, a meeting of agricultural labourers was held at
Wootton-Basset in Wilts, at which they petitioned for
the abolition of the Corn Laws. January 11, the New
Zealand chiefs, who had previously committed several outrages
on the British settlements, were attacked and defeated : on
the 16th, the surrender of the settlement and disband-
ment was opened by the Queen, who referred to the failure
of the potato crop, and recommended the consideration of
the propriety of relieving protective duties. On the 27th Sir R.
Pee!, in a speech tendered on March 13, potatoes having risen to a famine price in Ireland,
a treasury order was issued allowing the importation
of Indian corn, rice, and buckwheat, at a nominal duty of one
shilling per quarter. April 4, the governor of the Cape of
Good Hope commenced a war upon the Caffres, who had
been committing depredations on the colonists. June 9, the
town of St. John's, Newfoundland, was destroyed by fire;
the damage done amounted to 1,000,000l. June 12, a treaty
with the Choctaw nation for the cession boundary was agreed upon by the senate at Washington.
On the 26th the Corn Duties Repeal Act, and the Customs
Duties Act, which gave great freedom to commerce, received
the royal assent. On the same day, on the motion for the
second reading of the Protection of Life Bill (a coercive
measure for Ireland), the ministers were defeated, and imme-
diately resigned. On July 6, Lord John Russell and other
members of the new ministry were sworn into office. July 28, W. S. O'Brien and many others seceded from the Repeal
Association, because it was not to be permitted to obtain
their object by physical force. August 26, an act for the establishment of Public Baths and Washhouses received
the royal assent, and also the Act for establishing County
Courts in Ireland. August 27, the Star Chamber in
Ireland declared by proclamation to be in a state of distress, and
the provisions of the Labour Rate Act were directed to be put
in operation in them. September 14, a formal protest was made
by the British government against the marriage of the Duke
de Montpensier, a son of the King of the French, with
the sister of the Queen of Spain. October 2, the distress in
Ireland continuing, and the provisions of the Labour Rate
Act proving worse than useless, the lord lieutenant issued a
circular authorising the undertaking of works of permanent
utility in the parishes; the minute was signed by all the
parishioners. December 18, a meeting was held in Edinburgh to consider
as to the best means of relieving the distress in the Highlands
and Islands of Scotland, where 300,000 persons were without
the means of sustenance. To be reprinted. 1847. January 2, the British Association established, by
which large sums were raised by subscription for the relief
of the distress in Ireland and Scotland, in both of which
parishes the provision of a labour rate had failed. In the
same month the new parliament was opened by the Queen, who directed
the attention of the Houses to the great distress prevailing,
and called on them to provide measures for its relief. May 13,
Daniel O'Connell died at Genoa, while on his way to Rome.
June 6, the new Irish Poor Law Bill received the royal assent;
and on the 21st, that for the improvement of towns; and
on the 23d parliament was prorogued. October 17, thank-
givings were offered up in all the churches for an abundant
harvest. October 29, in consequence of a great monetary
pressure, the temporary suspension of Sir R. Peel's Bank
Restriction Act was ordered, and the order was withdrawn
November 23. November 18, parliament re-assembled, and
passed an Act for the suppression of crime and outrage in
Ireland. 1848. February 21, the revolution commenced in Paris
by which Louis Philippe ceased to be King of the French.
On the 24th the king abdicated. On the 26th the republic
was proclaimed, Louis Philippe and his family having
survived in England. At the beginning of March, April 10, a
proposed great Chartist demonstration on Kennington
Common, near London. The government however had appointed
special constables; an intended procession was prevented,
and the affair passed without a struggle. In the Blackwater trials in
Ireland commenced; the jury could not agree in a verdict
as to Mr. O'Brien and Mr. Meagher. Mitchell was tried on
May 22 for seditious writing in the 'United Irishman,' found
guilty, and sentenced to fourteen years' transportation.
July 20, an engagement took place between the Irish rebels
and the government forces at Ballingarry; the rebels
were easily defeated. On August 5, W. S. O'Brien was captured,
and on the 12th Meagher, O'Donohue, and Lyne. August 20,
twenty Chartist leaders were arraigned at the Quebec state
trials. August 29, Sir H. Smith defeated the rebels under Pretorius at
Bloem Platta, in the Cape of Good Hope colony. August 31, the Health of Towns Act received the royal
assent. September 30, the Chartist trials were concluded in
Londonderry. September 28, twenty-five leaders were arraigned at the Blackwater trials. October 9, the trial of the Irish
rebels concluded, and O'Brien, Meagher, O'Donohue, and
M'Manus were sentenced to death. 1849. January 18, the
Corinthian insurrection against Austria and the popular risings in Germany succeeded the revolution in France of 1848, but Great Britain took no part in these
comitios. May 11, on the appeal of Smith O'Brien and others to the House of Lords the judgment was
confirmed, and on July 9, they were all transported. On
May 13 a large meeting was held at Cape Town to protest
against the attempt to make the Cape a penal settlement, and the efforts made were ultimately successful. On June 26, the Act for repealing the Act for the
18th the Irish Encumbered Estates Act. In August a report was furnished to the Cabinet at
Washington by Colonel Mason, confirming the discovery of
vast quantities of gold in California. On September 16, prayers
were offered up in the churches for the removal of the cholera,
which had been long raging in England. On November 5,
Russia and Austria demanded the expulsion or imprisonment
of the Hungarians who on the defeat of the insurrection had
taken refuge in Turkey; Turkey refused to comply with the
enquiries, and on November 7, Russia declared war against the fleet that entered the Dardanelles. December 1, the Dowager
Queen Adelaide died. December 16, a large assemblage
of tenant farmers and cottiers took place at Mullinahone in
Tipperary.
Rothchild, having been elected for the city of London, attended the House in order to take his seat, but was refused because he objected to take the oaths on the faith of Christ. August 5, the Act for regulating metropolitan police was passed, providing an assembly, officers, and over 2000 police, who formed the royal assent, as also an Act for the better government of the Australian colonies, forming Victoria into a separate colony, and giving it a representative legislature. August 14, the Act excluding from its Domain Diana's Mount, the residence of the Investigator, discovered the North-West Passage by Prince of Wales's Strait. The ship was subsequently frozen up, and the crew were not rescued till April, 1852, when they made their way over the ice to Melville Island. November 23, a meeting of the clergy of the Established Church was held at Oxford to protest against the pope's bull, which was followed by public addresses for the same purpose to the Queen from various parts of the country. December 31, Sir Harry Smith, governor of the Cape of Good Hope, declared war against the Caffres. He had been attacked by them and narrowly escaped on the preceding day, and the Caffres defeated our troops in several places.

January 1, 1853, Earl Grey, with a despatch places the Clergy Reserves on the agenda of the legislative council of Canada. February 4, Parliament opened, and the Queen alluded to the Ecclesiastical Titles bill, as occasioned by the pope's recent bull. February 29, the Russell ministry resigned, and the smallness of their majority against Mr. Disraeli's motion in favour of agricultural protection, and of Mr. Locke, having carried a motion against them in favour of the extension of the county franchise. On the recommendation of the Duke of Wellington the chancellor resigned his places on March 3. May 1, the Great Exhibition of the Industry of all Nations in Hyde Park was opened by the Queen. May 22, the governor of New South Wales issued a proclamation, declaring gold diggers without license. The discoveries of gold in some places on March 23, Rossell arrived at Southampton, on the 30th he went in procession to the Guildhall of London, where an address from the city was presented to him. November 6, the Caffres defeated a British force at Waterloo. December 22, the Prince of Wales, as representative of the legislature, visited Cavigia, Changan, Thiers, and others, and on January 2, 1852, his continued authority was voted by 7,439,316 votes against 640,737.

1852. January 1, the Roman Catholic synod of Thuringen proclaimed a church for Austria for the Catholics in whatever is their country in Ireland. February 3, the parliament met; on the 20th the ministry were beaten on the Local Militia Bill, and on the 23rd they resigned; they were succeeded by one under the presidency of the Earl of Derby, who, on announcing his acceptance of office on the 27th, deprecated the attempts which were being made to produce a panic-fever of invasion by the French. April 13, Major-General Cathcart, who had superseded Sir H. Smith as governor of the Cape, issued a proclamation, recognising the independence of the Boers of the Vaal river. June 1, the electric telegraph between England and Ireland opened for communication. June 21, the independence of Greytown was guaranteed by the English and American governments. June 30, the Act granting a representative constitution to New Zealand received the royal assent. July 1, the parliament was dissolved. July 3, a great Tenant-Right meeting at Waringstown in Ireland, at which Mr. S. Crawford, M.P., attended, was held. July 19, a great Free Trade banquet held at Manchester, which was attended by 3000 persons. November 23, three ships arrived in the Thames with a large quantity of Australian gold. December 16, in the new parliament which had assembled, the Metropolis, the Naval and Military, the Home and Imperial, the Canadian, the Colonial, the Local, and the Naval and Military. The French budget by 305 against 296; they immediately resigned; and on the 27th the Earl of Aberdeen announced that he had accepted office, and formed a new ministry.

1853. January 5, the Emperor of China legalised the importation of opium, in order to make it contribute to the revenue. March 9, a treaty with the Caffre chiefs was concluded by General Cathcart at King William's Town. May 3, Prince Mzenziko presented the Russian ultimatum to the Turkish government, claiming for the sar there, the protectorate of the Greco-Turkish and the Russian empire. The Russian mission was rejected. May 12, the Industrial Exhibition opened at Dublin. June 26, the Emperor of Russia issued a manifesto against Turkey, and announced the march of Russian armies to the relief of Turkey in the event of war against Russia. October 25, the French and English fleets entered the Bosphorus. December 5, a protocol was signed at Vienna by France, England, Austria, and Turkey, for the maintenance of the integrity of the Turkish empire. February 20, the Grenadier and Coldstream guards embarked at Southampton for Turkey, and other troops followed in rapid succession. March 11, the Queen reviewed a fleet at Spithead previous to its sailing for the Baltic. March 28, war declared by England against Russia. April 22, Odessa bombarded by the French and English fleets. June 7, a treaty concluded at Washington for facilitating the intercourse of the British North American colonies with the United States. June 8, the Crystal Palace at Sydenham opened by Queen Victoria. June 16, the Act for enabling the American tax, on account of the war with Russia, received the royal assent. August 7, the act regulating Oxford University received the royal assent. August 16, Bomarsund was surrendered to the allied fleet. September 14, the allied army landed in the Cimes, after scattering the Russian forces by fire and sword, and leaving the country in the preceding month. On the 15th the Russians evacuated Moldavia, and the Danubian Provinces were garrisoned by the Austrians. On the 20th the battle of the Almas took place, and the Russians were defeated. [AGLAN, LORD, &c. ; SAINT-CHANT, MARCHEAUX, &c. ; S-car, Lord.] On September 27, Sebastopol commenced. November 5, the battle of Inkerman, when the Russians were again beaten. On the 14th a violent storm destroyed many ships laden with stores, and on the 15th the fleet was dispersed. December 1, the season of great suffering: the roads were impassable; the weather was bitterly cold; men and horses, ill supplied with food or shelter, perished in large numbers, while medical attendance and hospital accommodation were woefully deficient. Great dissatisfaction was expressed at home, and private subscriptions to a large amount were raised to alleviate the distress. Miss Nightingale organised a staff of nurses, and proceeded with them to Constantinople to superintend the hospitals there. On January 6, 1855, conferences between the plenipotentiaries of England, France, Austria, and Russia, were opened at Vienna. Lord John Russell was the English plenipotentiary, and his conduct in supporting the propositions of France and Austria for the preservation of the integrity of the Turkish empire, and in the parliamentary discussion on July 6, and led to his succession from office on July 13. January 10, Sardinia joined the allies, and undertook to send troops to the Crimea. January 29, Mr. Roebuck's motion for a committee to investigate the causes of the sufferings of the army in the Crimea was carried against the ministry by 305 to 145. In consequence the Aberdeen ministry resigned, and on February 10 was succeeded by one of which Lord Palmerston was the Premier. March 2, the Emperor of Russia died, which was succeeded by his son Alexander II. May 24, Ketch cured by the allies, whose fleets swept the sea of Azof, and destroyed several towns and a vast number of vessels. June 18, the French attacked the Malakoff and the English the Redan, but were repulsed. July 15, a sudden assemblage of persons took place in Hyde Park to protest against Lord G. Grosvenor's Sunday Trading Bill, and some rioting occurred. The bill was withdrawn on the next day, but the meetings continued on the Sundays. July 11, Sweborg, in the Gulf of Finland, was bombarded by the allied fleets. August 14, the Metropolitan Local Management Act, constituting a representative board for the management of the improvements of the whole London sewage system, was passed. August 24, the French captured the Malakoff, and in the night the Russians evacuated the south side of Sebastopol, of which the allies took possession. September 29, the Russians assaulted Kars, and were repulsed by the Turks, assisted by Sir W. F. Williams, several other English officers, and General Emmet. Octo-
payment, one of them in a state of hopeless insolvency, accompanied with the disclosure of imprudent management in discounting an enormous amount of accommodation bills.

As early as October 8 the Bank of England raised its rate of discount to 6 per cent. and was increased on the 12th to 7 per cent., on the 19th to 8 per cent., on November 5 to 9 per cent., and on November 9 to 10 per cent. On the 18th the operation of Sir F. Peel's Bank Restriction Act was suspended for the second time, on the 23rd the Governor of the Bank gave it up to note issues to an amount not exceeding two millions, for which an Act of Indemnity was passed on December 19. This calmed the panic, confidence was restored, the rate of discount was lowered, to 6 per cent., the bullion in the bank increased from 6,666,000l. on November 11, 1857, to 17,617,283l. on March 3, 1858. The effects of the failures abroad, however, which had extended to Hamburg, and most other of the commercial towns of Europe, had a most calamitous influence on the manufacturing industry of the country.

On January 14, 1858, an atrocious attempt was made to assassinate the Emperor of the French, by casting explosive balls among the crowds he was seen to pass at the Champs-Élysées and Opera. The criminals, Orsini, Pérée, Rodic, and Gomez were apprehended; and on its appearing that they had recently left England, where each had resided for various but not very lengthened periods, an outcry was raised in Paris in aid of the claims of the English Government to a letter was sent by the French ambassador, which was published in the 'Moniteur,' complaining of the defective state of the law in England respecting conspiracy, and asserting that in England it was allowed openly to advocate regicide. Some fault being then assigned to Great Britain for having brought in a bill to remedy this asserted defect, which was ordered to be read a first time by a large majority; but on the motion for the second reading, Mr. Milnes-Gibson moved that the bill be sent to a committee of the whole house, was answered by the ministers, and the amendment was carried, on February 19, by a majority of 294 to 216. In consequence of this vote Lord Palmerston announced at the House on February 23, that the ministry had resigned: that the Earl of Derby had been sent for by the Crown, and that he had undertaken the formation of a new ministry. This was accomplished, and the ministry was completed, and met the Houses on the 12th of March. The new cabinet abandoned the conspiracy bill, but continued the prosecution of Dr. Bernard, for the asserted complicity in the conspiracy against the Emperor's life. He was indicted as accessory to the murder of one of the individuals who perished from the explosion of the grenade thrown at the Emperor on January 14, 1858. After a protracted and indeterminate trial, he was found guilty on the 20th of April, and sentenced to death by firing six days after. The capture of Canton, the war in China [China, S. 2] almost ceased; and since the reduction ofLucknow [Indian Empire, S. 2], the chief military operations have been the taking of detached forts or towns, and the pursuit and capture of isolated bands of insurgents. On the 16th of October the new Chancellor of the Exchequer (Mr. Disraeli) introduced his budget, in which he announced the reduction of the income tax to 5d. in the pound, the equalisation of the duty on Irish distilled spirits with that of England and Scotland, and the imposition of a penny stamp on every cheque issued for payment on a banker, all of which were subsequently agreed to. On April 12 the Oath Bill was again carried in the House of Commons, but was rejected in the Lords, so far as it disturbed the constitution. On April 16, another attack was made on the Government, Lord Cardwell introduced a motion of censure on the ministry for having made public a despatch from Lord Lombborough, as President of the Board of Control, to Viscount Canning, Governor-General of India, condemning the proclamation issued by him. Lord Cardwell then moved an amendment, disapproved of the publication, Lord Lombborough resigned, and after several nights' debate in the House of Commons the motion was withdrawn on May 21.

VICTORIA, or PORT PHILLIP, a British colony in Australia. Victoria is the southern extremity of the continent, extends between 34° and 39° 59', 141° and 150° E. long.; and is bounded N. and E. by New South Wales, from which it is divided by the river Murray, and a line passing through the islands of Lord Howe, King George, S. by Bass's Strait and the Pacific Ocean; and W. by South Australia, from which it is separated by the meridian of 141° E. long. The form of the province is triangular, its greatest length being from east to west about 800 miles; its
greatest breadth about 300 miles. The area is 88,000 square miles or nearly 63,000,000 acres. The population in 1846 was 32,500; on March 30, 1851 it was 77,345; on December 21, 1852, 192,637. In February, 1856, Bradshaw's "Monthly Guide to Victoria," gave the total population as 430,650, including 33,285 Chinese and 17,689 aborigines. In 1855 it was estimated that the population of the colony was 208,546, of whom 20,546 were Chinese; in this time of China there were 3 women, and 3 children.

From Cape Howe, at the eastern extremity of the province, a line of coast, called the Long Beach, extends 200 miles in a southerly direction. This part of the coast, which curves slightly inwards, consists for the most part of low and sandy shores backed by hills. Near the centre are several lagoons, and a considerable number of salt-water lakes. In the extreme north of Wilson's Promontory is a large inlet, called Alberton's Inlet, a narrow estuary which has been formed. The inlet is full of shoals, but it forms a harbour for small vessels, and maintains considerable intercourse with Hobart Town, exporting sheep and fat cattle from the adjoining country. Cape Nelson is a number of small rocky islands, forming a continuation of the ridge of the Australian Alps. From Wilson's Promontory to the western boundary of the province, the coast-line runs in a north-westly and westward direction, which arises from the entrance of the Swan River. Three small harbours are found on it—Portland Bay, near the western, and Port Phillip and Western Port, near the eastern extremity. Between Portland Bay and Port Phillip, a distance of more than 45 miles, there are no islands or shoals which present a danger to vessels, with the exception of Warrnambool and Port Fairy, small harbours for coastal vessels. During the summer the south-westerly winds blow on this coast for three months with great force. From Wilson's Promontory to Western Port the coast is mostly high. From Portland to the western boundary-line it is generally low. The low shores are sandy, except at some places where swamps exist. West of Cape Nelson the coast is bounded by sand-hills.

Clarence, Goulburn, and other rivers are peculiar to Australia; at other places it is covered with grass. The numerous hills are thickly wooded, and the best soil is found at their bases.

Of the western division of the province, which, for its beauty and apparent fertility, was called by Sir Thomas Mitchell, who first explored it, Australia Felix, the best portion is that which lies within the hilly tract on both sides of the watershed. Nearly all the ridges by which this tract is overtopped run nearly at right angles to the watershed. The most western of these ridges are the Grampians, a range of mountains, and has been called the Grampians. Nearly in the centre of the Grampians stands Mount Toor, or Mount William, which rises to 4800 feet above the sea-level. West of Mount Sturgeon is 1071 feet, in height. The Grampians are surrounded with extensive forests of fine tall timber-trees of Eucalyptus.

The country which is drained by the rivers originating in the southern and western portion of the Grampians appears to be the most fertile tract of New South Wales. It is abundantly watered by the Nangeela, or Glenelg, and its tributaries. The soil is black and rich, several feet deep, and rests on a subsoil of clay. The surface of the higher portion of this plain is strongly undulating, and on it are found many small and slow-flowing creeks. The hilly tract of the watershed east of the Grampians has its surface diversified by numerous narrow ridges of rocks, several round hills of moderate elevation, and many small narrow valleys traversed by clear and pure streams. In some parts the hills are covered with wood; at other places free from wood, but overgrown with grass to the top. About 30 miles east of the Grampians, some more elevated ridges traverse the watershed. They have been named Pyrenees, for the name of the French mountains. In other parts they are covered with granite, but are all grassy to their summits, and thinly wooded. East of the Pyrenees the country is more broken and the hills are higher. There are forests chiefly composed of eucalyptus and box, and a considerable portion of the hilly country, placed nearly in the north of the state, is covered with hills of lava. A very large portion of this hilly country affords excellent pasture.

Between the hilly region of the watershed on the south, the mountain region of the Australian Alps on the south-east, the course of the Murray on the north, and the boundary
line of South Australia on the west, lie the plains of the Murray River. The Murray and its tributary the Bayounga flow in wide bottoms, sometimes 8 or 10 miles across, which bottoms are overgrown by high trees, partly swampy or covered with lakes and ponds, and an extraordinary degree of fertility in the vigour of their vegetation. In some places are found salt lakes in considerable numbers, but in general the plains are open, grassy, and beautifully diversified with downs and wooded valleys. A considerable distance from the banks of the rivers water is not scarce, as there are numerous hollows in the plains, which generally contain water. The plains of the Murray are fit both for cultivation and rearing of cattle. The river Murray, rising in the Snowy Mountains south of the division along the boundary of the province, entering South Australia at 34° S. lat., after a course of above 600 miles. In the lower part of its course along the border it has a channel 360 yards broad and 30 feet deep of from 12 to 20 feet. Its chief tributaries, which drain the northern division of the colony, are the Mitta-Mitta, Ovens, Goulburn, Campaspe, and Loddon, most of which are dried up during summer and converted into chains of ponds. The Mitta-Mitta rises in the Australian Alps, not far from Lake Omeo, the neighbourhood of which forms one of the gold-fields of Victoria. The Loddon rises near Mount Alexander, the principal gold-field, and its feeders, after the rainy season, are employed in the collection of the gold-washing. The Avoca, Avon, and Wimmera flow northwards from the eastern side of the Grampians and Grampians chains. The Glenelg, collecting several tributaries from the western slopes of the Grampians, flows southward along the frontier, and enters South Australia just before reaching the ocean. The Yarra-Yarra, a considerable stream in Ferryns, which washes the capital, is subject to heavy floods during the rainy season. It comes in from the mountains to the east of Melbourne and continues in a very circuitous course to the sea. It is navigable for small vessels and steamers of light draught. The Latrobe, rising in the Great Swamp, which is divided from Western Port by a belt of land a few miles broad, intersects the southern range of the Alps and flows eastward through Gippsland into Lake Wellington. Lake King collects the waters of the Tambo, the Riley, and the M’Arthur, which drain the northern district of Gippsland.

The predominating rocks in the higher masses of the Australian Alps are granite and slate. The granite, quartz, intermingled occasionally with mica-schists and various other rocks of slaty texture. Quartz, ironstone, sandstone, and clay-slate are general throughout the other hilly portions of the colony. Very fine coal can be found on the coast between Port Phillip and Cape Otway, besides tin and manganese. Rich veins of copper ore have been met with on the banks of the Yarra-Yarra. The chief mineral however is gold, the discovery of which in 1851 has led to a remarkable increase in the wealth and population of the colony. The gold is chiefly found at Ballarat, 40 miles N.W. from Geelong; at Mount Alexander, 75 miles N.W. from Melbourne; and around Lake Omeo, in the Australian Alps. At Ballarat, where the precious metal is found extensively on the range, and in the bed of the river, a curious section of the workings exhibits the following series of strata:—Red ferruginous earth and gravel, streaked yellowish and red-clay, quartz gravels of moderate size, large quartz pebbles and boulders with masses of ironstone set in very compact clay, blue- and white-clay and pipe-clay. The gold is uniformly found in the formations superior in value to the clay. The richest deposits occur in the blue-clay, which is for the most part pure quartz. It is washed from the clay by water or by floating it in the beds and is sometimes found in fused pieces of pure metal, at others incorporated with quartz-pebbles, and occasionally in rolled water-worn lumps called nuggets. The quantity found has been enormous. The purest pieces and others to the diggings was at first productive of some interest, but the judicious establishment of a mounted police, and the imposition of a small tax for a licence to dig, reduced the system to great regularity in a short time. The amount of gold exported in 1855 was valued at 10,305,980£. In the early part of 1856 serious riots took place at the gold-diggings of Ballarat, in consequence of the miners resisting the payment of the licence fees. This led to the substitution of a tax on gold exported from the colony, instead of the licence fee for diggers.

Victoria is comparatively mild. The mean temperature of summer is 65°, of winter 48°, of the whole year 57°. The atmosphere is so dry and elastic that the bar of summer, sometimes very intense, is less oppressive than in many parts of Europe. Not unfrequent are sudden storms of snow, extending over 30 to 30 hours, suddenly raising the temperature to an extreme heat, but they do not occasion great inconvenience, and they are generally succeeded by a refreshing breeze from the sea. During June, July, and August, the winter months, the cold is not felt as severely as in other parts of the world. Snow falls in August, 1858, fell at Bendigo to the depth of seven feet. The average fall of rain for the year is 30-7 inches. The rapid changes of temperature, sometimes 30 degrees in 24 hours, are the most marked and consupptive patients. Dysentery and a species of opthalmia prevail to some extent in the hottest months. On the whole, the climate is found agreeable and salubrious. The wild animals found in the province are, the dingoe, or more dog; the great gray kangaroo, which abounds in some districts; the rock wallaby, or badger; kangaroo rat; oppossum; flying squirrel; wild cat; bandicoot; sloth, or Australian bear; and various others. Among its birds are, the buster or wild turkey, which on some of the plains appear in enormous herds. The lyre-bird, or Australian phasian, which frequents the mountains of Gippsland; black swans, which abound in the neighbourhood of Western Port; the emu; magpie; peahen; and many others. The larger animals are the wallaby, Musquitos, locusts, and ants appear in great numbers in summer, and also lizards and other reptiles. The bays and rivers abound with fish. Codfish of a large size are found in the rivers of the northern district. Shoals of herrings appear on the coast, and in the greater part of the sea. The important timber-trees are, the red-gum, lightwood, blackwood, pine, tea-tree, she-oak or sally, honey-suckle, and ironbark. The kangaroo apple-tree, the grass-tree, and the quandong are valued for their fruits. The fig, which is the most prolific tree, and the dates which have been successfully cultivated are, the peach, plum, quine, nectarine, apricot, pear, apple, mulberry, almond, and fig. Several vineyards have been formed. Vegetables are abundant. The potato, turnip, carrot, cabbage, broccoli, and radish, grow to an enormous size. Cabbage and flea are indigenous. The tobacco and castor-oil plants and Indian corn grow luxuriantly. The common cereals are produced in great perfection; wheat is of the finest quality, with a return of their heads of 50 to 60 bushels per acre.

The climate of Melbourne is equal to any part of Australia for the growth of wheat, Indian corn, and potatoes. In all parts of the colony there are tracts of the finest arable land. But sheep-farming is the principal pursuit in the province. The great bays and lagoons are the best roads for the export of wool has for some years very rapidly increased.

The settled part of the province, comprehending principally the eastern and southern portions, is divided into 34 counties. Melbourne, the capital of the colony, is described under Macaconnell, & c.; but we may add here that in 1834 the receipts were 650,864£, of which a great part was raised on loan; and the expenditure was 659,772£, of which 291,504£ were expended on public works in the city. There are 8 daily newspapers. The great hazy climate is very prejudicial to the health of the inhabitants. The papers published in the colony, the greater number of them in Melbourne. Most of them are of a large size, expensive; well printed, and some of them edited with great ability.

The second town in the colony is Geelong, now an important shipping port, pleasantly situated on the south-western shore of Port Phillip, at the head of Coria or Geelong Bay. It is regularly built, well supplied with water, and steadily advancing in population and trade. Smaller vessels enter the bay nightly, and nearly every country town has its representative in the town. Port Henry, 10 miles down the bay. The increase of the town of Geelong consequent on the gold discoveries is shown by the town revenue in 1851, 1853, and 1854, which was thus: 1851—2,974£. 4s. 1d.; 1853—10,997£. 16s. 1d.; 1854—11,341£. 14s. 6d. Geelong is now a large and important beginning of a railway at the north-eastern coast of Port Phillip, which is about 120 miles from Melbourne. The railway to Geelong has been constructed. Near the mouth of the Yarra on the north-eastern coast of Port Phillip, the nearest village
of St. Kilda and Brighton, which are resorted to as bathing places by the citizens of Melbourne.

The town of Portland is built near the western extremity of the bay of the same name. It has a small population, but occupies a considerable space, being built in streets crossing each other at right angles, and surrounded by some whaling establishments in the place, and the wool and other produce of the neighbouring districts are shipped at the harbour, which is inconvenient and exposed. 

Belfast, an active and thriving town, is situated on Port Fairy, some miles east from Portland, and is one of the most important of the large shipping and wool ports of Victoria. A Presbyterian church was opened here in the early part of 1855. 

Bellarine, the seat of the gold-diggers of that name, is described by Mr. William Howitt, who visited the place, as containing a large population, who are settling down into regular habits and are constructing a neat, well-laid out, and commodious town.

The principal towns in Victoria colony, in addition to those already mentioned, are—Alberton, Avoca, Ballan, Beecroft, Benalla, Bouverie, Braidwood, Carrum, Chepstow, Colac, Flemington, Kilmore, Keyneton, Mount Alexander, Port Fairy, Prahran, Richmond, Sandhurst, and Wangaratta. Bradshaw's 'Monthly Guide to Victoria' for January 1857, p. 205, gives a list of localities.

By an Act of the Legislative Council of Victoria, ratified by the Act of the Imperial Legislative Council, 18 & 19 Vict., cap. 55, it is provided that there shall be a Legislative Council of 30 members, and a Legislative Assembly of 60 members, for the term of five years, or until the next general election, as well as natural born subjects of the Queen, and possessors for at least one year previous to election of lands and tenements in the colony of the value of 500l., or of the annual value of 500l.

No judge, minister, tutor, or convicted felon, can be a member. The following subjects, or naturalised for at least three years, and possessed of freehold property of the clear value of 100l., or clear annual value of 100l., or leasehold property of 100l. yearly. Members of Parliament must be 21 years of age, possessing freehold property to the amount of 200l., or 300l. yearly value. Judges, ministers of religion, and persons who have been attainted for treason, or convicted of felony, are excluded. Electors must be 21 years of age, possessed of freehold property of the clear value of 100l., or occupy premises of 10l. yearly rent, or have a yearly salary of 100l.

After the expiration of two years from the passing of the Act 20 persons is to be appointed by the legislature to this new chamber. The leading feature of the new charters for Victoria and the other Australian colonies is that, with the exception of a few reserved points in reference to imperial rights, the business of each colony will be managed by its own legislature. In particular the management of the waste lands is committed to the colonial legislature.

The imperial authority is represented by a lieutenant-governor, whose salary is 10,000l. per annum, with an allowance of 6000l. per annum for salaries of staff, repairs to government-houses, travelling, and other expenses. The laws are administered by a chief justice and three puisne judges, who have criminal jurisdiction, and exercise the powers of the Queen's Bench, Common Pleas, and Exchequer courts. The assembly consists of 21 members, and the estimated expenditure in 1853 was 409,864l. 1s. 5d.; in 1853 it was 734,961l. 18s. 2d. The estimated income for 1855 was 3,015,683l., and the estimated expenditure 4,601,292l., showing a deficit of 1,585,609l., to provide for which a considerable amount of difficulty was experienced by the government. The estimate for the income, however, was exceeded by more than 100,000l., and the revenue, though in the year showing a considerable increase in the customs' duty, gave a large increase in the item of land sales, of 12,000l., on property near the town of Melbourne.

The number of ships entered at the ports of the colony in 1851 was 712, of 129,426 tons; the number in 1852 was 1657, of 408,316 tons. The number of ships registered as belonging to the colony on December 31st 1854 was 272 of 1,177,376 tons. The value of the goods imported into the colony in 1851 amounted to 1,425,964l.; in 1852 the amount was 7,451,549l.

From Great Britain alone there was sent to the colony in 1853 goods to the (declared) value of 7,029,526l. of British produce and manufactures. The value of the British wool re-exports and the world's foreign and colonial produce and manufactures.

About 21,000,000 lbs. of wool was imported into Great Britain from Victoria colony in 1853. In 1854 the imports had risen to 17,638,051l., but sunk to 12,907,926l. in 1855; while the exports had risen in the two years from 11,777,304l. to 12,493,383l. The imports again decreased in 1856 and 1857.

Port Phillip was discovered and entered by Lieutenant John Murray in January 1802, and was soon after visited by Captain Flinders, who called it Port Phillip, in honour of the first governor of New South Wales. Although occasionally visited in succeeding years, it remained without any settlement until 1839, when the directors of the Sydney Company established a settlement there, and took place in the Australian colonies. A settler from Van Diemen's Land having purchased an extensive tract of country from the natives, the government refused to recognise the validity of the purchase, and the entire district adjoining Port Phillip was purchased by the natives of Van Diemen's Land, bringing their flocks with them, arrived in great numbers. The New South Wales squatters, with their flocks and herds, came from the north. The district rapidly advanced in population and wealth, and was annexed to New South Wales in 1826, and was the governor of New South Wales, till, after repeated representations on the subject, it was, in 1850, separated from that colony, and constituted a distinct province. The bishopric of Melbourne was founded in 1847; the diocese comprises the colony of Victoria. There is one archdeacon, of Geelong.

VICTORIA. [Hono Kono, S. 1.]

VICTORIA REGIA, a species of the natural order Nymphaeae. [NympHAEACEI.] This splendid plant, in the original dimensions of the flower and the brilliant color and fragrance of its flowers, may deservedly be called the queen of flowers. The following is the account of its discovery by Sir Robert Schomburgk:—"It was on the 1st of February, 1854, that Sir Robert Schomburgk returned to the Equator from the northern parts of Brazil, and his companion, Captain Fagoaga, arrived at the mouth of the Rio Negro, opposite to an island, which was inhabited by the negroes, and which is called Guiana. The river is about ½ mile broad, and was filled with passengers on board a large native canoe. The bank at the mouth was covered with blossom, and as I rowed from one to the other I always observed something new to admire." The leaves are very large, measuring five or six feet in diameter. They have an orbicular form, the upper surface in bright green, and are furnished with a rim round the margin from 3 to 5 inches in height; on the inside the rim has a green colour, and on the outside, like the under surface of the leaf, it is protected by a bright red. The flower, which has a rather large petal, is about an inch high, radiating from a common centre; these are crossed by a membrane, giving the whole the appearance of a spider's web; the whole leaf is beset with prickles, and when young is convoluted. The stock of the flower is an inch thick; the petals with prickles, each sepal is 7 inches in length and 4 inches broad; the corolla covers the calyx with hundreds of petals; when first opened it is of a white colour, but subsequently changes to...
VIDOCQ, FRANÇOIS-JULES, the chief of the detective
brigade (Brigade de Sécurité), at the prefecture of the Paris
police, established in 1819, whatever must be thought of his
early life as a thief and inmate of the convict yards, un-
doubtedly did real service to France, by his active pursuit of
the marauders who levy contributions on their neighbours’
goods. He was born at Arras, the chief town in the depart-
ment of the Pas de Calais on the 23rd of July 1776. His
father was a baker, and was chosen to supply the local
government, during the revolution, with bread, flour, &c.
Young François was employed in the business before he was
thirteen; but formed acquaintance who led him to partake
his father’s money by means of several artful contrivances.
These being detected, the boy began to pilfer the stock,
spending the proceeds with his companions at a neighbour-
ing wine shop. A watch was at length set over him; which
did not prevent his stealing ten silver forks and spoons, and
pledging them. For this offence his father gave him in
charge, when he was sent to the House of Correction for a
few days. While in confinement he was incited by a young
fellow-prisoner to rob his father again, by picking the lock of
the till, and taking out the whole contents, amounting to
800. Having divided this money with his accomplice, he
left Arras, intending to sail for the United States; but
the high price of the passage made him change his mind; and
being at Ostend a few days after, he was plundered by a
sharper of all his ill-gotten gains.
In this state of destitution, he hired himself to an itinerant
showman, who kept a small menagerie. His allotted task
consisted at first in sweeping out the cage and the reception
room. His master, after promoting him to the rank of
tumbler and acrobat, wanted him to play the part of a savage
who eats raw flesh and drinks blood. The wretched boy
refused to undertake this new character, and was discharged.
He next took service with the master of a puppet show; from
whom he passed into the hands of a peregrinating
quack-doctor. At length weary of this hard probation of
vagrant life, which had lasted two years, the seeming pen-
iten returned home, and a kind old priest prevailed on his
father to forgive him and receive him. This was in 1793,
in his sixteenth year.
But he was too idle and restless for regular work; so he
enlisted (after one or two escapades), in the regiment of
Bourbon, and set out for Belgium, then the seat of the new
war, between France and Austria. He was present in
several actions, and was made a corporal; but, having
quarrelled with his drum-major, and challenged him to fight,
he deserted to avoid a court martial. He then enlisted in
the 11th chasseurs, and fought at the battle of Jena, on
November 6, 1792. Having distinguished himself at the
capture of Longrivy, under Kellermann, October 20, 1799, and
being of unusual stature for his age, he was made a corpo-
ral of grenadiers. A day or two after he was recognized
as a deserter, when he made his escape to the Austrian
outposts. Unwilling however to fight against his own
countrymen, he counterfeited illness, and began to teach
fencing.
After a short stay with the Austrians, he got back to
France, entered the 14th regiment, and then returned to the
11th, being present at several actions, and being wounded
twice. One of his wounds obliged him to return to
Arras, where in consequence of a quarrel he was denounced
to the Revolutionary Tribunal as a ‘Moderé,’ and thrown into
prison. However he was soon after released, owing to the
good offices of Mademoiselle Chevalier, the daughter of the
notorious Joseph Lebon. He married her in 1793, but
they separated almost immediately. The next year he went
to Brussels, became a professed gambler, made love to a
countess under a feigned name, and repenting of his treachery or
fearing punishment for bigamy, just as he was about being
married to her, confessed the imposture, was rewarded with
a considerable sum of money, and took the diligence for
Paris, which he entered for the first time in 1796, at the age
of twenty-one.
He had not been in the capital many weeks, before the
dangerous society of gamblers, swindlers, and love women,
left him once more penniless; which compelled him to return
to the army of the north. Several fresh instances of folly,
three imprisonments, and as many escapes, succeeded; after
this he was confined in the prison of Douai, where he
remained eight months. During his confinement, he was
mixed up in a case of forgery, which in his autobiography he
tries to explain as an act of inadvertence, rather than of
guilt. For this however he was tried, convicted, and sen-
tenced to eight years’ penal servitude at the galleys. As
they conducted him, bound to the chain, he excited a revolt
among the convicts, but the attempt to escape having failed,
he reached Brest, and remained six years at the barge. In
this place he completed his studies of the manners, the
crafts, the habits, of every class of thief. Two years before
the expiration of his penalty, he contrived to escape from the
convict-yard, assumed the name of Duval, and returned to
his own neighbourhood, where he became an usher to a
school at Ambricourt, near Lille. He was soon re-captured,
and sent to Toulon. From this convict-yard, he then made
what he calls “his finest escape.” After this he joined a
band of freebooters in the south, who plundered the stage-
coaches on the highroads. But these malfactors having
detected the brand of the convict on his shoulder, disarmed
him from their company, having first made him swear not to
betray them. He resolved to be revenged; and this incident became the turning-point in his fortune.

As he was making for the north, Vidocq, having no passport, was arrested and taken before a magistraté, to whom he offered to give such intelligence as would enable him to surround his late comrade, but only to the extent of plagues. For this purpose, he applied for a temporary release. But the magistraté demurred. "Suppose, on my way to prison," said Vidocq, "I get away from my keepers, come back to you, and resume my bondage, will you then grant me the provision of a passport?" The magistraté shrugged his shoulders in a manner which would seem to intimate that he had no cause to fear. He escaped, and made good his offers to assist justice. This service was followed by others far more considerable. These events took place in 1804, but he continued for several years the reputation of the great wire-puller. In 1806, again, when he maintained himself by following the handicrafts which he had learned during the course of his nomadic life. He became a toy manufacturer, a dealer in hardware, and a tailor; but other thieves, who had known him in prison, and who were well acquainted with his embarrassments, left him no peace; sometimes they wanted money, at others they proposed a good bargain; next it was some plunder to be had. On one occasion they borrowed his cart, to convey the body of a murdered victim to a place of safety. He tried to follow them, but they were too quick for him.

In 1809, driven to extremity, Vidocq presented himself before M. Henri, the commissioner of the secret police of Paris. He acknowledged his condition, and offered to give various services which he might be called upon to perform, and go freely. This proposal was not accepted until his solicitations had been several times renewed, in the midst of which he was once more arrested. On this occasion he was sent to Bicêtre, when M. Henri, interested by his perseverance and, at times, by his adventure; besides that spirit of sang and bant, which is the eloquence of the vulgar, he made it a point, from the outset of his new vocation, to produce at once the culprit and the proofs of his crime. The receivers of stolen goods found in him a more relentless enemy than those whom he had formerly attempted to rob, and the regular police officers; but in 1813 he was withdrawn from their control, and placed under the order of M. Henri alone. His captures were extraordinary. The famous thief Belleville, and Follaré, the robber who afterwards stole much more than 15,000 with the help of the subfusc at the latter's, was handed over by this secret agent to justice. La Courtois, a sort of St. Giles's, infested with the worst vagabonds, was purged; the great burglar, Desnoyers, and thirty-two of his accomplices, were taken. About the same time, the famous brigade of detective police (Brigade de Sûreté), directed by Vidocq, was formed, consisting at first only of four men; in 1817 the number rose to twelve; and in 1824, when its complement was full, it contained twenty-eight detectives. "It was this minute force," says Vidocq, "that I had to watch and look after 1900 returned transportes, and issue every year from four to five hundred writs."

In the single year 1817, he effected 773 arrests, and 32 seizures of stolen goods. His useful work attracted the notice of the Minister of Police, and of which he was notified by the Secretary of 2002. During the whole term of his official employment, he was the butt of continual charges, suspicions, and open accusations. He was said to take part in every crime, to incite robberies for the sake of arresting his dupes, and of those who shared in the plunder. This obloquy rose so high as to alarm the government, and in 1825 he was superseded in his functions by Lacour, whose antecedents resembled his own. In 1826 he established a paper 201 factory at Saint-Mandé; and in 1827 he moved to the United States, and conducted a paper mill in Paris, by the bookseller Tenon, in 1829, in 4 vols. In 1831-32 he was employed to detect some of the political agitators of the day, but his vocation was not either permanent or lucrative. In 1838 he handed over his information on behalf of Trade and Commerce, the object being to enable the fair trader, when applied to for credit, to ascertain the degree of trust to which his new customer was entitled.

In 1844, stimulated by the success of Eugène Sue's Mysteries at Paris, and certain works of the same questionnable character, which had appeared in London, he republished his Mémoires, under the title of 'Les Vrais Mystères de Paris.' The morbid taste for notoriety of any kind which then prevailed, and the name of Vidocq, which had exhibited himself, with many curious articles used by French burglars, in the rooms of the Cosmorama in Regent Street. But this speculation did not answer his expectations. Soon after he fixed himself in Belgium, where he died in 1850.

VINET, ALEXANDRE-RODOLPHE, was born at Lausanne on the 17th of June 1797. His father, who held an official appointment in his native canton, a man of moderate property, and of that stern disciplinarian, was himself Alexandre's earliest instructor. In his youth, his studies were chiefly directed to theology, he having been devoted to the service of the church; but then, as throughout life, literature possessed for him a predominant attraction, and so diligently had he laboured in this field, that at the age of twenty he was appointed professor of the French language and literature at the gymnasium of Basel. Two years later, 1819, he was ordained at Lausanne a minister of the protestant church, and the same year he married; in 1823 he resigned his connection with this movement and with the proceedings of those opposed to it, he published in 1826 an elaborate Mémoire en faveur de la Liberté des Cultes, and he gradually came to be regarded as one of the leaders of the evangelical party.

M. Vinet remained at Basle, and for several years M. Vinet was one of its chief contributors; and in 1837 he published a selection of his essays contributed to it, with other missellaries, under the title of Essais de Philosophie Morale. In 1837 Vinet was invited by the authorities to take the chair of the lectures on the history of the native city of Lausanne, and, with some regret at leaving Basel, he accepted the invitation. The religious discussions in the canton had decided the government to appoint a commission, who were to draw up a new constitution of the church, and M. Vinet was elected a delegate for the class of Lausanne and Vévey. He took part in all the protracted discussions which followed, but he could not bring himself to acquiesce in the decisions of the majority, and, accordingly, upon the promulgation of the new constitution which was to come into operation in 1841, he, at the end of 1840, formally seceded from the national church, and resigned his professorship of theology. His opinions had in fact from the publication of his Mémoire en faveur de la Liberté des Cultes in 1826, been approximating more and more closely towards 'voluntarism,' and from this time he became a decided, and, among French Protestants, perhaps the most distinguished advocate of the fact. His work was translated into English in 1843 under the title of An Essay on the Profession of Personal Religious Conviction, and upon the Separation of Church and State, considered with reference to the Fulfilment of that Duty. But, as Vinet was far from being the barbels who, by the adhesion of a whole class of notaries adhering to his own views, he exhibited to a wide tolerance of the honest convictions of others, and his later years were spent in preaching peace and brotherly love, and seeking by the amendment of literature to soften the asperities of theological controversy.

His last labour was the elaboration of a constitution for the Free Church of the canton of Vaud, formed by the ministers
who seceded from the establishment in 1845, and which he induced the committee appointed by the Church in 1846 to prepare the constitution, to adopt in its integrity. With the Synod however, in which the ultimate adoption of the constitution was vested, he was less successful, and the manuscript of his book, "Lettres," whose preface was severely on his frame, already enfeebled by protracted ill-health. He continued however with increased diligence his professional duties and literary studies till his powers gave out; he died on the 10th of May 1847.

A list of the chief works, not already mentioned, of M. Vinet, will sufficiently indicate the character of his mind and the range of his pursuits. Among his theological works may be named his "Discours sur quelques sujets religieux," a discourse delivered at a funeral sermon in 1845, and "Nouveaux Discours, &c." (1841), from which two works selections have been translated into English and published in America and Edinburgh under the title of "Vital Christianity," and the posthumous publications "Théologie Pastorale," and "Hémiplégie ou Théorie de la Prédestination," of both of which English versions have appeared; "Liberdres religieuse et Questions ecclésiastiques," "Études sur Blaise Pascal," "Études Evangeliques," and "Nouvelles Études Evangeliques," which have been rendered into English as "Gospel Studies." His two chief literary works are his "Histoire de la Littérature Française au XVIIIe Siècle," 2 vols., which appeared in an English version in 1854, and "Études sur la Littérature Française du XVIIe Siècle," 3 vols.; 1, "De Stael et Chateaubriand;" 2, "Poètes Lyriques et Dramatiques;" 3, "Poètes et Proseurs." All these works are accurate reflections of the mind and character of the author. Pure in sentiment, evident in purpose, clear and direct in style, brilliant rather than profound in thought; and everywhere pervaded by an earnest and conscientious spirit, they are works which will be read with pleasure and respect even by those who differ widely from their opinions. As a preacher, M. Vinet bore a high character for eloquence and earnestness; and as a teacher, he greatly increased the reputation of the schools of Basel and Lausanne, while his personal character was in every way admirable.

VIFER'S GRASS [SCHRÖNHA, S. 2.]

VISCONTI, LOUIS JOACHIM, son of Ennio Quirino Visconti, was born at Rome in 1797. His father was compelled at the close of 1799 [Visconti, E. Q.] to remove with his family from Rome, where the young Visconti was care fully educated. Having selected agriculture as his avocation, his father, as soon as he was of sufficient age, placed him with the architect Percier [PERCIER, CHARLES, S. 1], so well known by his works on the Louvre, a building with the parts of which he was identified, and much of it is still associated. Under Percier, Visconti made a distinguished progress, carrying off at the Architectural School five medals, and a second prize for the plan of a library. Shortly after the termination of his studies, he obtained an appointment as inspector of public buildings; and subsequently that of architect and surveyor of the third and eighth arrondissements of Paris, an office he held for above a quarter of a century. He was further, in 1825, appointed architect of the Emperor and he then devoted himself to less than twenty-nine plans and elevations in the hope of being directed to give to that building an architectural character equal to the grandeur of its contents, but his ambition was not gratified. Although not called upon to construct any important edifice, M. Visconti found ample employment in connection with the offices he held; and to him was entrusted some of the public monuments with which Paris has of late years been adorned. Several of the finest works are among his, as, for example, the Place Louvois, Gaillon, and Mollière, were executed from his designs. The tomb of Napoleon I. is also by him, and is his grandest work of the kind, but he also designed the monuments of Marshals Soult, St. Cyr, Suchet, Lauriston, and those of the eminent officers of Napoleonic times. He was likewise called upon to design innumerable triumphal arches and other temporary structures for fêtes and occasions of public rejoicings and ceremonies, and his taste and fertility of invention were generally admired. He also designed several hotels and private residences. But the work with which his name will be most permanently connected is, perhaps, the completion of the Louvre, and its connection with the Tuileries. The Emperor Napoleon III. having decided on completing this the most magnificent of the sacred edifices, he was directed to prepare the necessary plans, and these having met with the emperor's approval, the first stone of the new works was laid on the 25th of July 1852. The operations were pressed forward with the greatest vigour; but Visconti, who was appointed to succeed him, and on the 14th of August, 1857, the vast undertaking was declared finished, and the junction of the Louvre and the Tuileries was inaugurated with great pomp by the Emperor.

VITALITY, a term equivalent to vital life, and applied to the properties of those bodies, fast, living, which are of life in plants and animals. Life in animals is defined the three kingdoms of nature as follows:—Minerals grow; Plants grow and live; Animals grow, live, and feel. Here the fact of living is made distinct from the fact of growth, and the latter is naturally made for a definition of life. It is often assumed to be a set of actions under the controlling influence of a vital principle, but, as such a principle has never been demonstrated, it must only be regarded as an assumed cause.

Some writers have supposed that all the phenomena of life may be resolved into the action of chemical and physical forces acting upon special forms of matter, and that in plants and animals are presented the results of chemical and physical processes in which the living bodies, or minerals. Coleridge, in his 'Ideas of Life,' contends that the collective activities of the mineral universe is, as much a life, and its parts as much entitled to be regarded as living, as a plant in its special organs.

Setting aside however, the idea of a vital principle, or confining this term to the forces which regulate and produces the specific form in each individual animal or plant, and which is then applicable as well to minerals, there are a certain set of phenomena in plants and animals which it is impossible to be reconciled. This term may be thus applied without in any manner assuming the existence of any force independent of those which are known to influence all matter upon the surface of the earth.

This term has been thus far, however, only regarded as a vital process; also the contrivability of the muscular tissue, and the sensibility of the nervous tissue. These processes are called collectively Vital Processes. The force by which cells grow has been called the Organising Force, the Plastic Force, the Assembling Property, and the Metabolic Property. The contrivability of the muscles has been properly called Muscle-Force, whilst the sensibility of the nerves has been called Nerve-Force.

The physical force dependent on Physical forces is seen in the fact that plant-cells will not grow without light. Muscle-force and nerve-force are not producible but by the assimilation of materials that have been formed by chemical actions produced by heat and light.

The natural philosopher has demonstrated that electricity, galvanism, and magnetism, are different manifestations of the same force. He has rendered it probable that motion, heat, light, and chemical affinity, are also convertible forces. It is not impossible that this may be the case. But he has rendered it probable that, with regard to muscle-force and nerve-force, they are but differentiations or other manifestations of the physical forces. Muscle-force and nerve-force depend upon the destruction (chemical change) of cells which is produced by the heat and light; and the sensitiveness of men, as affected by the influence of heat and light, is produced by the carbonic and ammonia supplied to the cell of the plant. A certain amount of protein is the expression of a certain amount of chemical change, and this again in decomposition is the
expression or the amount of vital force, which a part composed of protein will exhibit. Vital phenomena are found to have the power of making certain changes and result in one or other of the physical forces. This view of the nature of vitality does not lead to materialism, as the consciousness of man, exists independently of the physical changes which go on in his body, and the character of his mind is essential to the ever-active changes which go on in his body through the agency of the vital forces. [Muscles, nerves and nervous system; motions of plants; vegetables, vegetable kingdom.]

VIVIANACEAE, Vivianites, a natural order of Exogenous Plants with free stamens, no disc, albinous seeds, a curved embryo, permanent petals, and a ribbed calyx. The species are herbaceous or half-shrubby plants, with opposite or whorled leaves, without stipules. They are related to Tirosaccus and Troposaccus. All the species inhabit Chili and South Brazil. There are 4 genera and 16 species.

Mr. Busk and Professor Williams, in the first volume of the new series of the ‘Microscopical Society’s Transactions,’ have furnished in great detail an account of the development of these curiously organised granules. From their observations, it appears that the green ciliated granules which stud the surface of the Volvox are produced from a central embryonic mass of which the outer wall of the granule is constituted. The deep green colour of the contents of these stellate embryos, and their subsequent changes into an orange colour, at once point out their close analogy with those of V. aureus. I have no doubt of their being merely modifications of the latter; and in fact the two forms are very frequently to be met with interspersed, and on several occasions I have observed smooth and stellate globules in the interior of one and the same parent globule.

The other globule, described and named by Ehrenberg, under the name of Sphaerostoma Volvax, also presents the appearance of a transparent globe set with green spots, but it differs from the foregoing in two important respects:

1. In the absence of any internal globules or embryos.
2. In the irregular size of the green granules lining the wall, which, instead of being of a uniform size, are of various dimensions.

Mr. Busk and Professor Williams, in the first volume of the new series of the Microscopical Society’s Transactions, have furnished in great detail an account of the development of these curiously organised granules. slow and gradual. This contraction of vascular spores has ever been observed by Cohn in a species of \textit{Protococcus}.

Mr. Booth sums up the result of his observations upon \textit{Volvoc glabrer}:

1. That it originates in an apparently nucleated discoid cell, which is generated in the interior of the parent, and liberated in a perfect though not fully matured form, within which are contained similar germ-spores. Just as

2. That the contents of this apparently nucleated discoid cell, consisting of a granular material, and refractive amorphous forms, after a time undergo segmentation, at the same time exhibiting a distinct wall, beyond which is a delicate annulus, apparently of a granular consistence.

3. That this segmentation, attended with a corresponding augmentation in the number of the refractive spherules, terminates ultimately in the formation of numerous conglutinate particles or segments.

4. That these segments are gradually separated from each other, remaining connected only by elongated processes or filaments, and constituting the ciliated zoospores of the mature Volvox.

5. That these zoospores at first are simple masses of protoplasm, containing a transparent nuclear body, and that afterwards they present for a time clear circular spaces, which contract rhythmically at regular intervals; and are subsequently furnished with a brown eye-spot; and at a very early period undergo segmentation, which is continued upon an elongated hyaline beam penetrating the parent cell-wall, and exert active movements external to it.

6. That in a concentric plane internal to these ciliated zoospores, is placed the germ of future individuals destined to follow the same line.

VOROSMARTY, MIHÁLY or MICHAEL, an eminent Hungarian poet and prose writer, was born at Nyír, in the county of Fejérvar, called by the Germans Stathweisensee, in the year 1800. His father, whom he lost early, was stewart to a nobleman. Michael went in 1817 to Pesth to study law, and in 1824 he was admitted as an advocate, but he early adopted literature as a profession. In 1821 appeared his first drama, 'King Solomon,' founded on the History of King Solomon of Hungary, and in 1824 another drama, 'Nothing Sigismund,' between which, in 1822, was published his romantic poem of the 'Triumph of Fidelity.' It was as an epic poet that he attained the greatest celebrity; his 'Zalan Füzes,' or Flight of Zalan, his 'Cserhalom,' and his 'Tündervölgy,' or Enchanted Valley, the first published in 1824 and the last in 1827, are considered the finest narrative poems in the Hungarian language.

For some years Vörösmarty was editor of the 'Tudományos Gyülekez,' or Repository of Science, a monthly magazine, which lasted under his guidance and that of others for a quarter of a century, and was during its continuance the chief organ of Hungarian periodical literature.

He was much concerned with Bajza and Schedel in the editorship of the 'Atheneum,' a periodical not unlike the London 'Atheneum,' which had for a time great and deserved success. In 1830, on the establishment of the Hungarian Academy at Pesth, he was appointed one of its members, and soon afterwards its secretary, and for some years his life flowed in an unbroken course of literary labours and literary studies. General his reputation is good higher among the educated classes than among the people; but one of his lyric poems, the 'Szózat,' or Appeal, written in 1840, enjoyed a double success; it rose at once to a strong popularity among the people, like that of the 'Marcellina' in France, and the Hungarian Academy presented the poet with a ducat for every line. Some of the lines of the 'Szózat,' the subject of which is the fate and prospects of the Hungarian nation, have since acquired a melancholy increase of significance:

'For some there will be, and some there must,
To us a better time.
And if it come not, then come Death To end our dark career.
And be our country, drowned in blood,
Laid on a glorious bier.'

It was natural that at the outbreak of the revolution in 1848 the poet of the 'Szózat' should be called on to take a part, and he was elected deputy for the county of Bacska. His course in the Assembly however was far from meeting the approval of some of the more fiery patriots. The pepeis and impetuous Petőfi, the Hungarian Burns, was so indignant at one of Vörösmarty's views that in a poetical address to him he remonstrated with him. The triumph of the Austrians Vörösmarty was brought to trial, and condemned as a member of some of the revolutionary committees, but was released and pardoned after a short time. He was, however, an exile for twenty years by the calamities of his country, that he sunk into a deep melancholy, and lived for two or three years in retirement, without suffering pen and paper to come in his sight. At length, in 1864, his friends roused him in some degree from this state of depression, and he undertook a translation of Shakspeare, some of whose plays he had rendered into Hungarian in happier days. The task was still not completed when Vörösmarty died at Pesth, on the 9th of November 1856.

An edition of the works of Vörösmarty was issued by his friends Bajza and Schedel as part of the collection of the Hungarian classics, entitled the 'Nemzeti Könyvtár;' or National Library. It was published in 1847. The division adopted for the writings are Lyric Poetry, Narrative Poetry, Dramas, More Recent Poetry, Novellas and Tales, and Miscellaneous Writings in Prose, which are subdivided into Essays on Language and Literature, and Dramatic Criticisms. The whole are comprised in one thick octavo volume, printed in six columns, but would occupy nine or ten ordinary octavos. Vörösmarty's writings are more distinguished for classical correctness of form than for striking originality of substance. His narrative poems are written in hexameters and the classical model, for which the Hungarian is perhaps better adapted than any other modern language. His lyric, as well as his epic poetry is estimated at a high value by native critics; but the very qualities that excite their admiration render their beauties difficult of transfer.
directors, were averse to the project. But in October 1839

by any European. The population of the colony was esti-

ated in 1836 at 366,100, of whom 147,081 were males.

Surface, Climate, etc.—The climate of this country is very peculiar. The interior consists of wide

plains, interrupted only by comparatively short ranges of

high hills or low mountains. The waters collected in these

plains are at first of a cloudy appearance, and embogues within the territories of South Australia.

On the east and south the plains are surrounded by higher land, which constitutes the watershed between the rivers joining the Murray and those which run into the sea. This waters-

hed is in general about 100 miles wide.

The Australian Alps commence at Wilson's Promontory, and extend into New South Wales by Mount Wellington.

In this range rise the Murray and the numerous streams which, flowing southwards, become confluent and form it into a river, having abundance of water all the year round, whilst most of the large rivers which run into the interior become dry during the summer months. Further

north, in the Warrangong Chain, the Murrayumble and its affluents takes its source, and is likewise a personal river; and east and north of this are Yass Plains and the hilly tract including Lake George. The elevated plains extend, under the name of Oolbourn and Breadalbane Plains, about 40 miles farther to the east, and Honechurch, which is the De-

doon Range, which constitutes the southern part of the Blue Mountains, east of which runs the Shoalhaven river to the sea. The Blue Mountains commence in 34° 30' S. lat., and run northward to the Monondulla Range, in 32° 40' S. lat. From this range the side descends to the Wollondilly and the Macdonald rivers, all of which find their way to the sea through the Hawkesbury at Bullen

Bay; on the west side descends the Lachlan and its affluents, which join the Murryumble. The mountains are of sandstone, except the northwestern part, which

attains a height of 3400 feet above the flat country. At the distance of 80 to 70 miles north of the Monondulla Range is the Liverpool Range, running east and west. This-range extends to 100° 30' E. latitude, and the northeastern part of Liverpool Plains, between 150° and 151° E. long. In these parts its southern slope rises with a precipitous acclivity, and in some places nearly perpendicular above the plains which lie south of it. Its elevation is probably 1500 or 2000 feet above the base. Where the slope is not too rapid it is thinly wooded. On account of the steepness of the ascent, only two places have been found at which it can be traversed with ease: the western called Pandora Pass, near 150° E. long; and the eastern called the Murray, which dis

101° E. long. When the summit of the passes is attained, a short descent brings the traveller to the Liverpool Plains. A ridge from the Monondulla Range to these mountains divides the affluents of Oolbourn River, a tributary of the Shoalhaven, into the Hunter and the Colo. The latter

passes through Cudgegong and Talbragar, which fall into the Macquarie. A considerable portion of this ridge is without trees, overgrown with bushes, and grassy; but on the rising grounds are forests composed mostly of apple trees, iron-bark, stringybark, and box.

The coast-line on the east extends in a general direction of north-north-east from Cape Howe to Cape Byron, when it recedes a little to the west. There are numerous harbours formed by the mouths of rivers flowing into the Pacific. The chief of these, proceeding from south to north, are—Twofold Bay, at the mouth of the Towamba, immedi

ately north of Cape Green, one of the boldst promontories along the coast; Barooga, Bateman Bay, Sussex Haven, Port Nepean, Port Hacking, Port Jackson, Broken Bay, Port Hunter, Port Stephens, Farquhar and Harrington Inlet at the mouths of the Manning and Landsdowne rivers, Port Macquarie, Trial Bay, Brisbane Bay at the mouth of the Clarence River, in 28° 0' S. lat. whereas the coast turns south and west, passing with its group of islands extending 70 miles from north to south. In this extent the shore presents every variety of appearance. From Cape Green to Shoalhaven River the cliffs are usually perpendicular, but generally low; the latter, in 10° 0' S. lat., to Hunter River, north of 35° S. lat., they present a range of bold perpendicular cliffs of sandstone lying in horizontal strata, occasionally interrupted by sandy beaches, the high land retiring to a considerable distance. Numerous sand-hills occur along the remaining part of the coast. Port

Stephens is a bar-harbour, so that small vessels only can enter it; those of larger description are compelled to anchor
outside. In some parts especially north of Trial Bay (26° 50' S. lat.) and south of the mouth of Clarence River, are tracts of coast many miles in length, where it is rocky and irregular, and of considerable elevation. The brooks are only found at the mouths of the numerous rivers.

_**Rivers.**—The larger rivers which drain the country between the Pacific and the watershed have water all the year round. They generally flow in beds which are deeply depressed, and which are bridged by country-level in the direction of the river. There are several small streams, however, which, though narrow, are navigable for small boats. The Shoalhaven River, the most southerly of the considerable rivers of this region, rises on the table-lands east of the Warragong Mountains, and runs about 90 miles northward, measured in a straight line, and then about 40 miles eastward. About 100 miles north from the mouth this river is very rapid, up to which the tide flows. The mouth of the river is much obstructed by shoals and sand-banks. The Hawkesbury falls into Broken Bay. It rises under the name of Wollondilly, on the connecting table-lands, and receives nearly all the waters which are collected on them. It flows into a deep bed, sinking into a deep ravine, when it is no longer accessible. The last rapid occurs near Windsor, from which place it is navigable for moderate vessels. With the shoal, it rises in the direction of the coast from the mouth of the river, and at about 100 miles at least following the windings of the river, whose waters are fresh for 30 miles below the town. Its estuary, Broken Bay, is surrounded by rocks, and has several good anchorages even for large vessels, the best of which is called Pittwater, lying between the headlands of East and West Pittwater, in the straits of Pittwater, and extending to the head of the bay. Sometimes the floods of this river rise to 90 feet above its usual level, and the inundations then lay waste the fertile tracts on its banks. _George's River_ falls into Botany Bay. It runs hardly 60 miles, but is navigable for boats from Liverpool, downwards, a distance of about 12 miles in a direct line, but 24 miles following the windings of its course. _Hunter River_ disembogues into Port Hunter. It has two great branches, one called Hunter and the other_ Macleay River, _which rises in the Highlands, the other in the connecting ridge, and both have very tortuous courses. The navigation begins at Maitland, about 20 miles from Port Hunter by land, but nearly 40 miles by water, and a steamboat plies regularly between that town and Sydney. This river often rises rapidly after heavy rains, and in some places to the height of 80 feet.

The navigable rivers which drain the countries north of the Hunter are the Manning, Hastings, Apeley, Clarence, and Murray. The Murray, which is 240 miles long, flows virtually into Port Macquarie, which is a bar-harbour, admitting only vessels of 100 tons burden; and it is dangerous to enter, except at full tide, on account of the swift current, which sets from the land. The bar is formed by shoals on the northern side of its entrance. Outside the bar is a sand-bank for about 12 miles, and the summit of the largest cricket, except when the wind blows strong on the shore. Within the bar is secure anchorage for a great number of vessels.

North of Port Macquarie is the valley which is drained by the Apeley or Mac Leay River, which divides about 12 miles from the sea into two branches, inclosing a large island. The main branch at the northern end forms the harbour of Trial Bay, which has a bar across, having from 19 to 17 feet of water upon it. This river is navigable to a distance of more than 50 miles from the sea, when farther progress is impeded by a fall, which occurs where the river issues from a narrow glen, whose sides rise 900 feet above its bed. Below this place the river runs through a wide valley, in which there are some plains destitute of timber, and gently-rising hills covered with opening forests and grassy pastures. Farther north is the valley of the Clarence River. The mouth of the river is at Shoal Bay, 29° 20' S. lat. The bar across its entrance has 12 feet of water upon it, at high tides. _Brisbane River_ flows into Moreton Bay, and is navigable by ships drawing 16 feet of water 50 miles up, at which point a ridge of rocks crosses the bed, but to a distance of 12 miles from the sea, which is navigated by boats. Several of its tributaries are also navigable, by boats, 80 miles from their mouths. The country on both banks of the river presents an alternation of hills and level tracts. The soil is very fertile; it is well watered, and contains good pasturage. The highest hills lie on the north side of the river, where some rise from 700 to 600 feet. The fairest sources of the Brisbane are in the Coast Range, which here offers an easy passage to the interior by a gap which occurs south of the headland of Mount Mitchell, which is 4130 feet above the sea.

All the rivers draining the interior of New South Wales, as far as it is known, appear to belong to the river basin of the Murray. The rivers composing this system are very extensive, flowing westward from the high lands running north and south through New South Wales. The Murray itself we have noticed as dividing the colony from Victoria, and it enters South Australia at Table Cliff and Flinders Ranges, where it enters South Australia at 143° E. long. The Darling, by its upper branches, drains the country east of the Great Australian Plain, and the Condamine, rises on the Darling Downs, in 28° S. lat., runs northward as far as 26° S. lat., 151° E. long., then turns westward to 149° E. long., and then south-westward till it joins the Darling on its other bank. From the south it receives the Bogan, a considerable stream, rising in the Harvey Range; and it is probable that the Macquarie, at least during the rainy season, disembogues into it part of its water from the marsh in which it is lost.

The following is a general account of the geology of the island has been given under _Australia, S. 2._ Sir R. I. Murchison had asserted that gold must exist in the country under certain formations; and the same theory had been promulgated in the colony of New South Wales by W. J. Brooke, in his discourses in the standing of the Australian mountains running north and south through Victoria and New South Wales, were of the same formation as those of the Sierra Nevada in California, and the Ural Mountains in Russia, namely, granite mixed with quartz and schistose slate; but it was not till 1849 that the actual existence of gold was discovered. In 1851 further discoveries were made, Mr. Hargraves disclosed the places where he had found gold, and when the government officer was sent to examine the places, he found the gold for himself. On Mr. Mawson's instructions were given by the governor to grant licences to diggers at 3 oz. per month. The first discoveries obtained the gold by washing the detritus from the beds of the creeks, and the earth from the shores; but it was soon found that the richest deposits were in the quartz, and means were found to crush the rock and obtain the gold. On August 5th the governor issued a notice that the licences would only apply to the gold-washers, and that on gold obtained by river- or sluice-washing the Government would recover half. Policemen were appointed to the various stations, and escorts furnished for bringing the gold from the diggings to the ports of Sydney or Melbourne. In a short time the towns and villages were deserted, all the usual occupations abandoned, and thousands of persons flocked to the diggings, where all labour repaired to the diggings. An immigration ensued almost without a parallel.

Respecting other metals we have little to add to what is said under _Australia, S. 2._

Iron-ore is known to exist in several places, especially on the west of Blue Mountains. Several extensive coal-measures have been found, two of which are worked. Those found near the mouth of the Hunter River, near Newcastle, are extensively worked, and their produce is shipped to Sydney. The coal-beds near Western Port are also very large, and have been worked for several years. Limestone is abundant in some places, and some kinds of marble are worked on the banks of the Wollondilly River. On some parts introduce many kinds of fruit-trees and vegetables, and they have in most cases done it with tolerable
success. There are oranges, lemons, citrons, nectarines, apricots, peaches, plums, cherries, figs, quinces, pears, apples, mulberries, pomegranates, grapes, raspberries, strawberries, bananas, grapes, pineapples, gooseberries, currants; almonds, walnuts, peachstones and bitter almonds, which grow at the colder and more elevated countries, as near Bathurst. In the kitchen-gardens are raised melons, water-melons, pumpkins, capucins, cabbages, turnips, and some other vegetables.

The wool is a principal product of this country, and is exported from England, and the wool was of indifferent quality; but as soon as it became evident that wool might become a source of wealth, and yield an important article of export to the mother country, several landed proprietors were at consider- able expense importing sheep, which has been much improved. The wool imported into Great Britain from New South Wales in 1855 amounted to 17,671,664 lbs. The breed of cattle is a mixture of the Belgian and red stock, with hogs, the admixture of which has been considerable. The cattle and sheep are driven into the interior, and the various English breeds which have been introduced. They are fine large animals. In some parts, especially on the Plains of Bathurst, the dairies are well attended to, butter being made to a great extent, and also cheese not inferior to the common cheeses of England. Bullocks are mostly used for draught. The horses are remarkably hardy and can undergo great fatigue. Pigs find abundant food in the uncultivated tracts, and are easily fattened with maize. Goats have been introduced, and thrive amazingly in those parts which have a banana climate. The climate of this country is very stimulating, and there is a great demand for the product of the land, and a great demand for the product of the land, and

Poultry is in great abundance: geese, ducks, turkeys, guinea-fowls, and common fowls thrive surprisingly, without any particular care being taken of them.

The manufactory industry of the colony has made considerable progress, though the production and export of native commodities form the staple of the occupation of the inhabitants. The most numerous manufactory establishments are the mills for grinding and dressing corn, and the manufacture of wool, flax, hemp, and cotton, and the manufacture of woollen-wool, hats, huts, corn, and of articles of furniture; distilleries, breweries, iron and brass-foundries, rope-yards, and ship-building yards. As sperm-whales and blubber are very frequent in the waters of the sea around the coast, the entries of Base's Strait and the strait itself, and a great number of seals are found on the islands in the same part of the sea, the whale and seal fishery has become a source of gain to the colonists, and is still carried on, though it has fallen off considerably.

Commerce.—New South Wales, considered as a commercial country, holds a very high rank among our colonies, if its population is taken into account. Including the large quantities of wool, tallow, hides, and sheepkins, Great Britain imported from New South Wales, in 1854, to the value of 4,050,109s.; and exported articles to the value of 6,981,003s. These amounts have decreased in the years 1855 and 1856, but are still very large. Considerable quantities of wool are exported to the United States.

Divisions of the Country.—The more closely-settled portion of the colony is divided into 37 districts, 21 of which were added in 1847. Out of these are formed 40 counties, of which the first settled 21 are conterminous with the districts. The other counties do not occupy the whole of the districts, nor do the districts occupy the whole of the territory, but it is a regulation of government that no land can be sold beyond their limits. The extreme boundaries of county lands have come thereon to the same extent. The county of New South Wales on the south, and the county of New South Wales on the north, and the county of New South Wales on the east, and the county of New South Wales on the west, with the same limits, followed the discovery of that fine pastoral country the Downs of Bathurst. In the following years a practicable line of road was constructed over the mountain range by convicts. Mr. Oxley, in 1817, began the task of exploring the interior. Since this period some portion of the country has been nearly every year discovered and explored. Among the discoveries may be particularly mentioned Allan Cunningham, Lieut. Sturt, Capt. Strelitzka (who first ascertained that gold was to be found in the mountains), Mr. Oxley, Capt. Sturt, Strelitzka, and Dr. Leichardt, who, leaving New South Wales, reached the Gulf of Carpentaria, and who, on a second journey, lost his life in the interior. The results of their discoveries have been of great service to the geographical notices of Australia in the several colonies.

The system of transportation has been discontinued of late years.

Towns.—The capital is Sydney. Bathurst is a thriving town, 188 miles W.N.W. from Sydney, on the west of the
Blue Mountains, situated on the upper part of the Macquarie. It derived its importance at first from being the chief place of trade of the rich pasturage, Bathurst Plains, which surround it. It has since become of still greater importance from its vicinity to the gold diggings of Ophir, which lie from 20 to 30 miles west from it. 

Bundanoon, a small but rising port-town, near the southern border of the colony, on the mouth of the river Towambas, which here falls into Twofold Bay. 

Brisbane is at the northern extremity of the colony, situated on the river Brisbane, navigable for some miles from the sea. It is a flourishing town, in an agricultural district. Tobacco and wine are produced. 

Campbellton is on the coast, about 20 miles S. from Sydney, and has considerable trade and manufacture, particularly of leather. 

Liverpool is about 16 miles W. from Sydney. The town is an inland town, surrounded by a rich and well cultivated country, which secures it much retail business. 

Macquarie, or Port Macquarie, is a small but increasing town, at the mouth of the river Hastings, which a little higher up receives the Wilson and Maria rivers, and forms a tolerably safe bay. It is about 120 miles N. from Hunter River. 

Maitland is on the right bank and about 40 miles from the junction of Hunter River, at the junction of the Wallis creek. 

The river Hunter is navigable. 

The collieries in the neighbourhood have greatly contributed to the prosperity and increase of this place, which is properly two towns, East Maitland and West Maitland. In East Maitland are a court-house and jail, and in West Maitland are numerous premises of different kinds. A railway runs regularly from Maitland to Sydney. 

Newcastle, about 70 miles N. by E. from Sydney in a direct line, is built at the mouth of the Hunter River, which forms a harbour deep enough for merchant vessels, but the entrance is narrow and crooked. The town owes its importance chiefly to the collieries in its neighbourhood, which are extensively worked. 

It gives title to a bishop. 

Paramatta is situated at the mouth of the small river Paramatta, and at the head of the harbour. 

It is 150 miles from water, and 15 miles by land from Sydney. The principal street is a mile long; at the end farthest from the harbour is the country residence of the governor of the colony. Daily communication is kept up with Sydney by means of stage-coaches and steam-boats. The observatory at Paramatta (founded in 1821) was the private property of Lieut.-General Sir Thomas Brisbane, an active and well-informed astronomer, during his residence in the colony as governor. At his return to England, the government adopted it as a public establishment, and it is now under the superintendence of an observer appointed by the Admiralty. At Paramatta and in the vicinity are numerous lunatics, one of which is for convict lunatics and invalids. 

WindSOR, about 30 miles N.W. from Sydney, stands on the right bank of the Georges river, which is navigable for a few miles above the town for coasting vessels. This circumstance and the fertility of the country which extends along both sides of the river above the town have raised it to some commercial importance. There are at Windsor mills for grinding grain, breweries, and tanneries.
WALLACH, NATHANIEL, M.D. and Ph.D., F.R.S.,
London and Edinburgh, a celebrated botanist, was born at
Copenhagen on Jan. 28th, 1786. He commenced his
botanical study under the direction of Professor
Hortensius, and went to India in 1807 at the age of twenty-
years. He was appointed Director of the Botanical
Institution and to the Danish settlement in Sermapora.
In 1816 he was nominated to the temporary charge of the
Calcutta Botanic Garden, which appointment was subse-
cuently prolonged to two years. He found a botanist,
Dr. Fleming, Mr. Colebrooke, and Sir John Banks.
Dr. Wallach's exertions during the thirteen years that elapsed
before his first return to Europe added greatly to the extent
and value of the previously extensive collections of this
garden. He afterwards visited Ceylon, the Deccan, and the
quantity of hitherto unknown and beautiful plants. In 1820
Dr. Wallach made a botanical excursion to Nepal, in the
course of which he collected a great variety of plants, many
of which he forwarded to London. A few years later, caught
on his descent to the plains, confined him to his bed for two
months and compelled him to seek benefit from a voyage to
Penang, Singapore, and some other places in the Straits of
Malacca, from which, after an absence of five months, he
returned on the last day of the year 1822, rich in botanical
collections and with renewed health. In 1824 he
commenced the publication of a selection from his Nepaul
collections under the title of 'Vestnetum Flora Nepalesiana Illustrata,' of which two numbers, containing 20 plates, were
published. The edition was quickly exhausted. In the same
year he published a new art of lithography in India, and both
drawings and lithographs were executed by native artists under
Dr. Wallach's direction.
In the same year he was appointed by the government
to explore the timber forests of the Western Provinces, and
availed himself of this opportunity to examine and collect
plants in the kingdom of Oude, the valley of Degra, &c.
Excursions to other parts of India were undertaken at
short notice, the number of which enabled him to still
further to increase the immediate stores of botanical treasure
he had accumulated. His health had now however suffered
so severely from repeated attacks of illness that in 1828, he
visited England, bringing with him the great bulk of his col-
cctions. When he again returned to England in 1833, the
company proceeded to distribute his duplicates
amongst the public and private herbaria throughout the
world. The type collection, containing a complete series of the
species, was presented by Dr. Wallach to the Linnean
Society of London. At this time he completed his work
entitled 'Planta Asiatice Rariorum,' consisting of 300
beautifully executed coloured plates. In 1833 Dr. Wallach
returned to India and resumed the charge of the Botanical
Garden. He was elected a Fellow of the Linnean Society in
1847, when he again visited England. He was the
author of numerous papers and reports on horticultural
and botanical subjects, published in the 'Transactions of the
Asiatic Society of Calcutta,' Sir W. J. Hooker's 'Journal of
Botany,' and other periodicals. He was also a Fellow of the
Linnean Society in 1818, and in 1849 one of its vice-presidents.
He was a man of warm affections, ready
wit, and pleasing manners, and devoted in his attachment to
his favourite science. It must not be forgotten that he
died at his house in Upper Gower-street, London, on
the 29th of April 1854, in the 69th year of his age.
WALTER, JOHN, late manager and principal proprietor of
The Times, was born at Drogheda, Ireland, in 1788. He
was the son of John Walter, who was born in 1739, was known as the
ogrographic printer, from his having obtained a patent for an
invention named Logography, or the art of printing with
single words. The undivided management of single letters. On the 1st of January, 1788,
he published the first number of 'The Times,' and was
fearing eight years printer to the Board of Commons, but
has employment was taken from him about 1805, in conse-
quence of the appointment of a new Poor Law Commissioner. In 1814 he
was returned for the borough of Nottingham, and at the general
election the same year announced himself as a candidate,
but in consequence of serious rioting, withdrew half an hour
before the polls opened. He was returned for the
Residence, Printing-House Square, Blackfriars, London.
WARBURTON, ELIOT BARTHOLOMEE GEORGE,
eldest son of the late Major G. Warburton, of Augh-
rim, county Galway, Inspector-General of Constabulary in
Ireland, was born in 1610: he represented a branch of an old Cheshire family. He received his early education at home and under the care of a tutor: then entered Queen's College, Cambridge, but after his second term he migrated to Trinity, where he took his degree. He was subsequently called to the bar, but soon ceased to practise, and then returned to the care and influence of his first tutor. He first became known to the world as an author by his captivating work on the East and Eastern Travel, entitled the 'Crescent and the Cross,' which was first published in 1636, and at the present time is regarded as a source of knowledge for the history of the Caliphate, which is now (1856) in the 13th edition. It was followed in 1849 by his 'Prince Rupert and the Cavaliers,' a brilliant history and vindication of the gallant prince, who so chivalrously distinguished himself in the civil war under Charles I. He next wrote 'Historical Sketches of Hastings,' a reference and illustrative of the same period. Shortly afterwards he edited 'Memoirs of Horace Walpole and his Contemporaries.' His last work, which was published after his death, is entitled 'Darem,' or the Merchant Prince; it is a tale founded on the colony established about the middle of the 17th century by a Scottish adventurer named Paterson, on that portion of the northern coast of South America which abuts on the fathoms of Panama, and is known by the appellation of New Spain. In 1852 a day was dedicated to the late Mr. E. Grove, Esq. of Stonestone Park, Staffordshire, and niece of Sir E. Craddock Hartopp, Bart., by whom he left issue, two sons. He was lost in the ill-fated America, which sailed on March 30th of last year, February 4, 1852.

WARD, ROBERT PLUMER, was the eldest son of Mr. John Ward, a Spanish merchant resident at Gibraltar, who had married a Miss Raphael, a Spanish Jewess; and was born on the 19th of March, 1765. He was educated at a school under the late Lord Mulgrave and the Right Hon. Sir Charles Yorke; he served the office of Clerk of the Ordnance from the latter date till 1832, when he was appointed one of the auditors of the Civil List—a post which has since been abolished. He served as high sheriff for the county of Hertford in 1822, and for many years held a seat in parliament, which he entered in 1802 as member for the borough of Cockermouth, and subsequently for the disfranchised constituency of Haslemere. Amongst all his political and parliamentary labours Ward found time for the composition of several works of history and of fiction. Of the former, the best known is his History of the Law of Nations in Europe from the time of the Greeks and Romans to the age of Grotius, which was published in 1796, and was pronounced by the British and French as the greatest contribution to the principle of his novel, 'Tremaine' and 'De Vere' are those which have attained the widest circulation. The former was published anonymously in 1825, and the latter in 1827. His other works are—An Inquiry into the Conduct of European Wars, 1803, a pamphlet which first enlisted on his side the patronage and favour of Pitt; Illustrations of Human Life, 1837; Pictures of the World, 1810; Historical Essay on the Revolution of 1688, 2 vols.; S36, and, lastly, 'De Clifford,' a novel, published in 1841.

From the middle of 1809 till late in life Mr. Ward kept a political diary, which has since been published down to the year 1830. It is valuable as an historical document, and as throwing some light on the state of things under the Per- cival and Liverpool administrations. Mixing largely with the world of politicians, and being equally skilful in gathering and prompt in recording the gossip of the day, Mr. Ward was able to provide an account of the events occurring to Canning, Castlereagh, the much-debated question of the Regency, and the proceedings against Queen Caroline, which are not to be found in any other publication. The latter period, however, is not at present withheld from publica- tion, owing to the warmth of its political and literary facilities in the hands of the Society. The severity of its comments on living statesmen. The 'Diary' will be found in the Memoirs of the Political and Literary Life of Robert Plumer Ward, Esq., published in 1850 by his friend and relative the Hon. Edmund Phillips, 2 vols. 8vo.

Mr. Ward was thrice married: first, in 1796, to a daughter of C. J. Maling, Esq., by the Dowager Countess of Mulgrave; secondly, in 1822, Jane, daughter of the Hon. and Rev. George Hamilton, son of the second Earl of Abercorn, J.P. (an Irish Chief Colonel Plumer, M.F. for Herts in the 17th century), and in consequence assumed the additional name and arms of Plumer; his third wife was a Mrs. Okeover, a daughter of the late General Sir George Okeover, K.B., and late of St. George's, Erk天鹅, two of the founders of the Scotch Secession Church. Ralph received his early education at the public schools of Glasgow, to which city his parents removed shortly after his birth. He entered the University of Glasgow in October, 1776, and graduated B.A. in 1800 and M.A. in 1803. At the age of thirteen years, age, carried off the Muirhead prize in the Humanity class. He was distinguished as a diligent and careful student, and gained several other prizes in his university career. He was also nominated to a fellowship at the University, which was then being organised by Messrs. Haldane, Aikman, and Ewing, and from the first he took a respectable, and very soon a leading position among the ministers of that body. A building having been erected by a number of his countrymen, and afterwards converted into a presbyterian church, a church was formed, and Mr. Wardlaw commenced his services on February 16, 1803. This position he maintained with much credit to himself, and usefulness to the independent body, and in the meantime continued to be a large, till his death, a period of more than fifty years. On August 23rd 1803, he married his cousin, Miss Jane Smith, daughter of the Rev. Mr. Smith, of Dunfermline, by whom he had a family of eleven children. In 1811 Mr. Wardlaw was elected Professor of Systematic Theology in the Theological Academy of the Independent body, which was then established in Glasgow. In 1818 he received the Diploma of D.D. from Yale College, Connecticut, and in December 1820 received the degree of D.D. from the University of Edinburgh, in recognition of some chapel in George-west-street, the erection of which had been rendered necessary by the increasing attendance on his ministry. In 1848, Dr. Wardlaw's health being somewhat impaired, the Rev. S. T. Porter was chosen as co-adjutor, and on the death of the former in 1849, which occurred for about two years, when the differences arose in consequence of charges made or supported by Mr. Porter against Dr. Wardlaw, the result of which was the separation of Mr. Porter and a portion of the members from West George-street church, and the formation of a new church under Mr. Porter's pastoral charge. In this case, the deacons and the great body of the congregation adhered to Dr. Wardlaw, and a crowded meeting was held in the City Hall to express sympathy for him, and to present a large sum of money as a token of the approbation of the conduct of the fifteenth year of his ministry was celebrated by special services and a public meeting, in connexion with which a large sum of money was collected, and expended in erecting 'The Wardlaw Jubilee School and Mission House,' at the west end of the city. He died on December 17th, 1853, within a few days of completing his seventy-fourth year.

Dr. Wardlaw took an active part in various public questions, and was a member of the Committee of the House of Commons, which gave rise to some of his most elaborate publications. He was frequently invited to London to preach anniversary sermons, and speak at public meetings of the great religious societies. On several occasions he declined invitations to anoint the sovereign, and to a large extent his work in England. In April 1833, he delivered in London eight lectures in defence of Congregationalism, forming the first series of an annual course called 'The Congregational
Lecturers. In April 1839, at the request of the Protestant Dissenting Deputies, he delivered eight lectures in Freemasons' Hall, London, in answer to the Lectures on Church Establishments, which had been delivered in London the previous year by Dr. Chalmers. As a preacher, Dr. War- law was much esteemed, and his discourses, which were very carefully prepared, were generally well written, and read with a clear andsilver voice, and a calm but impressive eloquence. The following list contains the titles of his principal productions; many single discourses, though delivered to distinguished ministers, and other friends, were likewise published by him. In 1803 he edited a Hymn Book for the Congregationalists in Scotland, containing several hymns of his own composition; in 1807 he published 'Three Lectures on Romanism,' V. 8vo, issued in 1816, 'Essay on Dr. Joseph Lascarac's Improvements in Education;' in 1814, in one volume, 8vo, 'Discourses on the Socinian Controversy,' in answer to Mr. Yates, the Unitarian minister in Glasgow; in 1818, in 8vo, 'Unitarianism incapable of Vindication,' in reply to Mr. Yates's 'Vindication of Unitarianism;' in 1817, 'Essay on Benevolent Associations for the Poor;' in 1831, in 3 vols. 8vo, 'Expository Lectures on the Book of Ecclesiastes;' in 1838, 'A Dissertation on the Christian Baptism:' The 'Divine Dissuasive against the Young against the Enticements of Sinners;' 'Man Responsible for his Beliefs,' in answer to Lord Brougham's inaugural dis- course, in 1835, 'Preparatory Essay to Doddridge's Practical Discourses;' 'Remarks upon Mr. Serjeantson;' in 1830, 'Two Essays: I. On the Assurance of Faith; II. On the Extent of the Atonement and Universal Pardon;' in 1833, 'Discourses on the Sabbath;' 'Civil Establishments an Establishment.' In 1838, he published Baptist Ethics;' or Moral Philosophy on the Principles of Divine Revelation;' in 1835, 'Two Lectures on the Voluntary Church Question;' in 1836, 'Friendly Letters to the Society of Friends;' in 1839, 'National Church Establishment' con- sists with Dr. Chalmers' 'Sketch of the Life and Character of the Rev. Dr. McAll of Manchester,' prefixed to Dr. McAll's Sermons, edited by Dr. Wardlaw; in 1841, 'Letters to the Rev. Hugh Neil of Strath; A. Centre period of his Lectures on the Church of England;' in 1842, 'Lectures on Female Pesti- cution;' in 1845, 'Memoir of the Rev. John Reid, Missionary at the East Indies, and Dr. Wardlaw's son-in- law;' The Life of Joseph and the Last Days of Jacob: a sketch of theSciences' and 'Congregational Lecture on the Sacraments,' in reference to Infant Baptism, &c.; in 1848, 'Congregational Indepen- dency, in contradistinction to Episcopacy and Presbyterianism, the Church Policy of the New Testament;' in 1859, 'The Bible and the Empiric philosophy;' in 1863, 'The Life of Dr. Warneford,' likewise a contributor to various religious periodicals. Of Dr. Wardlaw's sons, one is a missionary in India, another a merchant in Glasgow. (W. L. Alexander, D.D., Memoirs of the Life and Writings of Ralph Wardlaw, D.D.)

WARNEFORD, REV. SAMUEL WILSON, was the son of the Rev. Francis Warneford, vicar of St. Martin's Yard, an old and wealthy North Wiltshire, and he was born in 1770, near Newbury, in Wiltshire, in 1775. At the usual age he was sent to University College, Oxford. Ill-health prevented his attaining any academical honors, but he graduated M.A. 1786, and B.C.L. in 1790. He inherited from his father a considerable fortune; but a few years left him a widower without issue. In 1809 he was presented by his college to the rectory of Lyddington Milicent, Wiltshire, valued at 500l. per annum; and in 1810 he was presented to the rectory of Bourton-on-the-Hill, in Gloucestershire, which he resigned in 1843 after 70 years, and in the same year he took up the degree of D.C.L. He lived at Bourton very pleasantly and sociably, and from an early period devoted a great part of his property to the promoting of large establishments. Among the institutions which arose from his common practice of bestowing trifling eleemosynary sums, refusing, it is said, assistance even to the poorer members of his own family. But there was no ostentation in his manner; while he contributed annually to the funds and almshouses in his own parish. He was contributor to schools, colleges, and hospitals throughout the kingdom. On the Clergy Orphan School, at various times, he bestowed 18,000l.; and he contributed large sums for church purposes, particularly in his own county of Gloucester, and in Nova Scotia. He founded an hospital at Leamington, which bears his name; and one for lunatics on Headington Hill, near Oxford. To King's College in London he presented among several donations of 600l. each; but to Queen's College, Birmingham, the total amount of his contributions was upwards of 25,000l. This institution was commenced by Mr. Sande Cox as a school of medicine, and Dr. Warneford liberally afforded pecuniary assistance in founding it to become a college, which was ultimately patronised by the royal family. When it was found desirable to add other departments of education, Dr. Warneford was again the chief contributor; and desirous of giving the religious instruction should be afforded, he founded the college chapel, which is entirely devoted to the permanent religious teaching. In 1844, in recognition of his wide-spread beneficence, the bishop of Gloucester conferred on him an honorary canonry in Gloucester Cathedral; and in 1849 a statue of him was erected in the Warneford Lunatic Asylum at Oxford, the expense being defrayed by public subscription. He died at Bourton on January 11, 1855, enjoying good health till within a few days of his death. He bequeathed 500l. to the Christian Knowledge Society, 50l. to the Oxford University Mission Society for the Propagation of the Gospel, and in addition to various gifts. W.A.R. A.N. PESS (SthHHHb, S. I.)

WARWICK. [MINERALOGY, S. I.]

WASHINGTON. [MINERALOGY, S. I.]

WASHINGTON, a Territory of the United States of North America, lies between 45° 20' and 49° N. lat., 110° 30' and 124° W. long. It is bounded E. by the Rocky Mountains, which separate it from the Territory of Nebraska; N. by the parallel of 49° N. lat., which separates it from the North American States; W. by the Pacific Ocean; and S. by the Territory of Oregon. The area is 123,022 square miles. The population in 1857 was estimated at 10,000. At the Census of 1850 Washington formed a part of the Territory of Oregon, which contained 15,924 inhabitants. The country separated from Oregon in 1853, and in 1854 became the first Territory of the United States, in 1859; and in 1861 Washington, then contained less than 2000 inhabitants, exclusive of the native Indians, who probably number about 7000 or more. In its general character Washington is calculated resemblance to Osonon. The surface is generally broken, being traversed from south to north by three parallel ranges of mountains, the northern prolongation of the Oregon ranges, while the Rocky Mountains, as in that Territory, form its eastern boundary. The principal streams are the Columbia to the entrance of Gray's Harbour, or, as it was named by Vancouver, Whidbey's Bay, a distance of 45 miles, is rocky and almost unbroken. The entrance to Gray's Harbour is about 24 miles across, but the harbour itself is distant from 12 to 15 miles in length, and affords well-sheltered anchorage in some places, but it is everywhere encroached on by sand-banks, and its mouth is obstructed by a bar, which only admits the passage of vessels drawing under 10 feet of water. From Gray's Harbour to Cape Flattery, or Cape Casquet, a lofty promontory at the southern side of Juan de Fuca Strait, a distance of about 80 miles, the coast is high, rocky, and only broken by two or three unimportant streams. The Strait of Juan de Fuca, which forms the northern point of the coast of Washing- ton, is a vast arm of the sea, about 10 miles wide at its mouth and 100 miles deep. [VANCOUVER ISLAND, S. 2.] The southern coast consists of perpendicularly sandy cliffs of little altitude, except towards the strait, where it is formed by the entrance of the strait, which is a strait of land sandy point which forms a good anchoring-ground; and beyond this is a deep bay about 3 miles across, and 3 miles from its eastern point is Protection Island, so named by Vancouver from its position at the entrance to Port Discovery. Immediately beyond Port Discovery is Port Hudson, an equally safe and good though somewhat smaller harbour: Vanouver and Puyget unite in describing them as among the finest harbours on the coast of North America. This harbour is a deep inlet named Admiralty Inlet, which soon divides into two arms—the smaller one named Hood's Canal, bearing to the south-west, and stretching far into the interior, proceeding for about 40 miles, where it terminates in a broad sound named Puyget's Sound. Both these branches afford good anchorage; but Puyget's Sound is broken by several inlets, and affords the
WAS TAT

River. Its northern branches rise in the Rocky Mountains within the Hudson's Bay Territories, and unite in Washington; the united stream traversing the Territory in a generally southern direction, and receiving numerous tributaries. It forms the Columbia by the junction of the SAPhine or Lewis River. The principal tributary of the southern branch of the Columbia are the Kootanie or Flat Bow, the Flathead or Clarke, and the Spokane rivers: they are all very rapid streams, but navigable by boats for some distance. The chief river north of the Columbia is the Chelaksa, which issues from the south branch of the Columbia through the very tortuous course to its outfall in Gray's Harbour. Its course is very rapid, and it is only navigable by canoes; it receives several small streams from the high grounds about Hood's Canal and from several small lakes. The Nisqually and Chehalis rivers, fall into Puget's Sound; they are both navigable for some distance, but will probably prove of greater value for their mechanical power. In the interior are numerous lakes, the larger being chiefly expansions of the northern branches of the Columbia, the Spokane, and the Clark river.

At present the rearing of horses and cattle has attracted most attention from the settlers, but agriculture is rapidly extending. The productions are similar to those of Oregon. Wheat is the chief grain crop; maize has not been much cultivated. Beets, potatoes, and flax are also grown in small quantities. The forests yield an unlimited quantity of fine timber. Coal is found in the neighbourhood of Puget's Sound, and near the Chelaksa and Monticello rivers. Iron and other metals have been found; but mining operations have as yet been but little heeded. A district of valuable gold lodes has been discovered near what is now called Gold Bar. The Columbia will probably become an important part of the industry of Washington. All the rivers abound in fish; salmon being especially abundant. Fish also abound on the coasts. Whales frequent these waters and the schools of salmon abound. The Columbia River abounds with trout and whitefish, and shell-fish are very abundant. The commerce of Washington is yet in its infancy, but it is steadily increasing. Nearly all the commerce centres in the district of Puget's Sound.

Washington has as yet no town of many inhabitants. The principal city is Olympia, on the right bank of the Tenalquait or Shute River, at its entrance into Puget's Sound. This town boasts of its hotel, stores, saw- and grist-mills—the first in the Territory—newspaper, &c.; and contains 200 inhabitants. The capitol is on the bank of the Columbia River, on the right bank of the Columbia City, on the right bank of the Columbia, below Fort Vancouver; Monticello, the capital of Lewis county, and the place where the convention was held which led to the separation of Washington from Oregon; Nisqually, on the east side of Puget's Sound, the property chiefly of the Puget's Sound Agricultural Company, whose farms supply provisions to the servants of the Hudson's Bay Company west of the Rocky Mountains; and Pacific City, on the right bank of the Columbia, about 40 miles above the mouth of the Columbia, on the ocean side of the Columbia, which appears likely to become a place of some trade.

Washington was separated from Oregon, and received a territorial constitution, by Act of Congress, March 2, 1853. By this Act the right of voting is vested in every free white male twenty-one years of age, and the electoral vote is given by the legislature. All laws passed by the legislature must be submitted for confirmation to Congress. No law can pass interfering with the primary disposal of the soil; or taxing the property of non-residents higher than one-half the rate on real estate. The political capital, Olympia, is located at the mouth of the Nisqually River. The Columbia River is the principal source of the Columbia River system. The Columbia River is the Columbia, which belongs equally to Washington and Oregon; it is described under Columbia River.
philosophy and chemistry, and he had also applied himself to the practical study of mineralogy. It is scarcely known, and has not been recorded in any previous biographical work, that he was for a short time, when in his twentieth year only, one of the secretaries of the Literary and Philosophical Society of Manchester, then just founded, one of the earliest, and perhaps the most distinguished of the provincial civil-service. To the Memoirs of this society he contributed two papers, in 1786, and in the years 1788 and 1789 (Inglespark, near Chorley, in Lancashire) -in which the aerated carbonates of barytes are found, and the other on the effects produced by different combinations of the Terra Fonderosa, he was one of the first to establish the principle of adaptation. From the time of his departure from the army, the aid, the actual discoverer of the carbonate of barytes at Anglicark, he was the first to describe, in the paper here alluded to the circumstances under which it occurred, and to make known the fact that the specimens examined and the supplies of the mineral from which it was prepared were, the urate, which had been recently introduced into medical use by Mr. Adair Crawford, F.R.S., had been obtained from that locality. His also were some of the earliest experiences on the poisonous effects of the combinations of barytes.

A remarkable episode now occurred in the life of the young philosopher-for such, at this period, we may call him. Mr. Watt had directed his son's attention to the study of mineralogy, which he began with a series of excursions and observations. Amongst those that appear, by his friend Thomas Cooper, one of the vice-presidents of the Manchester Society, and who afterwards became professor of chemistry in Columbia College, in America— he proceeded to Paris. But here, carried away by the movement of liberty, he sympathised with the Girondists and Jacobins, and even took some open and avowed part in their earlier tumultuous agitation, in company with Cooper, and subsequent to what the poet also. Southey has recorded, from the information of James Watt himself, that so high was he at first regarded by the French leaders, that he was the means of preventing a duel between Danton and Robespierre. A more public exhibition of zeal in the cause of liberty was the following. When the Girondists were besieged and surrounded by Berns in the House of Commons. The licence and excursions of the revolutionary parties however opened the eyes of the young enthusiast to the real nature of the principles he was supporting, and he then surrendered to mitigate as far as possible the violence which he foresaw he must in future deplore. This became eventually the cause of his quitting Paris and abandoning his French associates and their objects; for Robespierre, at the club of the Jacobins, the committee of public safety, which investigated the memorials of Pitt, the British prime minister, James Watt indignantly silenced his formidable antagonist from the tribune in a brief but impassioned harangue, delivered in excellent French, carrying with him the feelings of the rest of the French nation. Returning home he learned that his life was no longer safe for a day, instantly left Paris, succeeded with difficulty in making his way to the south, and did not rest until he arrived in Italy.

Not long afterwards he returned to England, and in 1794, as already intimated, began to be actively engaged as a partner in the management and direction of the steam-engine factory at Soho, which necessarily withdrew him from political and also from scientific pursuits, strictly so called, and what he effected in the latter has almost escaped notice.

Mr. James Watt took a part in the progress of steam-navigation, especially as regarded the requisite adaptations in the construction of the engines, not unworthy of his name and of the reputation of the firm of which he became the leading partner. Mr. Henry Bell of Glasgow, who had in 1811 taken the enterprise step of himself trying, in Scotland, at his own risk and under his sole direction, an experiment similar to that which, in the hands of Fulton (whom he much resembled), had proved so successful, had built several steam-vessels propelled by engines of his own construction. Among these was the Caledonia, of 108 tons and 52-horse power, which was launched in 1815, but from defective engines has been little used. The ship was, however, she was purchased by Mr. James Watt, who had her machinery taken out and replaced by two new engines of Soho manufacture, of 14-horse power each. In October he went over in her to Holland, and ascended the Rhine as far as Coblenz; having thus been the first to leave the British

abores and cross the Channel by so novel and, as it was then esteemed, so hazardous a mode of transit. On her homeward voyage she entered the Scheldt and visited Antwerp, and was then laid up for part of the winter in the harbour of Rotterdam for repairs and alterations. "After her return to the Thames in the spring of 1818," it is stated by Mr. Muirhead, to whose Memoir we are indebted for these particulars of the history of steam-navigation in this country, "Mr. James Watt was the first to bring to a practical issue experiments with vessels that made the water with the river (the whole number of those experiments amounting to 200), which resulted in the adoption of many most material improvements in the construction of marine engines, and in the third edition of that branch of the manufacture at Soho." The marine engines manufactured there down to the year 1854, were in number 319, of 17,438 nominal, or 53,314 real horse-power.

Some further particulars of Mr. James Watt may be gleaned from the two later publications of Mr. Muirhead. He wrote, in 1852, the Memoir of his father in Macvay Napier's Supplement to the 'Encyclopaedia Britannica' (subsequently transferred, in substance, to the third edition of that work); and in 1846 he addressed a letter to Mr. Muirhead on his father's claims as to the composition of water; which is prefixed to the 'Correspondence' of the latter on that subject. The publication of his father's manuscripts and documents relating to them was originally designed and, to a considerable extent, prepared by him; but, from the infirmities of age, confided prior to his decease to Mr. Muirhead, by whom it has been accomplished in the work already cited and described.
The Dover Railway traverses the beds of the Wealden between Red Hill and the brach-nbine to Tunbridge Wells, exposing the Wealden Beds and the Upper Chalk Beds sands.

The fossils of this group are as follows:

**Planta.**
Corallites Mantelli, Loc.
Chlorispartein Mantelli, Bron.
Cottus mantelli, Mant.
Bromeliad Martelli, Mant.
Sphenophyllum Martelli, Mant.
Sphagnum Martelli, Mant.
Serrata Mantelli, Mant.
S. Sphagnum Mantelli, Mant.

**Insecta.**
Corallus elongatus, Brod.
Corallus latistriatus, Brod.
Aderia sediplicata, Brod.
Diptaa Stricklandii, Brod.
Coccus maculatus, Brod.
Rutina fulva, Brod.
Coccus pongum, Brod.
Coccus castaneus, Brod.
Cytoneura punctata, Brod.

**Crustacea.**
Cypria, 5 species.
Clypeus Dismayria, Brod.

**Cockles, Lat.**
Buccinum Tellinoides, Sow.
Unia, 10 species.

**Mammalia.**
Phrygarcha bulla, Sow.

**Gasteropoda.**
Acmae Podii, Sow.
Bulla Mantelli, Sow.
Melanosia, 2 species.

**Placida.**
Acrodes Hirudo, Ag.
Hybodius, 6 species.

**Gnathan.**
Tetragonolophus mantelli, Ag.
Ophiopeus penicillatus, Ag.
Gyrodus, 2 species.
Lepidostoma, 3 species.
Ficnodus Mantelli, Ag.
Pholidophorus ornatus, Ag.

**Reptilia.**
Caterus, 2 species.
Chelidonia, 2 species.
Chelidochus cruciatus, Owen.

**Pulsatilla assurma, Mant.**
Platysma Mantelli, Owen.
Potokileurum Bucklandii, Owen.

**Oxynota assurma, Mant.**
Suchesia cruciata, Owen.

**Megacorynus Bucklandi, Mant.**
Tristis lepidoc, punctatum, Mant.

(Tenant, Stratiographic List of British Fossil.)

WEAVER, THOMAS, F.R.S., an eminent geologist, was one of the band of learned men, who, with the late Professor Jameson, the late Leopold von Buch, and Alexander Humboldt, learned the rudiments of mineralogy and geology under the tuition of Werner at Freiberg, where he commenced his studies in 1829. He was long a distinguished and active member of the Geological Society of London, particularly in its earlier days; and was elected a Fellow of the Royal Society on the 9th of March 1839. From 1836 to 1878, and again in 1861, he was concerned, with the gentlemen mentioned below, in the exploration, on account of the geological, of the deposits of gold which had been discovered at Croucham Kinhella, in the county of Wicklow, in Ireland. An account of the discovery was given by John Lloyd, Esq., F.R.S., and a mineralogical account of the gold itself by Abraham Mills, Esq., both referring to Mr. War, were published in the *Philosophical Transactions* for 1839. A particular history of the proceedings of himself and his colleagues, in reference to the gold workings, was given by Mr. Weaver in the *Transactions of the Geological Society,* first series, vol. v. He afterwards com-
no means lucrative. In 1808 he married his first wife, by whom he had two sons and two daughters, of whom only one son, Fletcher Webster, survived him. He was a naval officer of the port of Boston. In May 1813 Daniel Webster took up an appointment as a Representative of the Federal Assembly of New Hampshire. Placed by Mr. Clay, the speaker, on the committee of foreign affairs, he made his first speech in the house of representatives, June 10, 1813, in moving a series of resolutions on the Berlin and Milan decrees. In August 1814 his house, furniture, library, and manuscript collections, were all destroyed. In August 1816 he was again returned as a representative to congress. From March to December 1815 he was busily engaged in the practice of the law at Plymouth, where he was destined to remain, but on the 28th of December, he was removed to Boston, where the causes for trial were of higher importance and the practice was more lucrative.

Mr. Webster retired from congress in 1817. He had purchased an estate of about 2000 acres at Marshfield, about thirty miles from Boston, and his time during the next six years was partly occupied with law business at Boston and partly with the cultivation of his estate. His favourite amusements were angling in the streams and fishing in his yard. He retired to private life, again elected senator in 1827, as he was also in 1824 and 1826. In 1827 his first wife died. In January 1828 he took his seat in the senate of the United States, having been elected by the legislature of Massachusetts. He was a candidate for the presidential nomination in 1828, but defeated on the twelfth votes of Massachusetts.

In the spring of 1839 he visited Europe for the first and only time in his life, and made a hasty tour through England, Scotland and France. When General Harrison became president of the American army, he was appointed a senator from Massachusetts.

In 1832 he negociated with Lord Ashburton the Oregon boundary, and the treaty which settled that question between Great Britain and the United States was ratified August 20, 1842. In May 1843 he resigned his situation as minister, and retired to private life. In July 1844 he was opposed to the war with Mexico in 1846, as he had previously opposed the annexation of Texas. In 1848 he was again a candidate for the presidency, but was un-successful. In the 5th of General Taylor in July 1849, he was opposed to the war with Mexico in 1846, as he had previously opposed the annexation of Texas. In 1848 he was again a candidate for the presidency, but was unsuccessful. His speech upon the nomination of Mr. Van Buren was criticized by the New York Sun. In 1848 he was again a candidate for the presidency, but was un-successful. His speech upon the nomination of Mr. Van Buren was criticized by the New York Sun.

In the autumn of 1850 the 33rd regiment, embarked for the West Indies; but the ship, after lying towed at sea for six weeks, was obliged to put back to the great south, and the 33rd regiment was landed again, in April 1850 was sent to India. Colonel Wellesley (for he had been promoted to the rank of Colonel in May of that year) was shortly afterwards attached at Mysore, and then at the Cape of Good Hope, and proceeded with it to Calcutta, where he arrived in February 1870, and was placed on the Bengal establishment.

In May 1862, Colonel of Mornington, Colonel Wellesley's elder brother, arrived at Calcutta, having been appointed governor-general of India on the 4th of October 1871. One of the first objects that required his attention was the equinoctial attitude of Tippoo Sahib, sultan of Mysore, towards the English. In the month of June a proclamation of the French governor of the East Indies announced the arrival of two ambassadors from Tippoo, to propose an alliance offensive and defensive for the purpose of expelling the English from Mysore. Colonel Wellesley, as a Governor-General of India, was considered as having been formally received by the sultan, and was taken to Mysore in a French ship of war. These movements of Tippoo were connected with the French expedition to Egypt. The Earl of Mornington wrote several conciliatory letters to Tippoo, to induce him to settle any peaceable differences between him and the East India Company by means of negotiation, but at the same time he did not neglect to prepare for offensive operations, and in November an army was assembled at Vellore, under General Harris, ready to enter the territory of Mysore. At this time Colonel Wellesley, with his regiment, formed part of this force. The army was joined by a large contingent from the Nizam of the Deccan, an ally of the English; and as the court of Mysore was opposed to the French, and Tippoo was not to be governed by the French, the Governor-General was appointed to the command of the contingent, General Harris ordered the 33rd regiment to be attached to the Nizam's force, the general command of which was given to Colonel Wellesley. As Tippoo declined to
enter into negotiations, and was evidently trying to gain time, the allied British and native army was ordered to advance to Mysoor, which they entered early in March 1799. On the 27th an engagement took place, in which the led in the battle of Seringapatam. Colonel Wellesley, rear body of Tipur's choice infantry. The army then advanced to Seringapatam, Tipur's capital, and Colonel Wellesley was employed to dislodge the enemy from some strong posts in front of the town, which he executed in gallant style, and without loss. The siege of Seringapatam continued, and on the 4th of May the place was stormed by a party under General Baird. After the storming was over, and the confusion begun to subside, General Baird desired to be relieved, and it was ordered that the gharrys should be removed from the gates of the place. By his exertions and firmness he succeeded in stopping the plunder within the town. Tipur Saib was slain.

In July 1799 Colonel Wellesley was appointed governor of Seringapatam, then the capital of Mysoor. During several years he held almost vice-regal command in Mysoor he was fully occupied in organising the civil and military administration of the country, and in the execution of this task he improved his natural talents for business, military and civil, and displayed the quickness of perception and the decision of character which have characterised him throughout the whole course of his military career. From the beginning he also paid particular attention to the wants of his own soldiers, and to the management of the hospitals, and to all the particulars of the Commission and Quartermaster-General's departments, which constitute half the business of an army, and, to use his own words, if neglected, "misfortune and disgrace will be the result." Colonel Wellesley, after a harassing service in the campaigns of 1801, 1802, 1803, and the first six months of 1804, he was ordered to the East India Company's factory at Trincomalee, in the island of Ceylon, for foreign service, and he early in the year proceeded to Mysore to Trincomalee. The expedition sailed from Mysore on 1st July, 1801, and arrived at the Isle of France. Meantime despatches from England arrived, directing 3000 men to be sent to the Red Sea to act against the French in Upper Egypt, whilst an expedition from England, under Sir Ralph Abercrombie, was attacking Lower Egypt. The despatch from Lord Maida, announcing the despatch of copies of the despatches from home, and as he knew that his brother, the governor-general, when he ordered the assembling of the forces at Trincomalee, had some expectation of its being required for Egypt, Colonel Wellesley, upon his own responsibility, moved at once the whole force to Bombay, where it could be supplied with provisions and other necessaries previous to sailing to the Red Sea, and where he would be ready to receive final orders from the governor-general. He arrived at Bombay about the middle of February, 1801, and arrived at Bombay about the middle of March. The governor-general had appointed General Baird to command the Egyptian expedition, leaving to the brother the choice of going under him as second in command, or retaining his own command in Mysore. When Lord Mordaunt learnt that Colonel Wellesley was at Bombay with the whole Trincomalee force, he could not disapprove of this movement, as he had himself intended to send to the Red Sea a larger body of troops than that which was sent by Trincomalee, but he thought it ought not to be set up as a precedent, and he required an official explanation of the grounds and motives which had induced his brother thus to act upon his own judgment, rather than on orders. Colonel Wellesley stated his motives at full length, and General Baird, on March 23, 1801. ('Dispatches,' vol. 1.) He intended to proceed to the Red Sea, and to have served under General Baird; but on the 30th of March he was seized with fever, and soon afterwards returned to his government in Mysore.

Before leaving Bombay he transmitted to General Baird a memorandum which he had written containing the operations in the Red Sea, availing the research and collection which he had bestowed on his anticipated command. Colonel Wellesley made a second entry in his Mysoor, near two years. He was raised to the rank of Major-General in April 1808, and in February 1808 he was appointed to command a force intended to march into the Maharratt territories.

Civil war raged between the Maharratt chiefs Holkar and Scindia. The Peishwa, the nominal head of the Maharratt confederation, was looked upon as an instrument in the hands of the strongest. Dowlut Rao Scindia, who ruled Malwa, the land between the Nerbudda and Tapti, and the Maharratt maharajahs, who were engaged in a war of extermination with the Nawanagar petty principality, had a close correspondence. Holkar was engaged in the war, and Scindia was engaged in the war with the Nawanagar. Holkar, another ambitious chief, who had long been at variance with Scindia, suddenly crossed the Nerbudda and marched with a large cavalry force on Poona, which he entered after defeated the combined army of Scindia and the Peishwa. The Peishwa, taking the capital, and putting himself under British protection, whilst Holkar placed one of his relations on the seat of power at Poona.

The Madras army, under Colonel-General Stuart, was on the top of the mountain of the Mahratta territory for a purpose of re-occupying the Peishwa, and Major-General Wellesley was appointed to command a select corps in advance, with which he marched rapidly upon Poona. Having received information on the road that Holkar's army had been defeated, he sent a detachment to Poona, with the cavalry, and, performing a march of 60 miles in 30 hours, reached Poona on the 20th of April, and thus saved the town. Holkar's people retired without fighting, and the following month the Peishwa, having received the news of affairs, which was yet more dangerous, at a moment when the peace of Amiens the French had just recovered their Indian possessions, the governor-general appointed General Wellesley to the chief command of all the British and allied troops serving in the territories of the Peishwa and the Nizam, with full power to direct all the political affairs of the British government in the same district. ('Dispatches,' Fort William, 26th and 27th of June, vol. ii.) The force was called 'The European Army,' and was composed of Europeans and natives, including the 19th Drogo-os, and the 74th Foot. After some fruitless negotiations with Scindia, General Wellesley marched from Poona to the north, and took by escalade the town of Ahmednagar, which was carried easily, and was followed by a pursuit, which advanced to the river Godavery, and entered Aurungabad on the 20th. The enemy manifested an intention to cross the river to the eastward and seal a march upon Hyderabad, but were prevented by General Wellesley marching along the left bank of the river, and placing himself between them and that city. On the 12th of September the British general was encamped 20 miles north of the Godavery. Colonel Stevenson, with the Nizam's auxiliary force, was at some distance, and not willing to march at once with a regular cavalry, avoided a general engagement, being afraid of British discipline, and only thought of carrying on a predatory warfare.

About the middle of September, General Wellesley learnt that Scindia had been reinforced by 16 battalions of infantry commanded by French officers, and a large train of artillery, and that the whole of his force was assembled near the banks of the small river Kainia. On the 21st of September the French and Scindian forces were engaged, and Colonel Stevenson, in whom the general was greatly interested, advanced Bod posture, but were still in camp at the distance of about six miles. General Wellesley determined to march upon the infantry, and engage it at once. He sent a messenger to
Colonel Stevenson, then about eight miles on his left, to inform him of his intention, and directing his advance. He had congratulated the British Light infantry, and the third regiment of native cavalry to reconnoitre. The infantry, consisting of two British and five native battalions, followed. After a march of about four miles he saw from an elevated plain not only the infantry, but the whole Mahatta force, consisting of nearly 80,000 men, encamped on the north side of the river Kistna; the right, consisting of cavalry, was about Bokerdou, and extended to their corps of infantry, which was encamped near the village of Assaye, with 80 pieces of artillery. General Wellesley determined on attacking the intrenched camp, and for that purpose he undertook the march, a ford beyond the enemy's left, and, leaving the Mysore and other irregular cavalry to watch that of the enemy, he crossed the river with his regular horse and infantry, and having secured the bridge which was formed by three lines, two of infantry, and the third of cavalry.

This was effected under a brisk cannonade from the enemy's guns. Scindia at the same time made a corresponding movement in his line, by giving a new front to his infantry, which was made to retire to the river Kistna, and its left upon the village of Assaye and the Juba stream. His numerous and well-served cannon did fearful execution among the British advancing lines. General Wellesley, seeing this, gave orders to abandon the artillery, and for the loss of the intrenched camp. The castanets were dropped, and the regiment, irresolute on the right and centre of the enemy; the British took possession of the guns, and the enemy's infantry gave way. But the British right suffered a very severe loss from the guns at the village of Assaye, and the enemy's cavalry, seeing the castanets in the enemy's hands, undertook the regiment, when Colonel Maxwell, with the 19th Dragoons, rode to its rescue, and drove back the assailants with great loss. The native infantry in the British service proceeding too far in the pursuit, many of the enemy's settlement, and his horse and infantry, as if they were dead, turned their pieces against the advancing infantry; and at the same time several of Scindia's battalions formed themselves again, thus placing the sepoy between his horse and infantry, and making it difficult for him to effect the same. In the course of the same year he left Calcutta for Madras, whence he was ordered to the Cape of Good Hope.

In February 1803 he again repaired to Madras, and obtained leave to return to England. About the same time his appointment by the king to be a Knight Companion of the Order of the Bath was made known in India, and published in the general orders; and in the following March the thanks of both Houses of Parliament to Major-General Wellesley, for his services, were likewise published in the public orders in India. On the 10th of March 1803 Sir Arthur Wellesley sailed from Madras.

General Sir Arthur Wellesley landed in England in September 1805. In November of the same year he was sent to Hanover in command of a brigade in the expedition under Lord Castlereagh, which was intended to make a diversion whilst the French army was engaged in the Danube against Austria and Russia. The tergiversation of the Prussian cabinet, and the disastrous battle of Austerlitz (December 1805), disconcerted the plans of the allies, and the English returned from Hanover to England in February 1806, without having seen any active service. Sir Arthur Wellesley was now appointed to the command of a brigade of infantry stationed at Hastings. In January 1806, when the news was received of the death of the Marquis of Cornwallis, he was appointed Governor of the British Settlements. On the 10th of April 1806, he married Lady Catherine Pakenham, third daughter of the Earl of Longford. In that year he was elected member for the borough of Rye, and from his seat in the House of Commons he defended the administration of Lord Castlereagh's policy, and supported him in his measures. In the same year he was appointed to a command in the expedition to Copenhagen, under Lord Castlereagh and Admiral Gambier. On the 23rd of August General Wellesley's division attacked the Danish troops at Kjøge, carried their entrenchments, and captured the enemy's magazine, with nearly 1200 prisoners. This was the only action of any importance which took place by land. The bombardment of Copenhagen having induced the Crown Prince of Denmark to listen to terms, General Wellesley was appointed
by Lord Cathcart, together with Lieutenant-Colonel Murray and Sir Home Popham, captain of the fleet, to draw up the articles of the capitulation, which were agreed to by the Danish government on the 7th of September, and by which the Danish fleet and naval stores were delivered to the British fleet. Sir W. Wellesley returned to England with the expedition, and resumed his duties as secretary for Ireland. In the following February (1808) he received in his place in the House of Commons, the thanks of that House for his important share in the success of the expedition; and he was deprived of the assistance of the Danish fleet, upon which he had reckoned in his plans against England.

In the spring of 1808 a military force was assembled at Cadiz in accordance with the general plan approved by Sir W. Wellesley, to inflict a severe blow to the Spanish colonies of South America, Spain being, through French influence, at war with England. But the invasion of Portugal and Spain by Napoleon, occurring about the same time, gave a new destination to the English expedition. The people of Spain declared against the invaders, and sent to England to ask for assistance. Juntas, or local governments, were formed, and peace was proclaimed between Spain and England. The main strength of the Spanish patriots appeared to be in the north, in the mountainous provinces of Asturias, Oviedo, and Guipuscoa, in the territories of the French, and the deputies who came to England from those provinces requested the employment of an English auxiliary force to effect a diversion by landing on some point of the coast and gallant Sir Arthur Wellesley was again sent to Spain. He had been promoted to the rank of Lieutenant-General, April 25, 1808, was appointed in the following June to the command of the force intended for the Peninsula, consisting of about 9000 infantry and a regiment of light dragoons, with the proviso that the Spanish should furnish a force of 10,000 men in short time. He formed altogether a respectable military force, but the importance of the occasion warranted exertions even greater than these, for the Spanish peninsula had now become the field on which the great question was to be decided whether France was to govern Europe, and dictate to other states, Great Britain included.

Sir Arthur Wellesley landed at Corunna July 20, 1808. The Junta of Galicia asked for nothing but arms and money. They desired the assistance of a British auxiliary force, but they advised General Wellesley to land in Portugal, to rescue that kingdom from the French grasp, and thus open a ready communication between the north and south of Spain. This was in accordance with Sir Arthur Wellesley's own views, and the general instructions that he had from home. He accordingly sailed to Oporto, which town had already risen against the French; and there he found the war-like bishop, who was at the head of the insurrection, and had gathered about 10,000 men, but unarmed and equipped. He also learned that 5000 Portuguese regular troops were stationed at Coimbra, on the Mondego. Having made arrangements with the bishop for the supply of mules and horses, General Wellesley sailed to the south as far as the mouth of the Mondego, but not venturing to land in that position of the French troops near Lisbon. On the 30th of July, he anchored in Mondego Bay, which he fixed upon for the landing of the expedition. The landing took place on the 1st of August, near the small town of Figueira, on the south bank of the Mondego. The number of troops landed was about 9000. On the 5th Major-General Spencer joined him from Cadiz with about 4000 more.

The French force in Portugal at the time, under Junot, consisted of over 20,000 men, from which deducting the garrisons of Almeida, Elvas, Peniche, Setubal, and other places, there remained about 14,000 men for the defence of Lisbon. Their communications were cut off from their countrymen in Spain, for, since the surrender of General Dupont, the Spanish patriots were masters of Andalucia and Estremadura, and in Old Castile the French troops under Bessières had not advanced westward further than Beavente, being observed by the Spanish army of Galicia. Although the French had 600 French and 3000 Portuguese regular troops, they were doomed to retire to the Ebro. A clear stage therefore was left for the contest in Portugal between Wellesley and Junot, whose respective disposable forces were nearly equal, the French, however, having the advantage of a considerable body of cavalry.

On the 9th of August the English began their march southward. The advanced guard entered the town of Leiria on the 10th, where it found the Portuguese force of 6000 men under General Freire, who, having appropriated to the wants of his men the stores which, by an agreement between the junta of Oporto and Sir Arthur Wellesley, were intended for the English, further demanded that his corps should henceforth be furnished with provisions by the Portuguese crown. Sir Arthur Wellesley declined to comply. Freire then refused to advance with the English, but remained behind at Leiria, and was with difficulty prevailed upon to allow about 1800 of his men to join Sir Arthur. They joined the French near 30th Caldas, following the road to Torres Vedras, which runs parallel to the sea-coast. It was near Rolica, about ten miles beyond Caldas, that the first engagement took place. But before relating the operations, it may be convenient to describe the position of the French in Portugal.

When the Spaniards had risen against the invaders, the spirit of resistance spread to Portugal, the natives of which country had equal motives for being dissatisfied with the French rule. The French had with their army several Spanish regiments, which were scattered about the country in the several garrisons. The Spanish troops which were at Oporto, forming the principal part of that garrison, hearing the news from Spain, revolted against the French commandant, seized the town with the few French soldiers that he had with him, and set off with their prisoners for Spain, leaving the Portuguese at liberty to act as they pleased. A junta was then formed, with the bishop at their head, and in a short time, with the help of the Highlands, the whole of the provinces north of the Douro rose against the French. The insurrection spread southward into Beira. In the south the people of Algarve rose, and those of Alemtejo followed their example, being supported by a body of French troops which had been sent to the south. This was the beginning of the insurrection in that quarter. The French General Loison, who had been sent to repress the insurgents in the north, was quickly recalled by Junot and sent into Alemtejo. He entered Évora after a desperate resistance on the part of the inhabitants, and the town was given up to indiscriminate massacre. General Margarão executed like vengeance at Leiria, sparing neither age nor sex. Similar successes took place at Guarda in the north, and at Beja and VilaViçosa in the south. In these battles, however, the French were also losing their own men daily, for the peasants were always hovering about their line of march, ready to cut off stragglers and intercept the communications. The whole king's army, observed Sir Arthur Wellesley, was one of his first lines of defence, and the officers have gone off to Brazil, and their arsenaux are pillaged or in the power of the enemy. Their revolt, under the circumstances in which it has taken place, is still more extraordinary than that of the Spanish nation. They have thrown off their duty, and have armed about 10,000 men, 9000 of arms, of which number 5000 are to march with me towards Lisbon, the remainder are employed in a distant blockade of Almeida, and in the protection of Oporto, which is now the seat of the government. The insurrection is general throughout Alemtejo and Algarve to the southward, and in Évora Douro e Minho, Trás-os-Montes, and Beira, to the northward; but for want of arms the people can do nothing against the enemy.

The commanding-in-chief, Junot, on the news of the landing of the English, determined to abandon the provinces, except the fortresses of Elvas and Almeida, and to collect his force in the neighbourhood of Lisbon. He sent a division of about 3000 men under De Laborde towards Leiria, to keep the English in check; and he ordered Loison, who had returned from his expedition into Alemtejo, and had crossed the Tagus at Abrantes, to join De Laborde at Leiria. But the rapid advance of the English troops overpowered them, and they were driven back by the French general into the town of Leiria, and now De Laborde determined to make a stand alone in the favourable position of Rolica, hoping every moment to see Loison appear on his right.

General Wellesley having having observed the French enemy's picquets from Obidos, marched on the 17th of August to attack De Laborde. He formed his army into three columns: the right consisting of Portuguese was ordered to make a demonstration on the enemy's left; the left to ascend the hills on the
mander-in-chief, landed in Maceia Bay, and assumed the command. In the course of the day General Kellerman appeared with the port of Junot to propose an armistice, preparatory to entering into a convention for the evacuation of Portugal by the French. The terms were discussed between General Kellerman and Sir Hew Dalrymple, who in the end directed General Wellesley to sign the armistice. Among the articles there was one which judged the terms of the final convention by stipulating that the French army should not "in any case" be considered as prisoners of war, and that all the individuals composing it should be carried to France with arms and baggage, and "their private property," or what nothing should be detained! This, of course, would include the church plate and other public and private property which the French had taken either at Lisbon or in various towns, which they had divided among themselves. General Wellesley did not "entirely approve of the manner in which the instrument was worded;" but the articles being laid before the commander-in-chief, were signed by him that same evening. The armistice however was made subject to the approbation of the Adjudir, Sir Charles Cotten; and as one article of it stipulated that the Russian fleet in the Tagus, under Admiral Suvaniv, should enjoy all the advantages of a neutral port, Sir Charles objected to this, and the article was accordingly altered. The British, however, are Russian admiral. On the 25th Sir Hew Dalrymple signified to Junot that the armistice would be at an end on the 28th at noon, unless a convention for the evacuation of Portugal was already in effect with the French. In the mean time the army had made a forward movement from Vimiero to Remalhal, near Torres Vedras, within the boundaries stipulated by the armistice. Sir John Moore had also arrived in Maceia Bay, and his troops were about landing. In consequence of this Sir John Moore, Sir Arthur Wellesley, the hon. John Hope, Lord Paget, and Mackenzie Fraser, to command respectively divisions of the army.

Sir Harry Burrard arrived in a frigate in Maceia Bay, near Vimiero, on the evening of the 20th, and General Wellesley immediately went on board, and reported to him the situation of the army, and his own intended plan of operations, which did not by any means accord with the plan of De Laborde and Loison. Sir John Moore had taken at Torres Vedras. By this measure he would oblige the French either to give battle or retreat to Lisbon under great disadvantages. Sir Harry Burrard however decided not to advance any farther till the arrival of the reinforcements under Sir John Moore. But the enemy in the meantime was bringing the question to a speedy issue.

Junot, having joined De Laborde and Loison at Torres Vedras with all his force, estimated at about 14,000 men, of whom 1600 were cavalry, attacked the English in the position of Vimiero early in the morning of the 21st of August. The principal attack was made upon the British centre and left, and was directed by De Laborde and Loison; who, for over six hours, of driving the English into the sea, which was close in their rear. The attack was made with great bravery and steadiness, but was as gallantly repulsed by the British; it was repeated by General Kellerman at the head of the French reserve, which was also repulsed; and the French, being charged with the bayonets, withdrew upon all points in confusion, leaving many prisoners, among them a general officer, and 14 cannon, with ammunition, etc., in the hands of the British. The loss of the French in killed and wounded was estimated at about 1800, and that of the British was 730. Sir Harry Burrard landed, and was present in the field during part of the engagement, but he declined assuming the command, or in any way interfering with the conduct of the Royal Legion, as he had decided towards the close of the action, when the French were seen retiring in confusion, General Wellesley wished to follow up his victory; General Ferguson on the left was actually gaining ground, and General Lake's division of the advance guard had made strong resistance. Torres Vedras they would have reached it before the French, who would have cut off from Lisbon, and perhaps obliged to fly down their arms. Such was Sir Arthur's view; but Sir Hew Dalrymple proposed to move any farther, especially on account of the superiority of the enemy's cavalry. General Ferguson was ordered to desist from pursuit, and the French officers were thus enabled to rally their men, and make good their retreat to Torres Vedras.

On the 24th of August Sir Hew Dalrymple, the com-
Sir Arthur Wellesley's employment in the Peninsula being now terminated, he resumed the duties of his office as Chief Secretary for Ireland, which he proceeded to discharge in the month of December. Parliament having re-assembled in January 1809, he returned to London to resume his seat in the House of Commons. On the 27th of January he received, through the Speaker, the thanks of the House for his distingushed services in Portugal, and in particular for his attempt to get the House of Lords passed resolutions to the same effect, which were communicated to Sir Arthur by the Lord Chancellor.

The year 1809—Napoleon, with an army of more than 300,000 men, marching through the Spanish lines and routed the troops, forced in person the strong pass of the Somosierra on the 30th of November, and four days afterwards was in possession of Madrid. Meantime, Sir John Moore, with a small force, had been sent against Sir John Moore, who had advanced into Salamanca as far as Salamanca. This movement was followed by the disastrous retreat of the small army under Sir John Moore, the battle of Corunna, January 16, 1809, in which the heroic commander was defeated and abandoned by his British force in the retreat to England. The French, following up their success, spread over Leon and Estremadura to the borders of Portugal, and Soult, having over-run Galicia, marched into the northern Portuguese provinces, and carried Oporto by storm against the small British force, which had been left in Portugal when Sir John Moore advanced into Spain. Wellington was then sent by Sir John Cradock for the defence of Lisbon. The unfavourable turn of affairs in Spain induced the Portuguese government to make another effort to save Portugal from invasion, the same to send an army to the Spaniards in their momentous struggle. Sir Arthur Wellesley, having previously resigned his office of Secretary for Ireland as well as his seat in parliament, was sent to Portugal, and was appointed chief confidant to the British troops in the Peninsula. He arrived at Lisbon April 22, 1809, with his staff. He was followed by reinforcements of infantry and several regiments of cavalry. These, together with the Portuguese regularly under General Beresford, whom the Prince Regent had appointed to the chief command of his army, enabled him to bring into the field a force of about 25,000 men, with which he marched at the end of April to dislodge Soult from Oporto, leaving a division under General Mackenzie on the Tagus, guarding the eastern frontiers of Portugal against the French. General Victor, who was stationed near Merida, in Spanish Estremadura, the army under General Wellesley, having assembled at Coimbra, moved on the 9th of May in the direction of Oporto, and drove back the French troops, which had advanced south of the Douro. On the 11th of May the English occupied the southern bank of that river opposite the city of Oporto. The French had destroyed the bridges and removed them to their own side, and Soult was preparing to retire leisurely by the coast to Galicia. General Wellesley sent a brigade under General Murray to pass the river about four miles above Oporto, whilst the brèche of Guards was directed to cross the river at the suburbs of Oporto. Soult's right flank was attacked, and the commander-in-chief was to attempt a passage in the centre by means of any boats that they could find. The Douro at that spot is very rapid, and nearly three hundred yards wide. About ten o'clock in the morning of the 16th of May, two boats having been discovered, General Faget with three companies of the Boifs crossed the river, and got possession of an unfinished building on the Oporto side, called the Seminaria. The town of Oporto was then approached, and Wellesley succeeded in attacking the Belgians, but, before they could dislodge the first party that landed, General Hill crossed with fresh troops, and, pressed by the British artillery from the southern bank, maintained the contested ground gallantly, until General Sherbrooks with the Guards crossed lower down into the very town of Oporto, amidst the acclamations of the inhabitants, and charged the French through the streets. Meanwhile the head of Murray's column, which had crossed at Aveiro, under General Grant, was about to make a retreat, which was effected in the greatest confusion. He left behind his sick and wounded and many prisoners, besides artillery and ammunition, and retired by Amarante with the view of passing into Spain through the Minho; but finding that Loime had about taken the bridge of Amarante, which was taken possession of by the Portuguese, he marched by Guimaraes, Braga, Sal-mouzdo, and Montalegre, into Galicia. In this disastrous retreat the French were obliged to leave in the remainder of the artillery and part of their baggage, and the road was covered with dead horses and men, and French soldiers, many of whom were put to death by the patriots before the advanced guard of the British could save them.

In a general visit of Oporto only 23 killed and 62 wounded. On asking of Sir John Moore Wellington issued a proclamation, strictly enjoining the inhabitants to respect the French wounded and prisoners, and he wrote to Marshal Soult to request him to send some French medical officers to take care of their sick and wounded, as he did not wish to use the Spanish hospitals.

The attention of Sir Arthur Wellesley was now turned towards Spain. It was necessary to strike a blow in the country, and the present occasion appeared favourable. The condition of the national cause of Spain had improved considerably. The country had been invaded, and the inhabitants had been led by Napoleon's generals individually and collectively in such a manner that it was impossible to do anything without a sufficient force, and the British were more and more animated. Sir Arthur Wellesley was sent to the Peninsula, acted by himself, and the warfare became complex and irregular. Marshal Victor, Duke of Belleisle, commanded the first corps in Estremadura, near the borders of Portugal, having about 36,000 men, of whom however not 18,000 were under arms. General Sebastiani commanded the fourth corps in La Mancha, which mustered about 20,000 men under arms. A division of reserve under Desilles stationed at Madrid, together with King Joseph's guards, amounted to about 16,000 men. Kellermann's division stationed in Old Castile and on the borders of Leon and Asturias, comprised about 10,000 more. All the above troops, amounting to about 60,000 disposable men, were considered to be immediately under King Joseph in the protection of Madrid and of Central Spain, and to act offensively in Andalucia and against Portugal by the Tagus and the Guadiana. Soult had a distinct command. He had mainly to occupy the northern provinces of Spain and to act through them against Portugal. He had about 12,000 men, consisting of 9,000 French troops and the second corps of the French army, which had about 9,000 men under arms; the fifth, or Mortier's corps, amounting to 16,000; and Ney, with the sixth corps as about 18,000. Soult's force in all was about 33,000 men, and the French soldiers in all were in a splendid state of health, the English advancing from Portugal were likely to be brought into collision. Besides these there were in Eastern Spain the third and seventh corps, making together about 600. men, under Buchet and Anguistrois, who were already employed in Aragon and Cataltias; and 80,000 men were
scattered in the various garrisons and lines of communication.

The fortresses and fortified towns in the hands of the French were: 1st, on the northern line, San Sebastian, Pamplona, Bilbao, Santona, Santander, Burgos, Leon, and Astorga; 2nd, on the central line, Loga, Zaragoza, Guadalupe, Toledo, Segovia, and Zamora; 3rd, Figueras, Roses, and Empuries on the Baltic coast. These places were not driven out of northern Portugal, had withdrawn from Galicia; and, following the same movement, completely evacuated that extensive province, including the forts of Vigo and Bilbao, and leaving more than 20,000 men behind. Between those two commanders led to the deliverance of Galicia; which was an important event in the war, for the French never regained that part of Spain.

Marshal Soult reached Zamora in the beginning of July, and invaded the eastern frontier of Portugal, where he arrived at Astorga. Victor was posted between the Tagus and the Guadiana, and his troops suffering much from malaria. Mortier, with the 35th corps, on the road from Zaragoza to the French, received orders from France to halt; and the Imperial Guards, which Napoleon had ordered to Spain, and which had arrived at Vittoria, were hurriedly ordered to march to the banks of the Danube. This was in consequence of the Austrian war, which had just broken out.

On July 15th, Soult was able to send 30,000 men to Portugal, and 10,000 more to the north-west frontier of Portugal, where he arrived at Astorga. Victor was posted between the Tagus and the Guadiana. This was the force with which General Wellesley had to co-operate in an advance from Portugal into Spain for the purpose of attacking Victor and attempting to reach Madrid. The French commander had been so far in advance in the Peninsula that he had not yet seen a Spanish army in the field, and he could have precisely noticed his defection and discipline. He however soon obtained that knowledge when he came in contact with Cuesta. But there was another reason for the French retreat, deriving from their want of obtaining provisions and means of transport for his army in Spain. His letters during the whole of this campaign were filled with painful details on this subject. The people, the local authorities, the generals, and the Junta, all seemed to be completely at a loss for obtaining provisions and means of transport for his army in Spain. His letters during the whole of this campaign were filled with painful details on this subject. The people, the local authorities, the generals, and the Junta, all seemed to be completely at a loss for obtaining provisions and means of transport for his army in Spain.

While Cuesta's army was engaged in the capital, the French, to whom the army of Portugal was added, could not take what they liked, and will take it, but they cannot even pay common necessities.

The British army entered Spain in the beginning of July by the road of Zarza in Majorca, and Coria, and the head-quarters were at Seville. The French army crossed the Tagus by the bridge of Almaraz, and the two armies made their junction on Oropesa on the 20th. Sir Robert Wilson, with the Lucastian Legion, one Portuguese and two Spanish battalions, moved on to Seville, about eight leagues from Madrid, threatening the rear of Victor's army, which was posted at Talavera de la Reina. On the 23rd the combined Spanish and British armies attacked Victor's outposts at Talavera, and drove them in. The enemy would have suffered more if Cuesta had not been absent from the field. The British columns were formed for the attack of the French position on the 23rd, as General Wellesley wished to attack Victor before he was joined by Sebasiani, but General Cuesta "contrived to lose the whole of the day, to the immense advantage of his disposition." (Dispatch to J. H. Frede, 24th of July, vol. iv., p. 592.) On the morning of the 24th Victor retired across the Alberche into St. Ollala on the Madrid road, and thence to Torrijos, where he was joined by General Joseph in person, attended by Marshal Jourdan with the Guards and the garrison of Madrid. General Cuesta, who now seemed eager for battle, although General Wellesley recommended him to be very cautious in his movement, which could then have been a corps cut off and driven into the Tagus, and killed him fallen back upon the British, on the Alberche. On the 27th General Wellesley, expecting to be attacked, took up his ground in the position of Talavera. The position of the English army was then becoming more critical, for Soult was rapidly advancing from Salamanca, by the Puerta de Bagos, upon Plencia, in the rear of the British. General Wellesley had charged Cuesta to guard the mountain-pass of Bagos, and had sent 500 men thither, a force which of course proved insufficient to arrest Soult's march. General Wellesley did not know that Ney had unexpectedly evacuated Galicia, and was also advancing from Astorga upon the British left. Mortier also, with the 35th corps, which was on the road to Portugal, moved forward, so that there were more than 80,000 fighting men of the enemy behind the mountains of Plencia, ready to act on the left flank and rear of the British, who had besides the 20,000 men left in his front, who did not exceed 80,000. There were a few more battalions on their march from Lisbon to join the army, but they did not arrive till after the battle. The Spanish army of Cuesta mustered about 25,000 men, such as they were. The Portuguese regular troops, in order to guard the north-east frontier of Portugal, towards Almeida. It had been previously agreed between General Wellesley, Cuesta, and the Spanish Supreme Junta, or Central Government, that General Venegas, who was at the head of the Spanish army of Andalusia, consisting of about 20,000 men, should march through La Mancha upon Madrid, whilst Wellesley and Cuesta were advancing by the valley of the Tagus. Venegas did advance through La Mancha, but it seems that the Junta did not authorize the movement of the Junta which had the effect of slackening his march; he however made his appearance at last towards Aranjuez and Toledo, and it was his approach on the 13th which induced King Joseph to engage Venegas and Cuesta, in order to save his capital. It was then evident that Madrid could not hold longer, Soult's arrival at Plencia would have obliged the English to retire precipitately. But King Joseph fearing that Venegas from the south, and Sir Robert Wilson, who, with the Lucastian Legion, was holding the town of the neighbourhood, would assuredly Madrid and seize the city and all the road to the reserves, &c., he and Marshal Victor determined to give battle to the Allies in front: for if they were defeated, Madrid could be easily protected. General Wellesley, perceiving the situation of the enemy, hesitated no longer, and his troops were well protected by a steep hill, which was the key of the whole position. The whole line extended in length about two miles.

On the 27th of July the French moved from St. Ollala, crossed the river Alberche, drove in the British outposts, and attacked the 4th corps, which had retired from the mountains back steadily across the plain into their assigned position in the line. Victor now attacked the British left, whilst the 4th corps made a demonstration against the Spaniards on the right, several thousands of whom, after discharging their fire, fled panic-struck to the rear, followed by their artillery, and creating the greatest confusion among the baggage retainers and mules, &c.; and it was with difficulty that Generals Wellesley and Cuesta prevented the rest of the Spanish troops from following the example. Luckily the position of the Spanish army was strong in front, and the French, not knowing exactly what was going on, made no further attack on that side; their efforts were directed against the British left, which they succeeded for a moment in turning, and they gained the summit of the hill of Alberche, and the hill, being ordered to that point with more troops, drove the French down after an obstinate struggle which lasted after dark, and in which the French lost about 1000 men, and the same night, the French renewed the attack on the hill on the British left, and were again repulsed after losing about 1500 men. After a pause of some hours the attack was renewed upon the whole British front. Heavy columns of French infantry of the British corps of the 4th of July, 1812, and 1813, Campbell, which joined the Spanish army, but were each time repulsed by the steady fire of the English; a Spanish cavalry regiment charging on their flank at the same time, they retired in disorder, after losing a number of men and 10 guns. In the mean time a French division, supported by two regiments of cavalry, again advanced to turn the British
battle having been fought a few days before. On the 2nd of August Sir Arthur Wellesley learnt that the enemy had been driven out of the town of Vitoria, and that a new division of Bussac's corps, which he estimated at only 15,000 men, and that his intention was to join Victor, he determined to encircle him before he could effect the junction: he therefore marched on the 3rd of August to Oropesa with the British army, leaving Sir John Moore, with the Portuguese, to pursue the French upon the road to Madrid. He had to encounter the obstacles of the Tagus, from the neighbourhood of Madrid to the frontiers of Portugal. King Joseph and Sebastian were at Illescas and Valdemoro, between Madrid and the Tagus, while the advanced posts of the French were at Becima and Santa Cruz. Vitoria was lower down on the right bank, at Maqueda, near the Alberche, watching Cuesta, who was at Talavera. General Wellesley was farther down, at Oropesa. Soulé was on the Tietar, on the road from Plasencia to Almaza. Berrondo, with 3,000 augues, was said to be moving farther west along the frontiers of Portugal. "The allies under Wellesley and Cuesta had the centre, being only one day's march adunder; but their force, when concentrated, was not more than 97,000 men. The French could not now break the combined forces excelled 90,000 men, of whom 53,000 were under Soulé; and this singular situation was made more remarkable by the ignorance in which all parties were as to the strength and position of their enemies. On the 4th, the French forced a bridge, and the 5th, they fought a desperate day against the action of the Portuguese corps of 4,000 men, were preparing to unite at Moscle, near Madrid; while Cuesta, equally alarmed at Victor, was retiring from Talavera. Sir Arthur Wellesley was supposed by King Joseph to be at the head of 25,000 men; and Sir John Moore, culminating in Soulé's weakness, was marred with 23,000 English and Spanish to engage 63,000 French; while Soulé, unable to ascertain the exact situation of either friends or enemies, and the first battle of its kind on the southern coast of Europe, this moment the fate of the Peninsula hung by a thread, which could not bear the weight of twenty-four hours; yet fortune so ordained that no irreparable disaster ensued." (Napier's History of the Peninsular War, i. x.)

In the evening of the 3rd of August, Sir Arthur Wellesley learned that Soulé's advanced posts were at Naval Moral, and consequently between him and the bridge of Almarza, on the Tagus, thus cutting his line of communication with Portugal. At the same time letters from Cuesta to general officer were forwarded from Vitoria, and that Soulé must be stronger than was supposed; and that therefore he, Cuesta, would quit Talavera that evening, and join the British at Oropesa. Sir Arthur immediately moved towards Cuesta, who had written urging Cuesta to return to Talavera, in order to cover the evacuation of the British hospitals from Talavera. But Cuesta was already on his march, and early on the morning of the 4th appeared near Oropesa. Sir Arthur by this time had learned from intercepted letters that Soulé's force was much stronger than he had supposed, though he could not gainsay its full strength. Cuesta's retreat would immediately bring the King and Victor upon him. He was placed between the mountains and the Tagus, with a French army advancing upon him on each flank; the retreat by Almarza was cut off; he had seen enough of Cuesta and the Spanish army not to rely upon them on a field of battle; and he could not, with 17,000 British, fatigued and in want of provisions, fight successfully two French armies, each much stronger than his own. His only remaining hope was the bridge of Arzobispo, below Talavera. By taking up a line of defence beyond that river he might keep open the road by Trujillo to Badajoz. This however must be done immediately, before the enemy could get the upper hand by the force of circumstance. He communicated his determination to Cuesta, who, according to his custom, opposed it: he wanted now to fight the French at Oropesa; but the English general told him sternly that he might do as he liked with his 10,000 and 4,000 men, but that he must not let a battle develop on and should move forthwith. Accordingly, on that morning, the 4th of August, the British army filed off to ards Arzobispo, where it crossed the river with its artillery, stores, and 3,000 wounded from Talavera, and took a position on the other side. Thus the British army was saved from impending disaster. Here ended the fighting campaign of the British for 1809.
Sir Arthur Wellesley now moved his head-quarters to Deleózas, and afterwards to Jativa, on the high road to Baza, in the rear-guard of the army. He had just learned that the bank of the Tagus had been abandoned by the French army in Spain, and the enemy was crossing the river. The bridge of Almaraz had already been broken by the Spaniards. Cuesta, following the British movement, passed to the south of the Tagus by the bridge of Arzobispo, joined the British, the French, who had discovered the ford, crossed the river on the 8th with a numerous cavalry, overpowered the Spanish rear-guard, and seized the guns. General Wellesley however caused the remainder of the Spanish artillery to be dragged to the mountains of Mesa d'Olive, a strong position where the British guided the retreating strong pass of Mirabete, facing the bridge of Almaraz. The line of defence of the Allies was thus re-established. Meanwhile King Joseph preached Mortier's corps, which had crossed the Tago at Arzobispo, to retire to the Mountains of Sierra Morena. Scarcely 2000 men remained, who had ags in advanced to Almonacid, near Toldeo. Marshal Ney, on the other side, whom Soult had directed to fortify the Tago below Almaraz, could not dis-cover the ford. Soult now proposed to march with his three corps by Coria and Abrantes, and reach Lisbon, by the right bank of the Tago, before the English; but Ney, Jourdan, and King Joseph opposed the plan, and soon afterwards a dispatch came from Napoleon, dated after the battle of V. de la H. from the Austrian army in Portugal. Carnot, at the same moment, forbidding further offensive operations till the reinforcement of the French army, which had made the Austrian troops at Mantua, and thus the termination of the Austrian war placed at his disposal should reach Spain.

The Emperor Napoleon now, to crush his enemies, trusted chiefly to his naval force on the western frontiers, in which he was cheaply as well as by means of the reconquest. The proportion of cavalry in his armies in Spain was beyond all precedent. Napoleon resolved to play a safe game. He had already 200,000 men m in Spain, and yet he did not think them enough. His generals had adopted the same views. "It is large, it was only, the strenuosity that you can form, that will succeed," thus wrote Soult to King Joseph before the battle of Talavera. It is worthy of remark that Sir Arthur Wellesley, writing about the same time, said that the French had only 12,000 men in large.

Soult's army now went into cantonments in Estremadura and Leon, near the borders of Portugal. Sebastián having defeated Venegas at Almonacid, drove him back upon the Sierra Morena. King Joseph was again residing quietly at Madrid.

In England, on the receipt of the news of the battle of Talavera, Sir Arthur Wellesley was raised to the peerage by the titles of Baron Duro and Viscount Wellington. The news of the line of the Guadiana. His chief motive was the neglect of the Spanish armies in supplying his army with provisions, and the absence of the troops of Portugal; and another reason was, the impossibility of cooperating with the undisciplined Spanish armies. Lord Wellington had contrived, notwithstanding Cuesta's neglect, to carry away 2000 sick and wounded from Talavera; the remaining 1500, whom he was obliged to leave there, he recommended earnestly to the French generals, Mortier and Kellerman, and his expectations were not deceived. Marshal Mortier in particular showed the utmost kindness to the British wounded, and would have attended to before his own men.

In October Lord Wellington repaired to Lisbon, and proceeded to reconnoitre the whole country in front of that capital, for it was then that he resolved on the construction of the celebrated lines of Torres Vedras, which enabled him to batter all the efforts of the French in the following year. We can only refer the reader to the 'Memorandum' which he wrote at Lisbon on the 20th of October for Lieutenant-Colonel Fletcher, of the Engineers, in which he clearly points out the double line of positions, the entrenchedments and redoubts, the number of men required at each post, &c., as if the whole were already in existence before his eyes. This paper, so remarkable considering the epoch and circumstances in which it was written, is the clear evidence of Wellington's sagacity, his penetration, and his fitness for command. (See 'Dispatches,' vol. v., pp. 234-39). Of his plan however nothing was said or even whispered at the time. He returned to his head-quarters at Badejo, where he made an excursion to Seville, where he conferred with his brother the Marquis Wellesley, who was then the British ambassador in Spain, and whom he accompanied to Cadiz. On the 11th of November he returned to his head-quarters at Hadda. At the same time another fatal blunder was committed by the French. The Duke of Angoulême, and the Duke of Orleans, with the little army of the Extreme brothers, Junta ordered the army of Andalucia, joined by the greater part of the army of Extremadura, to advance suddenly upon Madrid, and this without any previous communication with Wellington, or the King of Spain. The Duke of Angoulême, or, with the Duke of Parque and other Spanish commissioners, went to Granada, Venegas, the general of the army of Andalucia, had been super- eived by Areizaga, an inexperienced young officer, who was in favour with the Junta. Old Cuesta had also retired, and made their move with a very small army of Extremadura. These two armies, which constituted the principal regular forces of the Spanish, and which, posted within the line of the Tagus and along the range of the Sierra Morena, protect-ed, and might long have protected, the south of Spain, was moved into Estremadura, with nearly 50,000 men and 60 pieces of artillery, advanced into the plains of La Mancha, and was attacked on the 18th of November, in the open fields of Ocaña, by the two French corps of Soult and Sebastiani; and, although his men fought with sufficient courage, yet he was completely routed, with the loss of more than one-half of his army, and all his baggage- and artillery, with the exception of 15 guns. About the same time the Duke de Parque, with 9,000 Sarral army, was posted at Aragon, and a line of intrenchments along the Sierra Morena, against Kellerman, but he was beaten, and driven to the mountains of Peña de Francia. The French, north of the Tagus, were thus left at liberty to attack Ciudad Rodrigo and Caceres, "in a moment," thus Lord Wellington writes from Badajoz to the news from Lisbon, "I am cordially convinced that such a cause as this would be completely lost by the ignorance, preoccupation, and mismanagement of those to whose direction it was intrusted. I declare that, if they had prosecuted their two armies, or even one of them, the cause was safe. The French could have sent no reinforcements which could have been of any use; they would have been gained; the state of affairs would have improved daily; all the classes were in favour of the same cause, and had nothing, by any division on the continent, or by the growing discontent of the French themselves with the war, the French armies must have been driven out of Spain. But not a thing will answer except to fight great battles in places in which the defeat of the Spanish armies is es-tas as is the commencement of the battle. They will not credit the accounts I have repeatedly given them of the superior numbers even of the French; they will seek them out, and they find them in vain. I am only afraid now that I shall be too late to save Ciudad Rodrigo, the loss of which will secure for the French Old Castile, and will cut off all communication with the northern provinces, by the Castile, and all save them to the north-west.

Lord Wellington's cautious looks now were directed towards the north-east, for he foresaw that the storm would burst upon Portugal from that quarter. He accordingly retired from Spanish ground altogether into Portugal, and moving through Alemtejo with the mass of his army in December, crossed the Tago at Abrantes; and thence marching to the Mondego, fixed his head-quarters at Vise in January 1810, having his outposts along the frontiers of Spain towards Ciudad Rodrigo. He left General Hill's division south of the Tago to protect Alemtejo. In the mean time Beresford and Bencesfort were indefatigable in their endeavours to raise the Portuguese regular army to a state of efficiency in numbers, armament, and discipline. Campaign of 1810—The part of the campaign of 1809 General Wellesley had delivered Portugal from the French. By the campaign of the early part of 1809 he had again repelled a fresh invasion of the northern part of that kingdom. The subsequent Spanish campaign of the same year, which was undertaken with a view to assist the Spaniards in driving the French away from Castile and recovering Madrid, failed through want of good management on the part of the Spanish generals, and of discipline in the Spanish armies. The battle of Talavera, the battle fought by Wellington on Spanish ground, was a glorious result to the British army, but the result, and the British general was obliged to evacuate Spain. Fresh blunders on the part of the Spaniards led to the conquest of Andalucia by the French. The way in Spain then assumed the character of a partisan warfare, and Wellington saw that it would be in vain for the present to expect that...
Spain could make any adequate effort to shake off the French yoke. Portugal however was free, and Wellington thought that she might be preserved by means of a British force of 30,000 to 40,000 men, which he considered to be the effective strength of the army, in addition to the militia, even supposing the French should obtain possession of the remainder of the Peninsula. This he stated in a letter to Lord Castlereagh, written from Malplaquet, 25th March, 1809, some days before the retreat of Talavera. In that remarkable letter he gives his opinion, founded upon facts, of the utter inability of the Spanish armies, as they were then constituted, to keep the field against the French. The following passage, which concludes his letter, merits every military authority, and I really believe that much of this deficiency of numbers, composition, and discipline, is to be attributed to the existing government of Spain. They have attempted to govern the kingdom, in a state of revolution, by an adherence to old rules and forms, and by furnishing the troops with those poor resources under the system of terror, which first stopped the Allies; and that perseverance in the same system of applying every individual and every description of property to the service of the army, by force, has since conquered Europe. They have not only deprived their French subjects in Spain, as they did everywhere else, of that of taking possession by force or everything they wanted. They ordered rations at every town, and they arrested, shot, or hanged all who put any obstacle in their way. The English generals, the allies of Spain, could not do this.

Wellington's thoughts were now directed to the defence of Portugal, of the practicability of which he entertained little or no doubt. He did not mean that he should be able to make an effective resistance on the frontier of Portugal, for that is extensive, and is open on too many points, but that he could secure the capital and other strongholds, and the mountains and fastnesses, so as to maintain his hold and tire out the invaders. The question whether Portugal was worth defending at the enormous cost at which it would be necessary to defend it, he left for ministers at home to decide. As long as the British kept possession of Portugal the French tenure of Spain was insecure; and circumstances might, and indeed must, render Britain and Spain more and more dependent upon each other. Portugal could send out of Portugal to renew a regular war in Spain for the final expulsion of the French. Napoleon was well aware of this, and was anxious to expel the English from Portugal, for that country formed the position of support for all military operations against England, in the Peninsula. ("Dispatches," vol. i. p. 368.) The Portuguese in a body had confidence in the British nation and army, they were loyal to their prince, detested the French, and their troops had submitted to British discipline. Portugal was a sincere and tolerably decided ally of England, which Spain was not and could not be. In an official letter to Lord Liverpool, dated Badajoz, 14th of November, 1809, after he had given directions for fortifying the lines near Lisbon, Wellington stated that Portugal might be defended by a British effective force of 30,000 men, in aid of the whole military establishment of Portugal, consisting of about 45,000 regulars, which however were as yet far from effective. And in a confidential letter also to LordLiverpool, on the same date, he says—"I do not think the French will succeed in getting possession of Portugal with an army of 70,000 or even of 80,000 men, if they do not make the attack for two or three months, which I believe now to be impossible. I conceive not only that they may but will make the attack, and before they will succeed to the north of Spain. The centre of Spain, or old Castile, is already subdued. . . . My opinion is that the enemy have neither the means nor the intention of attacking Portugal; or, if they do, and will make the attempt, before they will succeed to the north of Spain. The French armies in Spain had received reinforce-ments during the winter from Germany, in one of which the division of Marshal Beresford, and Drouet, with two fresh corps, had entered Spain, followed by a part of Napoleon's imperial guard. Sir Kilkenny, and Lisbon with about 80,000 men, were in the course of march. And the French were preparing for an attack upon Portugal. As a prelude they had been joined by Astorga from the Spanishiards, and were making preparations for the siege of Ciudad Rodrigo, which was defended by a Spanish garrison.

However, the road of Spain, with Victor Mortier under his orders, and was busy in organizing his military resources and establishing his military command in Andalusia. There is a very interesting report by Souta de la Prada, at the end of August, 1809, which is given in the Appendix to Napoleon's Memoirs, and which shows the activity and administrative abilities of that commander, and, at the same time, the misunderstandings between him and the nominal King of Spain, Joseph Bonaparte, and his Spanish ministers. General Regueru in Extremadura, ready to co-operate with his comrade in the north in the invasion of Portugal by either bank of the Tagus. His movements were anxiously watched by Gérard Hill, with about 12,000 British and Portuguese, stationed at the mouth of the Tagus. Marshal Beresford, with his 30,000 men of Spain, Cadiz, by its situation, was garrisoned by British force, of about 7000 men, under General Graham, in addition to the Spanish troops; and the French, under Victor, were blockading the place. In the north, the Spanish army had crossed the Douro. Wellington did not consider the French army in Portugal in sufficient force to effect any powerful division. In the east of Spain, Valencia and Murcia still held out, by Catalonia was the only province in which the Spanish under O'Donnell and a part of the Spanish generals, but it is a regular system of warfare against the French. O'Donnell was assisted by the nature of the ground, which was impervious with numerous fortresses, and also by the British squadron along the coast, and by the organisation and activity of the inhabitants, which made the entrance of a large army impossible. The province was too remote to have any influence on the operations in Portugal and Andalusia. The conquest of Portugal was the great object of the French campaign of 1810. About the middle of May Marshal Masséna, Prince of Salm, arrived under an alliance with Napoleon to take the command of the army assembled in Old Castile and Leon, which assumed the name of the 'Army of Portugal.' He had also military command over the provinces of Catalonia, Aragon, and Murcia. Wellington, under Regueru, 6th corps under Ney, and 8th under Junot, and the reserve cavalry under Monbrun—total 72,000 men under arms for the field, besides garrisons, detachments, &c., in the provinces of Valladolid, Burgos, Guadalajara, and also Aragon, which, in the course of the campaign, the 9th corps, under Drouet, consisting of about 18,000 men. Lord Wellington had to oppose the whole of this force with about 54,000 British and Portuguese regulars. There was moreover a considerable number of Portuguese militia, employed mostly in the garrisons and in the provinces beyond the Duero, in Alemtejo and Algarve—short range, on the wings of the regular force. It must be observed also that Masséna could concentrate his whole force for his attack on Portugal north of the Tagus, whilst Lord Wellington was obliged to leave part of his force south of that river, to guard against any sudden movement from the French army of Andalusia, which was not 80,000 strong, of which a part might attempt to come into Alemtejo. Masséna's troops were mostly old and exhausted, inured to the service of the French, and of a very defective in organisation as not to be trusted in the open field. Marshal Beresford however had taken great care with the Portuguese regulars, many of the officers were English, and Lord Wellington had brigaded several of his regiments in Portugal. Early in June the French invested Ciudad Rodrigo about in sight of the British advanced division, which was posted on the Támesis. On the 28th they opened their batteries on the Spanish governor, a brave old officer, defended till the 10th of July, when, a practicable breach was made.
The French entered the place by capitulation. Wellington could not risk his army for the relief of Ciudad Rodrigo; his object was to defend Portugal, and, above all, Lisbon. He states in the clearest manner his reasons for not attempting to relieve Ciudad Rodrigo in his dispatch to Lord Stratford. He had, he says, been informed that the enemy was about to make a descent on his army to the valley of the Mondego. Another considerable force occurred in Massena's movements, but on the 16th of September the French army began their march down the valley of the Mondego via Coimbra, through Viseu. "There is certainly," Lord Wellington observed, "many bad roads in Portugal, but the enemy has taken decidedly the worst in the whole kingdom." Wellington, who had retired by the left bank, then crossed the river, and took up a strong position from a hill along a high ridge called the Serra de Busaco, which extends from the Mondego northwards. General Hill joined Wellington with his division from the south, leaving some troops on the left bank of the Mondego to secure the high road to Lisbon on that side. With this exception Lord Wellington's whole army was collected upon the Serra de Busaco. On the 26th of September the French army, consisting of the 2nd, 6th, and 8th corps, assembled before it, took place. On the 27th the French attacked in great force both the right and the left of the English position; one French column reached the top of the ridge, and was in the act of deploying when it was repulsed by General Picton's division, as well as another attack on the right. And on the left the French were likewise repulsed and thrown down the hill by a charge of the bayonet from Cranfield's division and a Portuguese brigade. The French lost one general and about 1000 killed, two generals and about 5000 wounded, and one general and several hundred men prisoners. The loss of the Allies did not exceed 1300. "This movement," says Wellington, "has brought the Portuguese levies into action with the enemy for the first time in an actual situation of circumstances; it is evident that the trouble which has been taken with them has not been thrown away, and that they are worthy of contending in the same ranks with British troops in this interesting cause, which they afford the best hopes of saving." (Dispatches, vi. p. 478.)

One of the motives of Lord Wellington in fighting the battle of Busaco was to give time to the population of the country in his rear to remove out of way of the enemy with their goods and provisions, especially from Coimbra, which was then taken, but so much wounded, that the effect were ill obeyed. Massena did not attempt again to force the position of Busaco, but moved off his army by the pass of Buialva, in the mountains north of Busaco. Lord Wellington had directed Colonel Trant to occupy this pass with the Portuguese; but Trant did not arrive till too late and too small a force, the French cavalry was hovering on the flank and rear of the British, which gave the French a free hand. The French entered the forsaken city, where they found ample stores of provisions.

On the 29th of September the Allies quitted the position of Busaco, and, crossing the Moumgue, began their retreat towards Lisbon. On the 1st of October the British rear-guard, after some skirmishing with the French, evacuated Coimbra, accompanied by all the remaining inhabitants, who ran away with whatever moveables they could carry, and the sick, the aged, and the children, on carts, mules, and donkeys, not knowing whither they were going, and encumbering the road, whilst the British cavalry was hovering on the flank and rear of the French. The French entered the city of Coimbra, which fell very quietly, and occupied it without resistance.
On the 10th of October the whole army was within the lines. The line of defence was double. The first, which was 29 miles long, began at Alhendra on the Tagus, crossed the valley of Aruda, which was rather a weak point, and passed along the east bank of the Tagus near Alcacer do Sal. Then there was a longer and strong redoubt; it then passed across the valley of Ziberdeira and skirted the ravine of Runa to the heights of Torres Vedras, which were well fortified; thence the line followed the course of the little river Zindare to its mouth on the northern bank of the Tagus. The second line was a parallel line between the sinuosities of the mountain tract which extends from the Tagus to the sea about 30 miles north of Lisbon. Lord Wellington's head-quarters were fixed at Perao Negro, a little to the north of the centre of the second line, and the selection of this post was fixed corresponding with every part of the position. The second line, at a distance varying from six to ten miles in the rear of the first, extended from Quintella on the Tagus, by Bucelas, Monte Cisande, and Mafra, to the mouth of the little river St. Lourenço on the sea-coast, and was 24 miles long. This was the stronger line of the two both by nature and art, and, if the first line were forced by the enemy, the retreat of the army upon the second was secure at all times. The second line was secured by barriers, and stockades with loopholed posts. In the rear of the second line there was a line to secure the embarkation of the troops, should that measure become necessary, enclosing an entrenched camp and the Fort of St. Julian. More than 100,000 and 600,000 of the army were scattered along these lines. Lord Wellington had received reinforcements from England and Cadiz; the Portuguese army had also been strengthened, and the Spanish division of La Romanía, 50,000 strong, came from Estremadura to join the army of Lord Wellington, and 40,000 Spaniards and 60,000 regular troops posted along the first and second lines (Dispatch to Lord Liverpool, vol. vi. p. 585), besides the Portuguese militia and artillery which manned the forts and redoubts and garrisoned Lisbon, and the English marines which occupied the line of embarkation, a powerful fleet in the Tagus, and a flotilla of gun-boats flanking the right of the British line. Altogether these lines of defence were of stupendous strength, conceived by the military genius of Lord Wellington, and executed by the military skill of the British engineer officers.

Massena seems to have been taken by surprise at the sight of the lines, and he employed several days in reconnoitering them. He made some demonstrations in order to make the British divisions show out their force; but after one or two slight attacks, which were repulsed, he made no further attempt. He put the second and eighth corps partly in the villages and partly in bivouacs in front of the right and centre of the line of Sedan, leaving only two or three ottas in his rear. He established his depot and hospitals, and commenced forming magazines at Santarem, and for this purpose sent moveable columns to scour the country for provisions, for he had entered Portugal without magazines, every man having brought a certain number of days' provisions; he had even thrown away or wasted on the road. The country had been partly stripped by the inhabitants, who had retired to the mountains or within the lines, and the French foraging parties destroyed what was left, so that for many leagues in rear of the French the country became a scene of devastation and almost a desert. In addition to this, the Portuguese militia under Trant, Millar, and Wilson, came down from the north and cut off all communication between Massena's army and the Spanish frontier. Wellington was in march for Lisbon, as they thought, Colonel Trant surprised Coimbra, seized many prisoners, and all the sick and wounded, between four and five thousand in number, whom he removed to Oporto. Trant and Wilson came down towards Ourem, Thomar, and the banks of the Zêzere, keeping an eye upon Massena, who was obliged to move back a whole division to hold them in check. Towards the end of October, Massena sent 2000 men along the Mount Abrantes, in a communication with Spain by the way of Castello Branco; a few volunteers were sent to Coimbra in a strong escort by the way of Penamacor to Ciudad Rodrigo, whence he hastened to Paris to inform Napoleon of the real state of affairs in Portugal.

Massena made up his mind to throw all his army into the fight. He attacked Oporto with 70,000 men, of whom 18,000 had been either killed or taken prisoners were in the hospitals; his army became very sickly in consequence of privations and of being exposed to inclement weather mostly without shelter, and bivouacking in low grounds. On the 15th of November he began a retrograde movement, with great order and caution, for the purpose of placing his army in cantonments for the winter. On the 17th the French second corps was established at and near Santarem, in a very strong position; the eighth corps at Pernas; and the sixth corps at Thomar, farther in the rear. Massena was in the opinion of the Radetsky's corps, light divisions and cavalry followed the French movements and took some prisoners, but nothing of importance occurred. Lord Wellington, leaving part of his troops in the lines, moved forward the remainder towards the Rio Mayor, which separated the two armies, and when his whole division was placed on the left bank of the Tagus, opposite Santarem. Wellington's head-quarters were fixed at Cartaxo. Both armies were now in cantonments for the winter. Thus ended the campaign of 1810. As a defensive campaign on the part of Lord Wellington it was successful, for the French army at the end of that year held no other ground in Portugal than that on which its divisions stood, being hemmed in between the northern bank of the Tagus, the Rio Mayor, and the French regular forces on its left flank, and the Portuguese militia on its rear, and its communications with Spain intercepted.

All the north of Portugal was free from the French, and also the whole of the kingdom south of the Tagus, and the place of its main army in cantonments for the winter. Oporto, Coimbra, Abrantes, were in possession of the Allies, as well as all the fortresses, with the exception of Almeida. As the French had advanced by the valley of the Mondego and the country west of the Serra da Estrela, the people of that country hadElementType="Strong"> cast off the provisions carried on the French army and carried off the provisions; but the population east of the mountains, and between them, the Tagus, and the Zêzere, had remained in fancied security, so that, when Massena with drew his army and began the retreat towards the towns of Thomar, Pernas, Torre Nova, and Golegão inhabited and untouched. The corn-mills, little injured, were quickly repaired; cattle and corn were procured in abundance, especially from the fine plains of Golegão, which supplied them with Indian corn, and the French thus obtained provisions during the whole part of the winter. And, what was worse for the Allies, a number of boats were left behind at Santarem on the right bank of the Tagus, by means of which the French had the power of crossing the river whenever they liked. This annoyed Lord Wellington more than anything else, and he expressed himself strongly concerning the remissness of the Portuguese Regency in neglecting to give or not enforcing the necessary orders for removing everything out of the reach of the French and for destroying what remained behind. But the French could not have stayed if the provisions had been removed. . . . All our military arrangements are useless if they can find subsistence on the ground which they occupy. . . . Then the boats are left at Santarem in order to give the enemy the power of crossing the river whenever they like. . . . Breaking to contemplate the chance of failure from such obstinacy and folly." (Dispatches to Charles Stuart, the English Ambassador to the Portuguese Regency, October 16 and 18, and November 1.)

The puerile spirit of the Portuguese Regency had manifested itself ever since the fall of Almeida. There was a faction in the Regency, at the head of which was the Patriarch (former Bishop of Oporto), who wanted to control the army in the name of the King. Wellington did not want the French to break the line of communication from Lisbon to Oporto, which would not allow him to be directed by them, they thwarted him in every way. In a remarkable letter addressed to Mr. Stuart from Ovoue, September 7, Lord Wellington had denounced their practices:—"In order to put an end at once to these miserable intrigues, I beg you to inform the Portuguese Government that I will not stay in the country, and that I shall advise the King's Government to withdraw the assistance which his Majesty affords them, if they interfere in any manner with the appointments of Marshal Beresford, and with the arrangements of the army; or with any of the points which, under the original arrangement with Marshal Beresford, were referred exclusively to his management. I propose also to adopt the same course of procedure if the Portuguese Government refuse or delay to adopt the civil and political arrangements recommended by me, and corresponding with
the military operations which I am carrying on. But it appears that the Portuguese Government have lately discovered that we are all wrong; they have become impatient for the defeat of the enemy, and, in imitation of the Central Junta of Spain, call out for a battle and early success.

YOUR MOST OBEDIENT SERVANT, Lord Wellington says—"You will do me the favour to inform the Regency, and above all the Principal Sousa, that, his Majesty and the Prince Regent, having intrusted me with the command of their armies, and I hereby become so great a man that I will not suffer them, or anybody else, to interfere with them; that I know best where to station my troops and when to make a stand against the enemy; and I shall not alter a system formed upon mature consideration upon any suggestion of yours. If the fortifications are carried away, I am to follow, and I recommend them to look to the measures for which they are responsible, and which I long ago recommended to them, viz. to provide for the tranquility of Lisbon, and for the food of their own army and of the people, while the army can be engaged with the enemy. As for Principal Sousa, I beg you to tell him from me that I have had no satisfaction in transacting the business of his country since he has been a member of the government; that, being embarked in a course of military operations, of which I hope to see the completion of within a month from the 1st of March, I end, but that no power on earth shall induce me to remain in the Peninsula for one moment after I shall have obtained his Majesty's leave to resign my charge, if Principal Sousa is to be the judge hereafter of my conduct.

Either he must quit the country or I will; and if I should be obliged to go, I will take care that the world, or Portugal at least and the Prince Regent, shall be made acquainted with my reasons. . . . I have but little doubt of my success, though the extent of the military gain I shall not know till the end of the campaign, and I cannot make the battles to know that the result of any one is not certain, even with the best arrangements, I am anxious that the Government should adopt preparatory arrangements, and take out of the enemy's way those persons and their families who are in the rear of the troops, and that the removal of this correspondence is absolutely necessary to enable a person to form a just idea of the difficulties which Lord Wellington had to contend with, and of the strength of mind which enabled him to rise superior to them.

Campaign of 1811. During the months of January and February the armies in Portugal remained in the same relative positions. The low lands being flooded rendered field operations impossible. Meanwhile the 9th corps under Beresford had entered Portugal by the valley of the Mondego, with the object of reinforcing Massena's army. By this movement the rear of Massena's army was to be protected, and the army on the Tagus was to be reinforced. Soult, on the other hand, had entered Portugal by the valley of the Douro, with the object of cutting off the army of Soult and Massena. At the same time Soult, who commanded the army of Andalucia, received orders from Napoleon to act in concert with the army of Portugal, which was rendezvoused at the town of Odemira, where a new French army was formed in the north of Spain, consisting of about 70,000 men, and placed under Marshal Belleissie, duke of Istria, who was ordered to support and furnish all necessary assistance to the army of Portugal. Letter from Beresford, Prince of Wagram, to the Prince of Espling (Massena), Paris, January 16, 1811; another from the same to Duke of Dalmatia (Soult), January 24, 1811; and another from the same to Prince of Espling, February 7, 1811; in Appendix to Napier, vol. iii. 14.a Make a bridge over the Tagus at Marchmont, and send a force to meet you. The Tagus form a junction. Meantime keep the English in check, and make them lose men every day by engagements of the advanced guards. Their army is small, and they cannot lose many men. Besides, people in London are much alarmed about the idea of crossing the Tagus, and when the season becomes favourable let the main operations be carried on south of the Tagus.

Such were the gigantic efforts made by the master of half of Europe. For months on end, every foggy morning, few men only in the beginning of March. But all Napoleon's efforts did not prevail. Massena was waiting for Soult to appear on the left bank of the Tagus opposite to his position, but Soult was obliged to maintain the blockade of Cadiz, in which there was a British garrison of 6000 men; he was obliged to leave Sebastiana on the side of Granada and Murcia to keep in check the Spanish armed parties; and he could not therefore dispose of more than 20,000 men, with whom he dared not enter Alentejo, leaving the Spanish fortress of Badajoz in his rear. He therefore began by attacking the fortress of Olivenza, which he took January 25, and then marched to Badajoz. On the 19th of February he defeated a Spanish force of nearly 12,000 men under General Castaño y Branco, which was posted on the river Góebra, an affluent of the Guadiana, and then commenced the siege of Badajoz.

In the mean time Massena remained in his position at Santarem, waiting for Soult's appearance on the Tagus, till he became sure of his rear. He delayed no longer. All the means of collecting provocations by violence were exhausted, large moveable columns had been sent at different times both on the side of Castel Branco and on that of the Mondego, which scourcd the country and changed with every militiaman, even the thin excesses, which were retaliated by the infuriated peasantry upon the French stragglers and wounded. The discipline of the army was broken by this barbarous system of warfare. They had no less than 10,000 sick; they could obtain no provisions, the French were again in full retreat through the provinces long; and would serve the troops during their retreat to the frontiers.

In the beginning of March Massena moved his sick and baggage by degrees to the rear, and after demonstrations in various directions the divisions of his army filed off in the quiet of night, Santarem was recaptured, and the retreat took place on the 6th of March, and next morning it was entered by the English. Massena however had gained two days' march, and his army was not overtaken by the English till the 8th of March, when they joined forces near the village of Pombal, presenting a front of resistance. There was some skirmishing with the light division, whilst Wellington brought up his other divisions, but the French having gained time for their baggage to file off, retreated on the 11th to the rear. The detachments of the English, which were driven by the castle of Pombal was driven away with some loss by the English, and in the night Massena continued his retreat. On the 12th the English advance found N ey with the French rear-guard posted on a high table-land in front of the village of Redinha, but the French skirmishing before them of the English and the French seemed disposed to stand their ground, and made a show of considerable force, Lord Wellington formed his army in line and moved on to the attack, when, after a general discharge from the French batteries, which hit them in crowds; the French were again in full retreat through the village, and joined that evening the main body at Condeixa, where one road leads to Coimbra and another ascends the valley of the Mondego. Massena's intention was to seize Coimbra and, if possible, Oporto, in order to form a line of retreat, and to continue the line of the Mondego, which was fordable in many places, and retire across the Douro, removing all the boats. Coimbra was thus necessarily left to a surprise by the French retreat army. But it luckily happened that Trant lingered behind at Coimbra with a small force, and, having destroyed one arch of the bridge, and placed guards at the fords, he determined to defend the town, thinking that, if he could carry a sudden assault, Massena could not stay long on the left bank of the Mondego with the allied army at his heels. On the 11th of March Monbrun appeared at the suburb of Oporto, and on the 12th made an attempt to force the bridge, but his men were repulsed by grape-shot. Monbrun fancied that Trant had been reinforced with some English regiments by sea, and having made his report, Massena relinquished the idea of continuing his retreat, and turned upon Coimbra by Ponte de Murcelda and the left bank of the Mondego. Thus Coimbra was saved from the impending visitation.

Massena resumed his retreat on the 13th of March in order to follow the British army, which he had left turned by Picton's division, which had marched by a path over the mountains of Anciolo. Ney, in command of the rear-guard, set fire to the town of Condeixa, in order to stop the British artillery, but the light division pursued the retreating enemy, and penetrated into the same, and under the town of Mondego, until night stopped any further pursuit. By the aid of darkness the French got together again, and on the morning of the 14th, when the fog which enveloped the mountains began to clear off, Ney was seen posted on a hill near Casal Nova. The light division attacked him; and Picton's division's
of beasts of burden to be destroyed. The inhuman fellow charged with the execution harried 500 assed, and left them to starve, and thus they were found by the British troops. The lines of the road were thus rendered difficult and griefer visible in these poor creatures' looks wonderfully roused the fury of our soldiers, and so little weight has reason with the multitude when opposed by a momentary sensation. General Lord Wellington, habitually sober in the expression of his sentiments, assumes even a more decided and indignant tone on the same occasion. In his official dispatch to Lord Liverpool, dated March 14, after detailing the movements of the French to that day, he thus continues: "I am duty bound to add to this account that their conduct throughout this retreat has been marked by a barbarity seldom equalled, and never surpassed. Even in the towns of Torres Novas, Thamar, and Fornos, in which the head-quarters of some of the army—rear-guard—were established, and the French commander-in-chief, in which he told the inhabitants of Portugal that he was not come to make war upon them, but, with a powerful army of 110,000 men, to drive the English into the sea." (Dispatches, vol. viii., p. 306)

On the 26th of March the French abandoned Celorico, but retained the position of Guards. On the 29th however Lord Wellington moved his columns up the steep hill of Guards, when the French retreated to the Coa, without firing a shot—the rear-guard in excess of 7,000, and the 2nd of April the British army came up with them, and found them posted on the right bank of the Coa. On the 3rd the light division passed the Coa on the left of the French, and drove in their light infantry; but the main body of the French advanced, and succeeded in crossing the Coa, and the other of the light division could not see that they were pushing too far. When the weather cleared up, the French, seeing that only a small force had crossed the river, attacked it in columns with cavalry. Three times the 43rd and 54th regiments were driven back with us, but they rallied and beat back the enemy. At last, Pieton's division having crossed the Coa, and the 5th division also making its appearance by the bridge of Sabugal, the whole French army retired upon Alveias, having sustained considerable loss in men and also in horses. This ended the combat of Sabugal, in which the light division lost about 200 men. On the 4th the French were about Aldeia da Ponte and Aldeia Velha, on the extreme frontier of Portugal, and on the 6th they crossed the Minho, which the bugles of the third and last French invasion of Portugal. They left a garrison in Almeida, which was blockaded by the English. "The enemy's loss in this expedition to Portugal is immense—I should think not less than 45,000 men, including the whole class of cavalry; excellent regulars, and the 2nd corps, they may have now 40,000 men on this frontier." (Dispatches to Lord Liverpool, April 9, 1811). A great part of the loss of the French, in killed, was from the hands of the Portuguese peasantry, who revenged themselves for the injuries which had been inflicted on their countrymen during the six or seven months that the French had remained in Portugal, by killing every straggler whom they could lay their hands upon before the British columns came up. Dismal scenes of suffering and death presented themselves along the whole line of retreat. The dead were left in an unburied state, generally naked, arms broken down on the road, carcasses of horses and mules. Some of the poor creatures seemed to have
rawled or been dragged out of the road to die beneath the stone walls with which the fields are enclosed; and, on looking over the stone walls into the fields, they were seen lying in clusters of three or four or more, in all sorts of positions. Portuguese villagers, men and women, were occasionally seen Morto de Batalhão, who had been in command, des and Frenchmen on the road, when they were properly reprovéd and driven away by a British non-commissioned officer. It was chiefly in the mountain ranges of the Serra de Estrela that the work of destruction had been carried on by the French and their allies, who, having been in possession of this valesse of Portugal in the beginning of the year, had been forced to retire before the winter. The males were soon despatched—the females paraded for a time, but not in mercy. It happened however it times that these marauding parties were small, and they were captured by the peasantry, who gave no quarter.

The orders given by the Regency of Portugal at Lord Wellington's request, for the people of Beira and Estremadura to withdraw from the open country upon the advance of the enemy, had caused a vast influx of population within the lines of their defences. When it was announced that the army was partly by their own countrymen, and partly by a gift of £0,000, voted by the British Parliament, and by subscriptions raised in England. After the retreat of Massena they returned to their homes, when the poorer class received ưured, enduring the remainder of that year and the following winter.

Lord Wellington having placed his army in cantonments between the Coa and the Agueda, and made arrangements for the blockade of Almeida, set out for the south to see the lines of the enemy, and was accompanied by all the alié soldiers. The French General Mercier, having been utterly defeated by the British in the preceding February, had invested the entire town of Almeida, and was at this time commanded by a general of his own military character. Lord Wellington could muster no more than 32,000 men, of which force only 1900 were cavalry. He however determined to fight rather than give up the blockade of Almeida. He drew back his army to the north of the town, and then directed a detachment of an extended line on a table-land between the two parallel rivers Tunores and Des Casas, which are affluent of the Agueda; his left on Fort Conception, covering the blockade of Almeida, and his right at Fuente de Oiio, extending towards Nava d' Aver, on the road to Sabugal, the whole distance being nearly seven miles. He had the Coa in his rear, with the bridge of Castello Born in case of a retreat. The front of the British position was protected by a defensive line of trellis-work passing through a deep ravine, in which lay the village of Fuentes de Oiio; but to the right of this village the table-land turned back towards the Tunores, leaving a plain between it and the hill of Nava d' Aver. The French advanced in three columns, which took different routes, one of which overhanging the village of Fuentes de Oiio, and nearly parallel to that occupied by the Allies. They then attacked the village, which was stoutly defended by the British. The French in one time took possession of part of it, but were charged and driven away by a fresh brigade of British infantry. Night put an end to the fighting. The Allies lost about 300 men, and the French somewhat more. The next day, Massena, who had been joined by Besières with a body of the Imperial Guards, re-entered the position of the Allies; and on the 9th of May he made a grand attack with the greater part of his force on the British right, which he expected to turn by the plain which extends between the hill of Fuentes de Oiio and that of Nava d' Aver, and then pass through the Tunores, and drive the British, which last stream flowed in the rear of the British position. Had they passed the Tunores, the French would have spread into the open country about Frenada, and cut off the English from the Coa. The French, crossing the Des Casas at the foot of the hill, passed through a ravine called No Velho, and drove him from Nava d' Aver; they then charged the 7th and light divisions, which formed the British right. The light division immediately formed into squares; but the numerous French cavalry fell upon the 7th division before it could effect a like formation, and came on with great firm; and although some were cut down, the enemy was checked by the steady fire of the Chasseurs Britanniques, a foreign regiment in the British service, and of other regiments of the 7th division. Lord Wellington however, considering his position too far extended to the right, gave

5 D
The total loss of the French was 230 killed, 1254 wounded, and 324 missing or taken prisoners. The losses of the French in the battles of Fuentes de Oñoro, Cañada de Meza and Almeida were thus very great. The number of dead bodies found in the village. No fighting of any consequence occurred on the left of the British position, where the fifth and sixth divisions were posted to protect the blockade of Almeida, but the wrath of the French was a result of the issue of the battle at Fuentes de Oñoro, and watching for an opportunity of throwing provisions into Almeida, which however did not occur. The battle of Fuentes de Oñoro was of importance, being a regular pitched battle fought by the Spanish in a position of some strength. The French were very weak in one point, under great disadvantage of numbers, and especially of cavalry. The great majority of the troops engaged were British, for the Portuguese were mostly with Marshal Beresford in the south. There were only four regiments of Portuguese on the left of the French, and these were cavalry engaged against three French corps of infantry and 5000 cavalry. Massena fought the battle for the purpose of relieving Almeida, but he failed, and Almeida a few days afterwards was evacuated by the French garrison in the town. Beresford directed his batteries to close on the quarter, and withdrew his army beyond the Aguada, and soon afterwards Marshal Marmont, duke of Ragusa, arrived at Salamanca to supersede him. The order of Napoleon by which Massena was directed to give up the command to Marmont was delivered to Beresford, and it was allowed to take with him to France his son and one of his aides-de-camp only. Marmont was told to take the reins of command with a firm hand. (Napier, “Peninsular War,” vol. ii, p. 220.)

While these things were happening in the north, Marshal Beresford had invested Badajoz, when Soult marched from Seville to relieve that place. On the 13th of May, Beresford raised the siege, removed his artillery, platforms, and stores, and took position on the west bank of the Guadiana River. Soult with above 7000 British infantry, several Portuguese brigades, and Blake’s Spanish corps, in all about 30,000 infantry and about 2000 cavalry, but hardly one-half of this force could be depended upon in the field. He had with him 4000 horses, most of which belonged to the cavalry, and more than 100,000 in the baggage. Soult came up with about 19,000 chosen infantry, about 4000 cavalry, and fifty guns. He immediately reconnoitred Beresford’s position, and determined upon an attack on the right flank of the Allies, which was their weak point, though Soult was not aware that Blake had placed his British troops. It was on the French part the same game as at the battles of Talavera and Fuentes; but Wellington was not there, nor were British cavalry at his back. Blake’s division was in the field, and Soult accustomed to the desultory fighting of light troops, they were pierced and divided: two companies of the 79th were taken, Colonel Cameron was mortally wounded, and the lower part of the town was carried: the upper part however was stiffly held, and the rolling of the musketry was incessant. Had the attack been made earlier, and the whole of Drouet’s division thrown boldly into the fight, while the 6th corps, moving through the wood, closed upon the village, the passage must have been forced, and the left of the French would have been dislocated. Warren, having all his reserves in hand, detached considerable masses to the support of the regiments in Fuentes. The French continued also to reinforce their troops, until the whole of the 6th corps and a part of Drouet’s division were engaged, when several batteries were opened. At one time the fighting was on the banks of the stream, and amongst the lower houses; at another upon the lower heights and round the chapel, and some of the enemy’s skirmishers even penetrated close to the town towards the main position but the village was never entirely abandoned by its defenders; and in a charge of the 71st, 79th, and 88th regiments, led by Colonel McFinnon, against a heavy mass which had gained the chapel eminence, a great number of French fell. In this manner the fight lasted until evening, when the lower part of the town was abandoned by both parties—the British maintaining the chapel and crows, and the French retiring a cannon-shot from the stream. (‘History of the Peninsular War,’ iii. 514-16.)
front column, and what remained of Houghton's brigade could no longer maintain its position. The ground was
heaped with dead bodies, and the Polish lancers were riding furiously about, causing the artillery on the upper part of
the hill. General Cole at the head of the lancers, flanked by a battalion of the Portuguese Legio and a heavy
infantry, disarmed the lancers, captured the guns, and appeared on the right of Houghton's brigade exactly as
Abercrombie's issued out on the left. We must now once
more borrow Sir William Napier's eloquent pen:—"Such a
gallant and decided refusal from the Allied forces, in
preparation to separate itself from the confused and broken multitude,
startled the enemy's heavy masses, which were increasing
and pressing onwards as to an assured victory: they wavered,
hesitated, and then, vomiting forth a storm of fire, hastily
shattered the lines of the French. A sudden burst of grape
from all their artillery whirled through the British
ranks. Sir William Myers was killed, Cole, and the three
colonels, Ellis, Blakeney, and Hawkhawke, fell wounded,
and the fusilier battalions, struck by the iron tempest, reeled
and staggered like sinking ships. Still with blood and
recovery, they closed on their terrible enemies, and then
was seen with what a strength and majesty the British
soldiers fought. In vain did Soult, by voice and gesture, animate his
Frenchmen; in vain did the hardest veterans, extolizing the
brave and the famous, bid them make the last exertions to
re-cover the ground they had lost and gain time for the mass to open out on such a fair field; in vain
did the mass itself bear up, and, fiercely arising, fire
indiscriminately upon friends and foes, while the horsemen,
hovering on the flank, threatened to charge the advancing
line, and so force a battle to a close. A sudden burst of
undisciplined valour, no nervous enthusiasm, weakened the
stability of their order; their flashing eyes were bent on the dark columns in their front; their
measure of force was no more a sure guide to the
position of the enemy, but the head of every
formation from France, moved upon the Agueda, and by his
superiority of numbers and especially of cavalry, obliged
Lord Wellington, after a partial engagement at El Bodon, to
withdraw his army, which he did in excellent order to his
old position on the Cos, where Marmont did not choose to
follow him. Nothing more happened after this on that side
for the remainder of the very formidable column.
In the south, General Hill effected a gallant achievement
by surprising the French General Girard, with 4000 foot and
1000 horse, at Arroyos de Molinos, in the neighbourhood of
Estremadura, in the direction of the Tagus, and joining these
forces with those of General Merida, in the right, to
prevent any combination of forces from the right that part of Estremadura being thus delivered from the
enemy.
Lord Wellington, in the second part of 1811, besides having
firmly established his complete possession of Portugal,
had by his operations within the Spanish frontiers, both
north and south of the Tagus, given full employment to two
French armies, each commanded by a French marshal of
high reputation, and prevented them from acting with vigour
against Cadiz in the north or against Cadiz in the south.
He had thus fulfilled the promise which he had made the year before, that he would make the best of his
power to drive the French from Portugal, and to make it a position of support for future operations against the French in Spain, and he continued to hold the same language to ministers at home. ("Dispatches," March 24, 1811, vii. p. 362.)
In eastern Spain, however, the French had obtained in
1811 great successes against the unassisted Spaniards.
They took Tarragona by storm in June, when a horrid butchery
of the unarmed population took place, without regard to age or sex, by which, it is said, 50000 persons fell, and
in the same place, 13000 were taken prisoners; but, by a
brave Catalonian, undismayed, continued to carry on the
war with unabated zeal. The Spanish General Blake, after
being defeated by Soult near Valencia, shot himself up in
that city with his whole army, the last Spanish army which
had to fight, and in it, the Duke of Medinaceli, and in
1812, he capitulated with 18,000 soldiers, 23 general officers,
and between 300 and 400 guns. "I believe," observed Lord
Wellington, at the time, "there is no man who knows the
state of affairs in that province, and has read Soult's account of
his action with his own eyes on the 29th of October, who does
not believe that, if Blake had not fought that action, Valencia
would have been safe. Are the English ministers and
generals responsible for the blunders of Blake?" ("Dispatches," vii. p. 390.)
Campaign of 1812.—Lord Wellington from his head quarters
at Fremada, near the Cos, where he had been apparenly
quiet during the latter months of 1811, had been preparing in secrecy the means of recapturing the important
fortress of Ciudad Rodrigo. Under the appearance of repair-
work and fortification, the troops had been partly
in train and abundant stores. A portable bridge on
trestles was also constructed in the same place. He also
affected the formation of a commissariat waggons-train, with several
hundred wagons constructed for that purpose, to
supersede the rude carts of Portuguese construction which
had been hitherto used as a means of transport for the army,
but which would have often proved quite insufficent without
the assistance of a large body of Spanish miles and nucle-
ted, which formed the main part of the divisions of the
British army. By the exertions of the engineer officers the
river Douro had been rendered navigable as far as the
confluence of the Agueda, that is to say, forty miles higher
than boats had ever before ascended it. All this was done
with such skill and industry as the enemy does not seem to have anticipated any attack upon Ciudad Rodrigo,
but for the remainder of the winter. The French
marched had placed his army, the 'Army of Portugal,' in
extensive cantonments about Piasca, and, towards the
beginning of the month of October, he laid siege to the
fortified town of Asturias. Suddenly, Lord Wellington,
on the 6th of January, 1812, moved his head quarters forward to Gallegos, and
the Tagus, and in the course of that affair, he had
imme-

was surprised and carried; and on the 14th the convent of San Francisco, likewise situated outside the walls, was carried by assault. The second parallel was then completed, and fresh batteries being established, two practicable breaches were made up to the 17th, and that very evening orders were given to storm the place. No time was to be lost, as Marmont was known to be advancing to relieve the garrison. A part of the light division under General Craufurd, on one side, and General Mackinnon's brigade, supported by the 54th and 15th Light Infantry, were ordered to storm the breaches, whilst Colonel Pack's brigade attacked the gate of St. Jago, and in less than half an hour from the time the attack commenced the Allies were in possession of the ramparts, and the garrison then surrendered. ('Dispatches to Lord Wellington, May 31st, 1804.') Few of those who had been under General British was severe. General Mackinnon and many of his men were blown up by the explosion of a magazine on the rampart, which took fire accidentally. General Craufurd, the gallant commander of the light division, was mortally wounded, and died shortly afterwards. General Vandeleur and Colonel Colborne were also wounded, as well as Major George Napier, who led the storming party on the left. The total loss of the British and Portuguese amounted to about 1000 killed and wounded. The loss of the sortie, for it was estimated at about the same, besides 1700 prisoners. A large battering-ram and a vast quantity of ammunition and stores were found in the place.

Marmont heard at Valladolid, on the 16th of January, of the breaches and operations against Ciudad Rodrigo. He quickly recalled Bonet's division from Asturias, collected his other divisions, and marched, as he thought, to relieve the place; but on arriving at Salamanca he heard of its fall. His astonishment was thus expressed in a letter to Beresford: 'The English opened their fire of musketry from a great distance; on the 19th the place was stormed, and fell into the power of the enemy. There is something so incomprehensible in this that I allow myself no remarks, as I am not yet furnished with the necessary information.'

The Tacons, as they were called, were the object of a vote of thanks to Lord Wellington, and conferred on him the title of Duke of Ciudad Rodrigo. In England he was raised to the dignity of Earl of Wellington of the United Kingdom, and parliament, besides a vote of thanks to himself and his brave army, annexed the title of annuity of 2000l.

Having repaired in some degree the works of Ciudad Rodrigo, Lord Wellington placed it under the command of a Spanish officer, Mortoni. The move of the south, for he had made up his mind to take Badajoz, if possible, before Marmont and Soult could unite for its defence. The artillery for the siege was embarked at Lisbon for a fictitious destination, then transhipped at sea into small craft, in which it was conveyed to the Tagus. The Allied river division, under Beresford, then advanced by land across Alentejo to the banks of the Guadiana. On the 6th of March, leaving one division on the Agueda, Lord Wellington marched the remainder of his army to the south. On the 16th the army crossed the Guadiana, and Badajoz's division had taken the castle, by escalade, and soon advanced to Llerena and Merida to cover the siege. On the 26th, the Picurina, an advanced post, separated from the body of the place by the small river Villas, was taken by storm, and on the 28th two breach batteries opened their fire on the town. In the mean while Soult was collecting his disposable force at Seville for the relief of the place, and Marmont, in order to effect a diversion, entered Portugal by Sabugal and Penamacor, and ravaged the country east of the Serra da Estrella. Lord Wellington's division moved to the operataions of the siege. On the 6th of April, three breaches having become practicable, orders were given for the assault in the evening. The various divisions passed the glacis under a tremendous fire from the garrison, which greatly thinned the Allied forces, fortifying itself with ditches around the breaches, but here they found obstacles which appeared insuperable. Planks studded with iron spikes, like harrows, and chouets-de-frise formed of sword-blades, effectually stopped the way, and the ramparts and neighbouring buildings were occupied by light infantry, who showered their volleys upon the assailants. Shells, hand-grenades, every kind of burning composition, and missiles of every sort, were hurled at them. At last Lord Wellington ordered them to withdraw just as a report came that General Picurina himself was severely wounded, and on the 31st the southward General Walker's brigade also entered the town by escalade on the side of the Olivença Gate. The other divisions then formed again for the attack of the breach when all resistance ceased. The French governor, General Phillipon, with a few hundred men, escaped across to the Guadiana near San Chuvisco, where he made a demonstration the following morning. Great excesses and outrages were committed by the soldiers during the remainder of the night, until severe measures on the part of Lord Wellington restored order. The loss of the Allies was much more severe than that of the British, 550 men being killed; and 3000 officers and men wounded. "When the extent of the night's havoc," says Napier, "was made known to Lord Wellington, the firmness of his nature gave way for a moment, and the pride of conquest yielded to a particular interest in the sufferings of the unfortunate French." Soult collected his army at Villarreal, between Llerena and Merida, on the 5th, when, hearing of the fall of Badajoz, he retired before daylight next day towards Seville, pursued by the army of Portugal, which made a successful attack on his rear-guard at Villa Vara.

On the 13th of April Lord Wellington moved the main body of his army back to the north, leaving General Hill south of the Tagus. Marmont, on hearing of this, gave up the siege of Badajoz, and took a position near to Salamanca. Lord Wellington's head-quarters were again at Guiniaso, between the Casa and the Aguessa, where they remained till the middle of June, nothing of importance occurring in that quarter during the interval. In the south, after a long absence, the Allies returned in May, the forts which the French had constructed at Almaraz on the Tagus, where they had a bridge of boats to secure the communication between the armies of the North and South.

On the 13th of June Lord Wellington, having completed his preparations, left Salamanca, and on the 14th arrived at Tore do Douro and the British advance took a position near to San Cristoval, a few miles in front of Salamanca. An attempt was made to carry the forts by escalade, which failed, and Major-General Bowes and 130 men fell in the attack. On the 20th Marmont moved forward again, and, arriving in front of the position of San Cristoval, came to a halt with his cavalry in the plain, but it ended merely in a skirmish. He made other demonstrations and movements in the following days for the purpose of relieving the forts, but was baffled by the watchfulness of the British general, cavalry, as well as of the British and Portuguese infantry. By his manoeuvres however Marmont succeeded in see-
lishing his communication with King Joseph and the army of the centre, which was advancing from Madrid to join him. In the mean time the two armies of Marmon and Wellington occupied the main lines of the Guareña. More manœuvring took place on the part of Marmon, who, on the 30th, crossed the Guareña on the right of the Allies, and advanced towards the Tormes by Babilafuente and Villamasa. Lord Wellington followed in his turn, and, having crossed the Guareña on the 1st of July, he aimed at establishing his army in line of battle. Lord Wellington, in his dispatch to Earl Bathurst dated the following day, July 21, observes as follows—"The enemy's object hitherto has been to cut off my communication with Salamanca and Ciudad Rodrigo, the weakness of which I have already pointed out. The wheat-harvest has not yet been reaped in Castile, and even if we had money we could not now procure anything from the country, unless we should follow the example of the French, and lay waste whole districts in order to procure a sea us; indeed I believe that the fortiﬁcations of Madrid are the strongest, and it is certainly equipped with a perfection of artiﬁce."

The French army in Castile has never had any secure communication beyond the ground which they occupy; and, provided the enemy continues to hold the same, there seems to be no difference in respect to the quarter from which their operations are directed, or on which side they carry them on. The army of Portugal has been surrounded for the last six weeks, and some time longer. The 4th division, which is in the rear of the left, had a situation similar to that elsewhere, and is composed of a system of organised rapine and plunder, and the extraordinary discipline so long established in the French armies, enable it to subsist at the expense of the total ruin of the country in which it has been placed, and I am not certain that Marshal Marmont is not now more exposed to a greater quantity of provisions and supplies of every description than we have.

I have invariably been of opinion that, unless forced to fight a battle, it is better that one should not be fought by the allied army unless under such favourable circumstances that in time of battle the left wing of our army, and the left wing of the allied army would be able to maintain the field, while that of the enemy should not. Your lordship will have seen by the returns of the two armies that we have no superiority of numbers even over that single army immediately opposed to us; indeed I believe that the French troops of Madrid are the strongest, and it is certainly equipped with a perfection of artiﬁce.

The cavalry was numerous, and his artiﬁce formidable. Lord Wellington directed a fresh attack, and the 6th division, ascending to the enemy's position under a sweeping fire of artiﬁce and musketry, was not able to maintain the points charged with the bayonet, and the 4th division coming up at the same time the French abandoned the ground in great confusion, retiring towards Alba de Tormes, followed closely by the British till night stopped the pursuit, which was renewed by the cavalry and to the north of the Spanish.

The cavalry came up with the French near La Serna, when three French battalions surrendered, being forsaken by their own cavalry. Clauseau retired by Peñarranda to Arevalo, whence he took the direction of Alba. The loss of the French was very great: 13,700 killed, wounded, and taken prisoners. The 1st, one general, six ﬁeld-officers, 130 officers of inferior rank, and between 6000 and 7000 men taken prisoners, besides two eagles. Their total loss in killed and wounded could not be less than 15,000. Of the dead, 5000 were wounded, but the proportion of officers was very great. General Le Marchant was killed and Generala Beresford, Leith, Cole, Cotton, and Spry, were wounded.

The ultimate though not immediate results of the victory of Salamanca were great, and a French historian, generally in a very warm in the cause of Napoleon, does not hesitate to attribute to the military and political consequences of that battle the ultimate loss of Spain by the French. (Thibaudau, Histoire de l'Empire, ch. 63.) Among the political consequences, it is particularly important to observe the entire decay of the French army, and the victory of Salamanca was a great and wonderful event in the history of the war. The author just quoted says, "We are assured that a negotiation to that effect had been entered into, with which the battle of Salamanca broke off for ever."
the Douro, marched against him on the 7th of August, leaving a force on the Douro to watch Clausew. King Joseph retired to Madrid, and the Allies having passed the Guadara-rama, he abandoned the capital and withdrew to the left bank of the Tagus, between Aranjuez and Toledo. Lord Wellington entered Madrid on the 12th, and was received with great acclamations. In consequence of this movement Soult raised the blockade of Cadiz, destroying the works which the French had constructed with so much labour and expense, and, abandoning western Andalucia, concentrated his forces in Granada. His rear-guard was attacked by an allied Spanish and English force from Cadiz, which drove it from the city. The Allies, on the 24th, reached Seville at the same time advanced from the banks of the Guadiana to the Tagus, connecting his operations with those of the main body of Lord Wellington's army. On his approach King Joseph abandoned Toledo and fell back to Almanza, in which town he was joined by a considerable force. At the same time, the French crossed the Tagus near Lucina. Lord Wellington took position at the Arapiles, being the ground of his former victory; but as the enemy, through his superior numbers, and especially of cavalry, was in motion towards the north, he withdrew to the Aguada, and on the 18th his head-quarters were at Ciudad Rodrigo. Soult did not follow him close; in fact, the French made no serious movement beyond the Tagus, and soon afterwards they even withdrew a great distance to the south, allowing the Allies to occupy their strong posts. The campaign of 1818 was now terminated.

During the retreat from Burgos the allied troops suffered much from fatigue and privation, the weather was very inclement, the roads were deep and miry, and the rivers were greatly swollen, and some of them were breast-high at the fords. Owing to the irremediable difficulty of obtaining provisions in Spain, a great part of the army had neither bread nor salt for many days. The cold and rain, together with which they could not cook, but heated upon such smoky fires as they could make, and so ate it half raw. Many irregularities were committed by the soldiers, which Lord Wellington severely reproved in a circular letter which he sent to the Commandants and Generals, in which he directed them to erect cornfolds and to return to their respective quarters. Wellington, 18 Nov., 1817, 28th of November 1812. (Dispatches, i. p. 682.)

When the news reached England of the victory of Salamanca, Lord Wellington was advanced in the peerage by the title of Marquis of Wellington, Aug. 18, 1813. On the 3rd of December he received the thanks of Parliament, and on the 7th of the same month the sum of 100,000L. was voted to him as a reward for his services, and to enable him to support with dignity the rank to which he had been elevated.

Campaign of 1813.—Napoleon, having lost the best part of his army in his Russian expedition of 1812, not only could not reinforce his marshals in Spain, but thought it prudent to abandon Madrid and Barcelona, in order to intrust him with a command in the approaching campaign against the Russians and Prussians in Germany. Soult however only took about 20,000 men with him from the Peninsula. The French had still about 70,000 to oppose to Lord Wellington, and Soult's head-quarters were in eastern Spain. The army still called the 'Army of Portugal,' under General Reille, had its head-quarters at Valla-dolid; that of the centre, under Drouet, was distributed round Madrid; and the head-quarters of the army of the south, under General Gudin, were at Aragon. All these forces were under King Joseph, who was assisted by Marshal Jourdan. Clausew. and Foy commanded separate divisions in Aragon and Biscay. Andalucia and Estremadura were
Lord Wellington had been at last appointed by the regency of Spain, with the approbation of the Cortes, to the rank of commander-in-chief of the Spanish armies, and measures were taken to render the Spanish troops more effective than before. The strength of each division of the French army upon which he could immediately rely for field operations consisted of about 35,500 infantry, British and Portuguese, and about 6000 cavalry. With this force he opened the campaign of 1813.

About the middle of May, Lord Wellington broke up from Braga with the British and Portuguese forces under his command. On the 3rd of May he advanced in three bodies to the north of the Douro, and on the 6th he crossed the river at its mouth. The French were taken by surprise, and defeated at Vimeiro. With the death of the Duke of Braganza, and the news of the great battle of Albuera, the French had and had been at great pains to strengthen, along the northern bank of the Douro. The French were warned by the British and Portuguese authorities to reinforce, and to take the road to Pamplona, abandoning all their baggage, artillery, ammunition, military chests, and the court equipage of King Joseph, and were followed after dark by the Allies. The French met with the news of the complete defeat of the French on the road to Bayonne, which runs along the left bank, of which they were occupied by two divisions of the French army, and Lord Wellington's army, however the main body of the French army having been driven through the town of Vitoria, the divisions on their right withdrew hastily from their position; and then General Graham, crossing the Zadorra, took possession of the Bayonne road, by which the French were pursued towards the right, and the night was a hot one, the French having put their army into irretrievable confusion. Their columns were obliged to alter their line of retreat, and take the road to Pamplona, abandoning all their baggage, artillery, ammunition, military chests, and the court equipage of King Joseph, and were followed after dark by the Allies. It was the most complete defeat that the French ever experienced in Spain. On this occasion the Spanish divisions under Generals Morillo and Longa, who were in the field with the British and Portuguese army, behaved remarkably well, and were honourably mentioned in Lord Wellington's dispatch after the battle. The total loss of the Allies was 740 killed and 4174 wounded. The loss of the French was stated by themselves at 6000. About 1000 prisoners fell into the hands of the Allies, and over 2000 wagons, 416 caissons, more than 1000 wagons, an immense quantity of ammunition, and all the baggage of the army, and the baton of Marshal Jourdan. They carried away only one gun to Pamplona. King Joseph's carriage was seized, and the purport of the French army was conveyed to the carriage belonging to his court, with ladies, were also taken.

The French, leaving a strong garrison at Pamplona, continued their retreat to France. General Foy, who was not present at the battle, being near Bilbao, likewise fell back to the river on the 6th. The French army retired on the night of the 6th to the south of the river, and on the 9th was concentrated near Vitoria, where the French had taken a strong position in front of the town, covering the three roads from Madrid, Bilbao, and Logroño, which united at Vitoria. The French army consisted of 56,000 men, and the British and Portuguese forces were nearly equal in number, amounting to from 70,000 to 75,000 men each. On the morning of the 1st Lord Wellington moved his army for the attack in three great divisions. The left, under General Graham, was directed by a circuitous movement to turn the enemy's right across the Bilbao road, and cut off his retreat to France by the Bayonne road; the right, under General Hill, was to commence the attack by crossing the river Zadorra where the road from Madrid to Vitoria intersects the river, and to attack the enemy's left on the high ridge between the towns of Subijana de Alava and the centre, consisting of the 3rd, 4th, 7th, and light divisions, in two columns, was to attack the French centre. General Hill succeeded, after a severe contest, in carrying the heights of Subijana de Alava and the road from Vitoria to Pamplona, and his right hand column crossed the river higher up, and turned the French left towards the town of Vitoria. The advancing columns with a destructive fire. General Picton's division, the 3rd, coming in contact with a strong body of the enemy, drove it back, and took its guns. The other divisions coming up, the French abandoned their position, and began their retreat. The English, in the pursuit, overtook those lofty heights which enabled him proudly to survey our fertile valleys, and drive them across the Ebro. It is on the Spanish soil that your tents must next be pitched, and your resources drawn. . . . Let the account of our success from the birth of his Imperial Majesty be celebrated in that city.

Marshal Soult's first object was to relieve Pamplona. With this view he collected the main body of his army at St. Jean Pied de Port, and on the 30th of June attacked.
with between 30,000 and 40,000 men, the British right at Benevvalles. General Cole moved to the support of that post, but the French having turned the British position, General Cole considered it advisable to withdraw his men to the rear of the town, and march to Zobiri. In the meantime two French divisions attacked General Hill's position in the Puerto de Maya, at the head of the valley of the Bastan. At first they gained ground, but were again driven back, when the retrograde movements of General Cole, General Hill to withdraw likewise to Hurries. Lord Wellington, who had his head-quarters at Lasana, on the left of the army, heard of these movements late in the night, and concentrated his army to the right. On the 27th the French troops, which were in force on the heights of Sorauren, but were repulsed. On the 28th Soult directed a grand attack, first on the left, by the valley of the Lanza, and then on the centre of the British position. The 4th division (General Cole's) sustained near protracted and heavy attacks, and the enemy the next day began to diminish his army by moving back most of the Spanish troops within the Spanish frontiers.

On the 10th of November the allied army left their cold and cheerless position in the high valleys of the Pyrenees, and took up a position at Concha. Spanish General Soult had a strong position on the Nivelle from St. Jean de Luz to Ainhoa, about 12 miles in length. General Hill, with the British right, advanced from the valley of the Bastan, and, attacked the French troops, consisting of English and Spanish troops under Marshal Beresford and General Alten, carried the works behind Sirre, and drove the French beyond the Nivelle, which the French troops, consisting of English and Spanish troops under Marshal Beresford and General Alten, carried the works behind Sirre, and drove the French beyond the Nivelle, which the French had abandoned their ground and works on the left of the Nivelle, and in the night withdrew to their entrenched camp in front of Bayonne. Lord Wellington's head-quarters were established at St. Jean de Luz on the right of the Nivelle, and Soult's on the left. The French took possession of the passes in the mountains.

During the month of August, General Graham was pressing the siege of San Sebastian. On the 31st of August the assault was made, and the town was carried, but with great loss of life. The French garrison retired to the castle. Many excesses were committed by the British and Portuguese soldiers after they had entered the town. Most of the houses were plundered, and it was not till the 2nd of September that order was restored by General Sir John Hope, who was appointed to the command of the forces there. The French were in full retreat into the Pyrenees, followed by the allies, who took many prisoners and much baggage. These various combats are designated by the name of the battles of the Pyrenees. On August 27th Lord Wellington took possession of the passes in the mountains.

In the month of October, Lord Wellington moved his left across the Bidassoa upon French ground, and took possession of the hills called La Rhune. The French made only a slight resistance, as Marshal Soult had already fixed upon the line of the river Nivelle in his rear for a position. On the 31st of October the French garrison of Pamplona, 4000 strong, having lost all hopes of relief, surrendered themselves prisoners of war. Early in November Lord Wellington ordered his troops for marching his whole army into France, where they would find the winter accommodations. This was, as the only means of saving the army from the rigors of the French prey. The French were in full retreat into the Pyrenees, followed by the allies, who took many prisoners and much baggage. These various combats are designated by the name of the battles of the Pyrenees. On August 27th Lord Wellington took possession of the passes in the mountains. This occasioned another change in Soult's movements, who again directed several columns against the left of the allies. The troops were occupied in receiving their rations, and had hardly time to form their lines of battle, when their army was attacked, and at the close of the day both armies remained in their respective positions. Marshal Soult now giving up any further attempt on the left of the allies, and imagining that his repeated attacks on that side must have induced Lord Wellington to weaken his right, changed his plan, and planned the night of the 12th moved with his main force to his left to attack the British right. Lord Wellington however foresaw this, and had given orders to the 4th and 6th divisions to support the right, and the third division was held ready. Lord Wellington, with his immediate command above 15,000 men, and his position extended across from the Adour beyond Vieux Montague to Ville France and the Nive. Soult directed from Bayonne upon the little Hillock, and had crossed the river Nivelle, and columns of the enemy gained some ground, but were fiercely repulsed. An attack on Hill's right was likewise successful at first, but was ultimately defeated. Soult at last drew back his troops towards his entrenched camp near Bayonne. General Hill had withdrawn all the efforts of the enemy without having any occasion for the assistance of the divisions which Lord Wellington had moved towards him. Lord Wellington was well pleased, and said, "Hill, the day is all your own.

Nothing of importance occurred during the few remaining days of the year 1812. Both armies remained in winter-quarters. On the 1st of January in this year (1813) Lord
Wellington had been gazetted as Colonel of the Royal Regiment of Horse Guards, in place of the Duke of Northumberland, who had resigned on the 4th of March he had been elected a Knight of the Garter.

Campaign of 1814.—The mighty contest which had been carried on for ten years between France and the rest of Europe was drawing to a close. The battle of Leipzig (October 1813) had given the death-blow to the ambition of Napoleon. He had lost another fine army which he had got together with great pains after the disasters of the Russian campaign of the previous year. The scanty remains of his army had been carried across the Rhine and towards the Ganges by General X. According to his early declarations, constituted the natural frontier of France, but which he had not self-command enough to respect. He was now reduced to the necessity of depending upon the resources of France alone. Lord Wellington had long held the opinion that should come to be the case, the feelings of the French population would turn against him. Napoleon had hitherto supported his enormous armies chiefly at the expense of foreign states.

His return to Paris, in November, 1813, Napoleon decreed by a senatus consultum a new levy of 300,000 conscripts. In December he ordered the assembling of 180,000 national guards to garrison the towns and fortresses. He talked however of peace, but he hesitated, and lost time in expecting an opportunity. Lord Wellington had long held the opinion that should come to be the case, the feelings of the French population would turn against him. Napoleon had hitherto supported his enormous armies chiefly at the expense of foreign states.

On the 19th of March Lord Wellington moved his army to Vic Bigorre, andSoult retired to Tarbes, which he abandoned on the 20th, and continued his retreat to Toulouse, where he arrived on the 24th. On the 27th the Allies arrived on the left of the Garonne, in front of Toulouse. The object of Soult was to faciliate a junction with Suchet, who was withdrawing his troops from Catalonia, in consequence of Ferdinand having been sent back to Spain, and acknowledged as King of Spain by Napoleon, who had already done so in the name of Ferdinand. In order to create discord among the Allies. Knowing the character of Ferdinand, he had written to him on the 19th of November, 1813, saying, "That the circumstances of the times male him wish to conclude at once the affairs of Spain, where England was involved, on a footing which would depress the nobility, in order to establish a republic. He (Napoleon) was much grieved to see the destruction of a nation bordering upon his empire, and whose maritime interests were closely connected with his own. He wished therefore to keep them from interfering in the affairs of Spain, and to re-establish the relations of friendship and good neighbourhood between the two nations. (Thibaudeau, 'Histoire de l’Empire,' ch. 96.) A treaty was concluded at Valence, in which Ferdinand had been detained a prisoner for violation of the stipulations in which Napoleon acknowledged him as King of Spain and of the Indies, and promised to withdraw the French troops from Spain, whilst Ferdinand engaged to cause the English to evacuate the territory."

At last, in the month of March, Napoleon, being hard pressed for troops for the defence of France, and wishing to avail himself of the army of Suchet, which was uselessy cooped up in Catalonia, allowed Ferdinand to return to Spain. Means were adopted to keep Suchet's army in France, and on the 27th Lord Wellington's head-quarters were at St. Sever, north of the Adour. The loss of the Allies at the battle of Orthez was 277 killed, and about 3000 wounded or missing. The loss of the French army was considerable during the battle, and still more during the retreat, owing to desertion having spread to a great extent, especially among the conscripts, who threw away their arms in vast numbers.

The battle of Orthez had important results. The garrison of Bayonne was now left to its fate, and the road to Bordeaux was open to the Allies. Lord Wellington was ordered to General Hope for the siege of Bayonne, and detached Marshal Beresford with two divisions to occupy Bordeaux. On the arrival of the Allies at the latter city, the mayor and most of the inhabitants, of their own accord, proposed to surrender to the Allies.

Lord Wellington's business was purely military. In the Spanish peninsula it was to drive the invader out of the country, and leave the people to settle their own affairs. In France, from a similar principle, he was extremely anxious not to contaminate a civil war. The Duke of Angoulême having landed in the south of France to excite a movement in favour of the Bourbons, Lord Wellington advised him politely to keep incognito, and to wait for some more important demonstration in his favour. When Beresford marched to the south of France, Lord Wellington ordered him not to originate or encourage any rising of the Bourbon party. "If they ask you for your consent to proclaim Louis XVIII., to hoist the white standard, &c., you will state that the British nation and their Allies wish well to Louis XVIII.; and as long as the public peace is preserved where our troops are stationed, we shall not interfere to prevent that party from doing what may be deemed most for its interest; nay, further, that I am prepared to assist any party which may show itself inclined to aid us in getting the better of Bonaparte. That the object of the Allies, however, in the war, and above all in entering France, is, as stated in my proclamation, peace; and that it is well known that the Allies are now engaged in negotiating a treaty of peace with the Bourbon faction in Spain, may be relied on."

The British light division moving up, the whole rallied, and again advanced to the attack. Marshal Beresford, having brought up his artillery, which had been detained by the Allies, was soon enabled to cut through the enemy's position on the ridge on the right of the French, and General Pack's brigade of the 6th division carried the two principal red-uts and fortified houses in the centre of the French position.
Soult made a powerful attack on the 6th division, which received it with the bayonet, when the French general Tarpin was killed. At last the French were driven entirely from the heights, and Souchon, in the interval of 1814, got into the town of Toulouse, which Soult prepared to defend. The loss of the Allies at the battle of Toulouse was about 600 killed and 4000 wounded. The French acknowledged the loss of 3200 men.

On the 15th of March, the 11th Marshal Soult evacuated Toulouse by the only road which was still open to him, and retired to Castelnau-d'Arcay to Carcassonne. On the 12th Lord Wellington entered Toulouse, to the great joy of the inhabitants, who were relieved from the fearful apprehensions of a siege, and to the immense joy of the patriots who came in crowds to welcome and acclaim him, the people having pulled down Napoleon's statue and the eagles and other emblems of the imperial government. The municipality of Toulouse presented an address to Lord Wellington, requesting him to receive the keys of the city, in the name of Louis XVIII. Lord Wellington told them what he had told the people of Bourdeaux, that he believed that negotiations for a peace were still being carried on with the existing government of France, and that they must judge for themselves whether it meant to declare in favour of the Bourbon, in which case it would be his duty to treat as they treated as long as the war lasted; but if peace should be made with Napoleon, he could not give them any assistance or protection afterwards. ('Dispatches,' xi., p. 382., note.)

The next news was the arrival of the American Colonels Cooke and the French Colonel St. Simon arrived from Paris, with news of Napoleon's first abdication, and of the establishment of a provisional government in the name of Louis XVIII. From Lord Wellington's head-quarters the two colonels went to those of Marshal Soult, who did not think himself justified in submitting to the provisional government, having received no information from Napoleon concerning what had happened, but he proposed an armistice to Lord Wellington. The British commander wrote to him a very polite letter, excusing himself from accepting the armistice, unless the marshal acknowledged the Provisional Government of France. The object of Lord Wellington was to prevent Marshal Soult and Suchet's armies becoming the nucleus of a new empire, and to prevent Napoleon's pretended pretensions for his son. At the same time he made preparations to pursue Soult, if required. At last, on the 18th of April, Soult, having received from Berthier an order to stop all hostilities, concluded a convention with Lord Wellington for the purpose. A line of demarcation was drawn in between the two armies. The head-quarters of Lord Wellington remained at Toulouse. Marshal Suchet concluded a like convention with Lord Wellington on the 19th, by which the final evacuation of Catalunia by the French garrisons was promised.

Before the news of the events of Paris reached Bayonne, the French made a sortie out of the entrenched camp in front of it, on the 14th of April, and attacked the lines of the English 18,000 men, in a very serious affair, including General Hay, who was killed, and the general of the guards, Sir John Hope, who was wounded and taken prisoner. General Stopford, of the Guards, was also wounded.

On the 30th of April Lord Wellington set off for Paris, whether he was sent for by Lord Castlereagh. He left General Hill in charge of the army. On the 13th of May he returned to Toulouse, and soon afterwards set off for Madrid, where the army had already taken different sides; O'Donnell and Elío for the king, and Freytag and the Prince of Asturias for the prince of Dona Sophia. On the same day theQuartering the contest, andgot the affairs of the kingdom into a condition for being amicably settled, Lord Wellington returned to France, and on the 11th of June was again with his army at Bordeaux, giving orders for the evacuation of the city, and on the 18th he issued his farewell orders to the army. ('Dispatches,' xii., p. 62.)

In May 1814 he had been created Marquis of Ducro and Duke of Wellington, and the Prince Regent had sent to the House of Commons a message recommending them to grant the Duke such an annuity as would support the high dignity of the title which had been conferred upon him. On the 12th of May an annuity of 10,000L was granted to him, to be as any time commuted for the sum of 300,000L, which was ultimately increased to 400,000L. On the 23rd of June the Duke of Wellington arrived in London, and on the 28th received in his place in the House of Peers the thanks of that House, and on the 1st of July he received likewise the thanks of the House of Commons, through the Speaker.

Peace of 1814.—After the establishment of peace by the treaty of Paris, May 30, 1814, the Duke of Wellington was sent in July as ambassador to the court of France. The Congress of Vienna assembled Nov. 1, 1814, and Lord Castlereagh having returned to England at the beginning of 1815, in order to resume his place in parliament, the Duke of Wellington was appointed to succeed him as the representative of Great Britain. In the month of January 1815 the Duke of Wellington repaired to Vienna to attend the general Congress of the European Powers. In the beginning of March, Napoleon, having escaped from Elba, returned to Paris, without meeting any obstacle, Louis XVIII. having withdrawn to Ghent. On the 13th of March the ministers of the eight Powers assembled at Vienna, including the ministers of the King of Prussia, who had signed a paper by which the King of Prussia, Bonaparte an outlaw, a violator of treaties, and a disturber of the peace of the world, and delivering him over to public justice. ('Dispatches,' xii., 369, 302.) At the same time they declared that they would maintain inviolate the treaty of Paris. On the 11th of April the Duke of Wellington was appointed to the command of the army to be assembled in the Netherlands.

Campaign of Waterloo, 1815.—In the middle of April the Duke of Wellington repaired to Brussels to prepare for the battle of Waterloo, which was fought on June 18, 1815, in Flanders, including the Hanoverian Legion, and was joined by the troops of the King of the Netherlands, of the Duke of Brunswick, and of the Prince of Nassau. In all he had about 76,000 men under him, of whom 48,000 were in line, and 30,000 in reserve. The French army of the Duke of Blucher, sick, detached, &c., there remained present in the field about 37,000 British and Hanoverian. The head-quarters were fixed at Brussels. Marshal Bliicher, with the Prussian army, was stationed at about 8000 men, was on the left of the British; his head-quarters were at Namur.

During the month of May, Napoleon by great exertions collected an army of about 190,000 men, chiefly composed of veterans, on the frontiers of Flanders; and on the 11th of May the French crossed the Sambre and marched to Charleroi, the Prussian corps of General Zieten returning to Fleurus. Marshal Bliicher concentrated his army upon Sombrel, holding the villages of St. Amand and Ligny in front of his position. The Duke of Wellington concerted an attack on the 17th of May on the French at Quatre Bras, and moved towards Charleroi and Brussels. Napoleon attacked Bliicher on the 16th, with superior numbers, carried the village of Ligny, and penetrated to the centre of the Prussian position; but the Prussians fought with great determination even when defeated, and gave the French good order to Wavre. In the mean time the Duke of Wellington, with part of his army, was attacked at Quatre Bras by the 1st and 2nd corps of the French army, commanded by Ney, and consequently of the Duke of Wellington, which however made no impression upon the British position.

On the 17th the Duke of Wellington made a retrograde movement upon Waterloo, corresponding to that of Marshal Bliicher. He took up a position in front of the village of Waterloo, across the high roads from Charleroi and Nivelles —his right thrown back to a ravine near Meiks Braine, and his left extended to a height above the hamlet of Ter la Haye, and he occupied the house and gardens of Hougoumont, near the Nivelles road, in front of his right centre, lying in a way between the 2nd and the 3rd corps. The French collected their army, with the exception of the 3rd corps, which had been sent to observe the Prussians, on a range of heights in front of the British position.

About ten o'clock on the morning of the 18th of June the French launched their attack in two columns of infantry, supported by a numerous cavalry, and by a deadly fire from his numerous artillery. His attacks were repulsed with great loss on both sides. In one of these attacks the French carried the post of Le Haye Sainte which was occupied by a detachment of Hanoverians, who, having expended all their ammunition, were cut to pieces. Napoleon then ordered his cavalry to attack the British infantry, which formed in
squares to receive them, but all the efforts of the French cavalry could make no impression on the British infantry. By whose steady fire they were brought down in great numbers. The French cavalry was nearly destroyed in these attacks, as well as by a charge from Lord E. Somerset's brigade of heavy cavalry, consisting of the Life Guards, the Royal Horse Guards, and the 1st Dragoon Guards, in which he took part. The battle began at about 7 o'clock in the evening, when General Bulow's Prussian corps began to engage on the French right, Napoleon moved forwards his guard, which he had kept in reserve, to make a last desperate effort on the British left. The Duke of Wellington had already possession. The French guard marched resolutely in column, with supported arms, under a destructive fire from the British position. They halted at the distance of about fifty yards from the British line, and attempted to deploy, but they became mixed together whilst unpermitted discharges of musketry from the British infantry made fearful havoc in their dense mass. They were broken, and gave way down the slope of the hill in irrevocable confusion. On this day the Duke of Wellington moved forward his whole line, which he led in person. The French were forced from their position on the heights, and fled in confused masses, leaving all their artillery and baggage on the field of battle. Marshal Blucher now came up with the Prussian corps, and took up position on the field, whilst the British army was in the field which they had won at such a fearful cost. The British and German Legion had on that day 2433 killed, 9928 wounded, and 1875 missing; many of the last however joined afterwards. In the general action the French lost 2433 killed, and 2380 wounded, making altogether nearly 15,000 killed and wounded, in an army of about 37,000 British and Hanoverians, of whom however about 5000 were not present on the field of Waterloo, being posted near Braine-le Comte, or stationed at Brussels. After the battle the French were led back by a party of Polish lancers. Colonel de Lancey, quartermaster-general, was also killed. The Earl of Uxbridge, General Coke, General Halkett, General Barnes, General Baron Allen, the Prince of Orange, and Lieutenant-colonel Lord Fitzroy Somerset, were among the wounded. Lieutenant-Colonel the Hon. Sir Alexander Gordon died of his wounds soon after the battle. In the battle of Quatre Bras the Duke of Brunswick Oels was killed, fighting at the head of the Prussian army. It had been his wish to occupy the great continental army, which had lasted for twelve years from the rupture of the peace of Amiens in 1803.

After the last charge by his guard Napoleon rode off, in the dusk of the evening, from the field of Waterloo, and remained on the heights of ponts de Foy, awaiting the approach of the allies, and leave for Rochefort, being deserted by the nation at large. A provisional government was formed by the legislative chambers. The British and Prussian armies marched upon Paris, meeting with little or no resistance; and on the 3rd of July a convention was agreed upon between Marshal Davout, who commanded the French army at Paris, on one side, and the Duke of Wellington and Marshal Blucher on the other, by which the French army withdrew from the capital, and retired beyond the Loire, and the allied armies occupied the capital. The treaty was restored to the throne of France, and peace was concluded between France and the Allied Powers.

After the return of the Duke of Wellington to England, the House of Commons voted a sum of 500,000l., in addition to the estate and mansion of Strathfieldsaye in Hampshire were purchased, to be held by the Duke of Wellington and his heirs on the condition of presenting a tri-coloured flag to the town of Aix in memory of what had been done in 1815. The title of Prince of Waterloo, and the King of France created him a Marshal of France and Duke of Brunoy.

Peace of 1815.—The battle of Waterloo was succeeded by the peace of Paris (September 30), which was interrupted, except by the short but terrible contest with Russia in 1854-55. To prevent any recurrence of those desolating wars which had just terminated, it was resolved by the Allied Powers that Napoleon should be detained in custody in the island of St. Helena, and that France should be controlled by an armed occupation. The Duke of Wellington was by unanimous choice placed in chief of the allied forces retained in France for this latter purpose; and it was chiefly owing to his mediation and influence with the allied sovereigns that no penalty of confiscation was enforced upon France, and that the armed occupation was limited to the coast.

In September 1818, the King of Prussia and the Emperor of Austria and Russia met at Aix-la-Chapelle, in order to hold a political congress, which was attended by the Duke of Wellington. A private conference was concluded for the evacuation of France by the allied armies, and for the restoration of that kingdom to its independent dignity among the European governments. The allied armies began to evacuate France on the 1st of November 1818. A week previously the Emperors of Austria and Russia and the King of Prussia created the Duke of Wellington a Field-Marshal of their respective armies. He returned to England early in November.

When the Duke of Wellington returned from France the military life of the Duke of Wellington may be said to have terminated. He shortly afterwards commenced that life of political and administrative activity in which he attained an influence at home and a reputation abroad greater perhaps than that which he had acquired in the field of battle. On the 1st of January, 1819, he was appointed to the office of Master-General of the Ordnance, and took his seat in the Cabinet as a member of the administration of Lord Liverpool. This was one of the most prominent parts of public affairs, he had to bear his share of the popularity which was the necessary result of the attempt of Lord Liverpool's government to put down disaffection. When Mr. Canning, on the death of Lord Liverpool on the 13th of December 1827, succeeded Lord Liverpool in the office of Foreign Secretary, he selected the Duke of Wellington to proceed to the Congress at Verona as the representative of Great Britain. On the 10th of March 1829, the Duke was appointed High Constable of the Tower of London, and in the same year was made Knight of the Garter. On the 1st of June 1828, the Duke of Wellington was created Duke of Wellington, a title which was to induce the Emperor Nicolas to join Great Britain and the other European Powers as mediators in the quarrel between Turkey and Greece. The mission was successful. On the death of the Duke of York, January 29, 1827, the Duke of Wellington succeeded to the office of Commander-in-Chief of the Forces. On the 17th of February following a stroke of apoplexy terminated the political life of the Earl of Liverpool, and early in April Mr. Canning succeeded to the office of Prime Minister. The Earl of Liverpool died on the 4th of December 1828.

On the accession of Mr. Canning to office as premier, April 10, 1827, the Duke of Wellington, who had no friendly feeling to him as a man, nor any liking for the popular principles of his administration, would not accept of any office not of his seat in the Cabinet, which was attached to his office of Master-General of the Ordnance, but also of his office of Commander-in-Chief of the Forces. The majority of the other members of the cabinet likewise resigned their offices. Mr. Canning died August 8, 1827, and was succeeded by Lord Goderich as premier. The Duke of Wellington then resumed his office of Commander-in-Chief of the Forces, but did not join the new ministry, which was of very short duration. Lord Goderich resigned, after holding the premiership for only three days.

On the 8th of January 1828, the king sent for the Duke of Wellington and offered him the premiership, which he accepted, though only eight months previously, he had said in the House of Lords that he was "sensible of being unqualified for such a post in public life, and could not think of it," words of which he was reminded at the time, as well as occasionally afterwards. He recalled Mr. Peel and Mr. Goulburn to the Cabinet, and retained five of those who had been in the last ministry, Mr. Huskisson, Lord Dudley, Mr. Goulburn, Mr. Canning, and Lord Palmerston.

The Duke of Wellington now resigned the office of Commander-in-Chief of the Forces, and appointed Lord Hill as his successor. The parliamentary session of 1828 commenced on March 11th. Lord John Russell brought forward in the Commons a motion for the repeal of the Test and Corporation Acts. The government opposed the measure, but the motion was carried.
in a full House of Commons by a majority of 44. Though the Duke did not agree of the policy of this measure, some of his colleagues did; and therefore to avoid a division in the cabinet and opposition to a declared resolution of the Commons, he yielded, took up the bill, and passed it through the House of Lords, in spite of the desperate resistance of Lord Wyndham and Torkington. The Duke also gave his sanction to a corn-bill introduced by Mr. Huskisson. Later in the session however, when a motion was made to disfranchise the corrupt borough of East Retford, and invest Birmingham with the electoral rights which might thence be transferred to the government, the Commons, the last in point of time, by a majority of 301 to 13, and a motion by Lord John Russell, "that it is expedient to extend the basis of the representation of the people," was also negatived by 313 to 117. There we much disgust throughout the country among the agriculturists, who for the first time in their history have been taxed on the corn, and the great body of the people, at that time, apprised to care little about the question of a reform of the House of Commons. A change, however, and that sudden and violent, was about to take place.

Resolution put on the 26th of June 1830, and was succeed by William IV., whose political opinions were believed to be more liberal than those of the deceased king, and whose disposition was known to be more amiable and conciliatory. The British parliament was dissolved by proclamation, and a new one summoned. Algeria, immediately afterwards an important revolution took place at Paris. Charles X. was driven from his throne, and abdicated; Louis-Philippe was chosen as his successor, with the title of King of the French. The revolution spread over the British islands as well as over the continent of Europe. In Great Britain and Ireland the people, preparing for the election of new members of parliament, we everywhere seized with an ardent desire for more liberal institutions, and the press was filled with the names of the constituencies which elected the members of the House of Commons.

The new parliament assembled on the 26th of October 1830, and the king's speech was delivered by William IV. on the 2nd of November. During the autumn which followed, Earl Grey, in the House of Lords, urged the necessity of an immediate reform of the House of Commons; and the Duke of Wellington, in reply, affirmed that "the country already possessed a legislature which answered all the good purposes of the state," and declared that "the full and entire confidence of the country," and declared that he was "not only not prepared to bring forward an immediate measure of reform," but would "resist any such a measure as long as he held any station in the government of the country. Public meetings were held throughout the country, which were attended by vast numbers. The Duke of Wellington opposed the Reform Bills steadily and frequently in opposition. Hence he became unpopular, and the bitterness of the feeling—at least of lower orders—may be inferred from the fact, that when returned from a visit to the Tower, June 18, 1832, he was met by a hostile crowd of 15,000, who jeered and insulted him. The windows of Apeley House were broken, and he afterwards protected them by casements.

The office of Chancellor of the University of Oxford became vacant by the death of Lord Grenville, January 25, 1834, and on the 29th of the same month the Duke of Wellington was unanimously elected to succeed him. To this period we may consider the commencement of the great French revolution, the revival of the Catholic question, the depression of trade, and the feeling was the prevailing one, which was the subject of conversation. The political party leaders were Masters, and was attended by a vast concourse of persons.

On the 8th of December 1834 Sir Robert Peel was gazetted as First Lord of the Treasury, and the Duke of Wellington as Secretary of State for Foreign Affairs. This first result of his elevation had the effect of rousing public sentiments, which were long placid, and the result of the general election was less disastrous than had been expected. Queen Victoria, and let
Melbourne retained the office of premier till August 30, 1841, when he resigned, and Sir Robert Peel again became prime minister. He chose as his Duke of Wellington to replace him in the Cabinet, but without taking office. After the death of Lord Hill, December 10, 1848, the Duke of Wellington succeeded him as Commander-in-Chief of the Forces, and continued uninterrupted to perform the duties of that office till the termination of his life. The Duke's last political difficulty occurred in 1846, when the repeal of the Corn-Laws had become a necessity. Sir Robert Peel saw the necessity: he knew that there would be a large majority in the Commons, but success in the Lords depended on the influence of the Whig party. The duke acted on his own responsibility, and Sir Robert Peel resigned office. The Queen then sent for Lord John Russell, but he was unable to form a ministry, and Sir Robert Peel was recalled. The Duke then saw the necessity of the repeal. He put aside his own opinion, stood by his action, and took the line of difficulty that he had held to the Queen and the Commons, and by his influence and his prolixity passed the measure through the House of Lords, May 26, 1846, by a majority of 47.

The leading characteristic of the Duke of Wellington's mind seems to have been sound good sense, based on patient examination into details, and a careful study of the whole n order to arrive at a right conclusion. He made allowance for contingencies, passions, interests, estimated things at their real value, and was rarely wrong. His great principle of action was, to take the line of difficulty, and to have the stimulus of glory or ambition. His manner was in general singularly calm. He never seemed to be elated by success, nor depressed by discouragements or difficulties. Quickness of decision and severity of decision marked his character during the whole of his life. He was not inflexible however in carrying out his plans as a commander or his views as a statesman; but altered his course when new information or a change of circumstances offered a sufficient reason for the change of general policy or of his opinion, or gave the House of Lords, and spoke frequently. His influence over the members of that House was such as probably never possessed by any other individual. As a public speaker, his delivery, without being fluent or rapid, was precise, his enunciation firm and clear, his voice round and melodious. He was temperate in the use of food and wine, slept on a hair-mattress on a simple camp-bedstead, was an early riser, and was ind-fatigable in his attention to business. He seldom made use of a carriage, and continued to ride on horseback when from the infirmities of age he could no longer sit erect, and he also used the exercise of walking even to the last, though his steps were slow and altering.

Weigel and Henrik Arnold, a very distinguished Norwegian poet and political writer, was born on the 17th of June 1806 at Christiania, where his father, Vikland, a clergyman, was one of the assistant masters at the Latin school. The father, who was much expected, was employed in collecting the materials of his history, and newspapers, has also had that of adding notes, which on some occasions were necessary to render them intelligible to those not intimately acquainted with the passing history of Norway at the time during which they appeared. Three volumes of the eight are occupied by Henrik Arnold's poetical works, 'Jan Van Huysum's 'Flower-Piece' and 'The Spaniards' are considered by far the best. One volume is filled with the fables: two others with dramatic poems. An early tragedy, entitled 'Sinclair's Death,' is founded on a well-known incident in the north of Scotland.

Ah!' It was afterwards followed by twelve other fables of a similar kind, some in verse and some in prose, and mostly full of moral lessons, all written in his last opinions and a reasoning of personalities. It was not surprising that these productions should arouse the animosity of the parties to whom they referred, and for the ten years from 1827 to 1837 Wergeland's life was passed in what is familiarly called 'hot water.' His controversies in the newspapers, some of which he occasionally edited, were very frequent; and his poems, many of which were on political subjects, were hardly less numerous. His admirers were at this time fond of calling him 'the Byron of Norway;' but Dr. R. G. Lecky has observed, 'Norway and the Norwegians' gives an interesting account of a visit to the correspondents of Europe, and that he might be called an 'Elliott Dando.' His political feelings were intensely felt, and his opinions on Norway and the Norwegians, and so narrow as to be antagonistic even to the other members of the Scandinavian family, the Danes and Swedes. For some time he drew the whole youth of Norway within, but in 1839 the appearance of an attack upon him by Welhaven, another rising poet and critic, 'Henrik Wergeland's Digtekunst og Polemik' (Henry Wergeland's Poetry and Polemics)—began to turn the current, though Wergeland's father wrote vigorously in his defence, and it may be that the present high opinion of Norway is in favour of the united action of the three Scandinavian countries. It was regarded however as a great triumph of Wergeland's views that in 1837, Sweden conceded the point of allowing a separate national flag to Norway. In 1838, the year before his death (October 17), Wergeland (Slette) paid a visit to Christiania, and Wergeland wrote a complimentary poem on the occasion, which was said to have been received by the sovereign with peculiar gratification. The Norwegian public was surprised to hear afterwards that the king and queen were not satisfied that the visit and the payment of the respects due to him would not have been better shown in a visit to Christiania. Wergeland, who was, with the exception of the king, generally regarded as the chief 'radical' of Norway, an annual pension from his own private purse, and a storm of indignation burst on the head of the poet. His position up to that time had been somewhat precarious one. So far as the literary public was concerned, he had been dismissed from his editorial situation after passing in 1839 an examination as candidate in theology, and officiating for some time as curate to his father. A poem which he had published, under the title of 'Creation, Man, and the Hebrews,' he published the same year as his father's poem, 'Creation, Man, and the Hebrews,' was similar in its style to his best work, and which many even of his admirers declared themselves unable either to admire or comprehend, contained views and opinions which were not considered compatible with the position of a minister of the church; and as a reward of his life's work, he was placed against him. On quitting theology he studied medicine; in 1836 he was appointed keeper of the university library, and in 1840 keeper of the Norwegian archives. Giving up political writing after his pension, he devoted himself to poetry; and though his reputation abroad was perhaps on the wane, the enthusiastic reception his predecessors had enjoyed, it is now acknowledged that they are the best of his whole career. In 1840 he married, and was enthusiastically attached to his wife. But his constitution, originally athletic and corresponding with his stature of six feet three, was irrecoverably shattered by an immoderate indulgence in brandy, and he died on the 12th of August 1845, at the age of thirty-seven.

A collected edition of the principal works of Wergeland was commenced in 1851 by the Student's Society of Christians, under the editorship of H. Lassen. The last volume we have seen of it is the eighth, published in 1856, and it was to be completed in nine. The editor, who had the task of collecting the whole works of the poet, and of including all his verse, was also responsible for the publication of the Wergeland's 'The Campbells,' and two tragedies, 'The Child-Murderess' and
The Venetians," are of particular merit. 'Creation, Man, and the Messiah,' is given in a revised and corrected shape, as left by the author. Of Webergeland's prose writings the most interesting article with some short biographies of distinguished Norwegians, and a history of the formation of the constitution of Eidsvold.

WERNERITE. [SOAPOLITE]

WESTALL, WILLIAM, A.R.A., younger brother of Edward Augustus Westall of Hertford. October 19, 1781. He studied at first under his brother, and subsequently at the Royal Academy. Here however his studies were interrupted, by his appointment, in 1801, on the recommendation of the President, West, to accompany Captain Flinders in the Lysithea, as his companion during his many voyages. Westall was with Flinders for two years, when, the Investigator having been abandoned, he was transferred to the companion ship, the Porpoise, in which he was wrecked on a coral reef on the north coast of Australia on his voyage home. The ship which did not get back to England was bound to China, and he remained some months in that country, when he secured a passage to India. Here he also remained some time, making a journey into the interior and occupying himself, as elsewhere, which proved destructive of all grander objects. Not finding, on his return to England, employment as readily as he anticipated, he made a voyage to Madeira and the West Indies; and on his return opened, in 1806, an exhibition of the large collection of water-colours which he had made during his travels in various countries he had visited: it proved however an unsuccessful speculation. Captain Flinders returned to England in 1810, and Westall was directed by the government to prepare his sketches for engraving to illustrate the account of the voyages. The work was completed, and the engravings were rendered them very attractive. They secured his election as Associate of the Royal Academy in the same year: he had for some time previously been a member of the Society of Painters in Water-Colours. Unfortunately, perhaps for his reputation, he was not subjected to the same treatment as his brother, and he was not in the public eye. His contributions to oil paintings to the exhibitions of the Royal Academy were comparatively few, and in his later years they became fewer than they might else have been, from finding himself in reality excluded from the full honours of that institution. Mr. Westall met with a severe accident, in 1847, by which his left arm was broken, and he received some internal injuries, from the effects of which he never wholly recovered. He died January 22, 1850.

WESTERN AUSTRALIA. A, in the north of the continent, extends about one-fourth of the whole continent, and comprehends all the countries lying west of 132° E. long., the boundary west of South Australia and North Australia; so that the boundary-line between it and the other parts of the continent joined, coincides with the line of the Swan River. And so near the coast of the Western Sea near the Australian Bight, at Cape Adien. Thus Western Australia contains about one-fourth of the whole continent, and lies between 30° and 14° S. lat., 115° and 133° E. long. The limits of the British colony, on land, which is included in the name of the Swan River Settlement, are much less, but the boundary has not been definitely settled, and is constantly being extended. It may be said to lie between 30° and 35° 8' S. lat., 115° and 119° E. long., or about 400 miles from south to north, and about 200 miles from east to west.

Coast. — The coast-line presents a much greater variety than most other parts of Australia. In some parts the sea to some distance from the shore is covered with numerous islands, islets, and rocks, which render these countries difficult of access. From this cause an extent of coast-line, about 600 miles in length, has not been surveyed. Tasman Land, between Point Gantheumne and Cambridge Bay, to the northward, has a coast more broken than any other part of Australia, and indented with wide bays, and some narrow inlets, which penetrate a considerable distance into the interior. The coast of Tasman Land has been but imperfectly explored, so that our information in respect of the natural products of the country is very limited. Within the confines of the colony there are numerous estuaries, each of which receives several rivers. Of the few good harbours along this coast, the most important is Port Bockingham in Cockburn Sound, Albany in King George's Sound, Banbury in Port Leschenhaut, and Augusta, near Cape Leeuwin, on the southern side of the south-western promontory of the island. At the mouth of the Swan River, and at the head of the Melville Water, which runs inland from the sea, in is the port. This port forms the colony of Western Australia. The entrance is encumbered and rendered dangerous by several rocks. A lighthouse is placed on Rottenest Island at the entrance, and on some of the more dangerous islets. The coast extends for 131 English miles, and is about 23 English miles in width, or 40,000 acres. The whole coast is broken by numerous bays and inlets, and the land rises gradually from the sea, and is level on the coast, and high land is distant about three miles.

Mountains, &c. — A range called the Darling Mountains extends along nearly the whole length of the colony. Its distance from the coast varies from 50 to 150 miles, and its height is from 900 to 3000 feet. It is generally sterile; the stones which form the surface are coarse, and a coarse herbage appears on the surface, and plants which resemble the English heath grow in considerable numbers. There are forests of large mahogany and blue gum-trees. In the Darling Mountains have been found roofing-slate, lime-stone, etc., and in the environs of the town iron-ore, magnetic iron-ore, chromate of lead, galena, and copper. Wide valleys bordered by fertile plains occur where basaltic rocks are developed. Columnar basalt is found around Geographe bay, and from thence to Shark Bay a band of coal has been traced from Boddington in Cockburn Sound, Albany in King George's Sound, Banbury in Port Leschenhaut, and Augusta, near Cape Leeuwin, in about 34° 30' S. lat.; Cape Leeuwin, in about 34° 30' S. lat., is the southern termination of the third range, which is inferior in altitude, as well as in extent, to the other two: it terminates at the mouth of the Grafton River, about 35° 27' S. lat. The highest point is Talbanong, which is stated to attain an elevation of 5000 feet. On the mountains and higher hills the surface is rugged and stony; on the lower sides of both the soil is excellent; but in the principal valleys and the thickly settled district of the colony, it is sandy, while in some form or other, it is of a very inferior description, except where the rivers have brought down an alluvial deposit.

Rivers. — The rivers on the west coast of Australia generally rise at no great distance from the sea. Near their sources they are traced by streams, and are slow and meandering. The Swan River rises on the western side of the Darling Range. At its mouth is a bar, after passing which the river is navigable, though with difficulty, for some distance. The other rivers are the Avon, the Murray, the Canong, the Harvey, the Preston, the Collie, the Vasse, the Blackburn, and the Moore. The Murray, the Collie, and the Avon rises in the Darling Range: it is smaller than the Swan, and only navigable for a few miles. Shoals impede the navigation, and in dry weather boats must be pushed over them for fully a 8 miles. The Murray, the Collie, and the Avon enters in the Darling Range, and empties itself into Peel's inlet. The Preston and the Collie unite about 50 miles south of the Murray, and the united stream runs into an estuary called Leschenault, and forms a bar, over which the river is very shallow.

For the botany and zoology of Western Australia, see AUSTRALIA.

Climate.—The climate of Western Australia has the same general character as that of Eastern Australia. [AUSTRALIA.], but is superior in health, while in the case of some persons it has proved highly favourable. Though variable, the western part of this colony
is not so uncertain as New South Wales in the supply of rain and moisture. The average winter temperature is about 58°, that of the summer about 76°.

The wet season begins generally in March and ends in November, when the rain being most abundant in August and September. The height of the dry season is during the harvest, in January, when the nights are distinguished by heavy dew. The seed-time lasts from early in May to the end of August. By December the grain is ripe: hay is cut in March. The cereals are cultivated on the flat; barley, oats, rye, flax, clover, field peas, and several others are grown. Cuttings produce fruit the first year, and vines the second or third.

Population.—The aborigines do not amount to more than 170,000. The European population now amounts to 270,000.

In 1852 it amounted to 6711, including 705 enumerated among the military, 1433 bond, and 6674 free. According to an official return, Dec. 31, 1865, the European population was 12,515, of whom 8536 were males, and 4979 females. They are distributed as follows: 12,515 of whom 8536 were males, and 4979 females.

The convicts and their families, and the officers of the colony are divided into government purposes into 32 counties. On the first establishment of the colony in 1828, it was decided that no convicts should be sent thither, and a system of colonisation was projected, to be carried forward under the supervision of the Wesleyan Methodists, in which they did well. The labourers sent out became landowners, and hired labour became excessively dear. Convict labour has since been requested by the colonists, and has succeeded well; but it prevents free emigration to a considerable extent, for as the convicts are employed on agricultural work, the demand for free labour is not large nor constant. The assisted emigration in 1855 was only 93, and the landsales in 1856 only amounted to 1779 acres. The public works had been executed under the superintendence of the Royal Engineers, and consisted of the permanent prison at Fremantle; commissariat stores and offices at Fremantle, Guildford, York, Toodyay, and Bunbury; jails at York, Toodyay, and Bunbury; 272 miles of road made; 38 bridges built, one of which, over the Swan at Guildford, is 480 feet long, and another 250 feet long, built at Fremantle as a landing from the river, and another 455 feet long, as a landing from the harbour; the lakes at the back of Perth drained, and the swamps in Fremantle filled, and the supplies we had on hand were all used. The convicts had on the whole been good, and considerable improvement had been developed in their characters.

Commerce.—Though most of the English grains are grown, and the soil is tolerably productive, the exertions of the settlers are chiefly directed to the raising of stock. Wool is one of the chief articles of export; horses, which are sold to supply the cavalry at Madras, are another large article of export; as is sandal-wood, and a species of mahogany, of which there are large forests in the interior. Guano has been found in considerable quantities in the bay of Shark's Bay. Attempts have been made to prosecute the whale fishery; and something is being done in fishing off the coasts to furnish provisions for the inhabitants. There are many salt-lakes and springs, and a considerable quantity of salt is manufactured.

Dredging.—At Prevelly Point the choice of the course of navigation is made, and from this point the tide belongs to the right side of the estuary of the Swan River, near its junction with the Canning. The population is small. The town is however improving, but the houses are scattered over a large area. A bridge is now being built over the estuary of the Swan River, and there is a new jail. Fremantle is on the opposite side of the Swan River estuary, a few miles lower down. It is the seat of the convict establishment, and there is a jail. A lighthouse has been erected upon Arthur's Head, a promontory in the vicinity of Fremantle, and another from the harbour. Albany is a port-town in the south-eastern part of the colony, in King George's Sound.

It has a jail, and some trade in timber. Augusta is a small port on the eastern side of Cape Leeuwin, on the estuary of the Blackwood River. Bunbury is the port town of a district formerly called Australind, of which a small village still retains the name. The harbour of Port Levenham, upon which it stands, is a good and large one, but it has little commerce. Geraldton is an inland town on theMurdoch River, founded in consequence of the commencement of the working of lead-mines there by a company. Guildford is a small town, on the Swan, and is the seat of a college. Northam is a small inland town, in an agricultural district, east of the Darling Range, on the river Mortlock, and is about 80 miles in a direct line E.N.E. from Perth. Rockingham is on Cockburn Sound, and has a good port, and some trade. The town of Swanport is on the Swan River, about 64 miles from Northam, and about 50 miles N.E. from Perth, upon the river Toodyay, which pierces the Darling Range, and falls into the Melville Water, but is not navigable. Vasse is a small port on Vasse Inlet, in the洌 Computers Bay, about 30 miles S.S.W. from Bunbury, about 56 miles S. from Vasse, across a fine country, forming the promontory bounded by Cape Leeuwin and Cape Naturaliste. Other small towns of little importance are named York, Picton, Cervantes.

WESTMACOTT, SIR RICHARD, R.A., was born in London in 1775. His father was a sculptor of some eminence in his day, and in his studio (Mount-street, Grosvenor-square), the young Westmacott learned the use of the chisel. In 1793 he was apprenticed to Canova. His career as a student in Italy was a distinguished one. He carried off the first prize in sculpture at the Academy of Florence, in 1794; and in 1795 the medal given by the pope. He was elected a member of the Royal Academy of Florence in 1795, and after what prolonged stay in Italy, he returned to London, and was soon recognised as one of the best of the young sculptors of the day; and his future career was on the whole a very prosperous one. His images of the Empress Josephine were unusually graceful, chaste, and poetic character, classic in feeling, and in execution resembling that of the modern Italian school; several of these will retain their place among the best poetic works of the English school of sculpture. The most popular of his works are: 'Fanny,' executed for the Duke of Bedford, and now, with a companion 'Cupid,' at Woburn. Among the best known of his other poetic works are the 'Hyppocrite,' executed for the Duke of Newcastle; an exquisite figure of 'A Nymph unclasping her Vest,' the property of the Earl of Carlisle; 'The Distressed Mother,' executed for the Marquis of Lansdowne; 'The Homeless Wanderer;' 'Devotion,' &c. He also executed several important works in alto and bas-relief; one of the first of which was probably his portrait of the friars in the Manresa Convent, near Barcelona, and of other portraits being Flaxman and Baily. His latest work in this style was the pediment of the British Museum. He also executed for the late Earl of Egremont, a large alto-relief in marble in the east end of St. Paul's Cathedral. He was born at Petworth. A large portion of his time was however occupied, and much of his reputation now rests, on public monumental statues. Of these it will suffice to mention his statues of Pitt, Fox, Spencer Perceval, and Addison (1809), which, with his monuments of the Duke de Montempsier, and Mrs. Warren, and her Child, are in Westminster Abbey; Sir Ralph Abercromby, Lord Collingwood, and Generals Pakenham and Gibbs, in St. Paul's Cathedral; Lord Erskine in the Old Hall of Lincoln's Inn; Fox in Buckingham-square; Flaxman in the garden of Bethnal Green, and Flaxman and Baily the Duke of York on the column at Waterloo-place. The so-called 'Achilles,' copied from the statue at Monte Cavallo, Rome, and inscribed by the Women of England to the Duke of Wellington, was modelled by Westmacott, but whether he executed it is uncertain. His taste, or that of the women of England, we do not know.

Westmacott was elected A.R.A. in 1805, and R.A. in 1816. In 1837 he succeeded Flaxman as Professor of Sculpture. He died at 61, on the 21st June 1856, and was interred at Westminster Abbey.

Webley's [Whale's].

WHEATON, HENRY, an eminent American diplomatist.

65.
and writer on international law, was born at Providence, Rhode Island, U.S., in November 1785. Having completed his education at Brown University in his native city, he graduated there in 1802; studied law under Mr. N. Seely, and was admitted to the bar. He then passed a couple of years in Paris and London, during which he acquired considerable acquaintance with civil law, and rendered himself a complete master of the French language. On his return to America he settled in New York; commenced practice in his profession, and in 1812 became editor of the 'National Advocate.' He continued in this capacity for three years with merited success. He contributed to it, among other things, a series of disquisitions on the law of nations. In 1815 he was appointed one of the justices of the Marine Court, and the same year he published a 'Diges of the Laws of Nations.' For these and other learned speculations. He was appointed in 1821 a member of the committee for revising the constitution of New York; and in 1825, a commissioner for revising the laws of that state. He resigned his offices, however, in 1831, and thereafter devoted himself to his profession. He was appointed in 1801 a member of the commission for revising the constitution of New York; and in 1825, a commissioner for revising the laws of that state. He resigned his offices, however, in 1831, and thereafter devoted himself to his profession. He was appointed in 1801 a member of the commission for revising the constitution of New York; and in 1825, a commissioner for revising the laws of that state. He resigned his offices, however, in 1831, and thereafter devoted himself to his profession.

WIFE AND HUSBAND. The chief alterations in the laws affecting the relation of husband and wife have been already stated, but may be shortly summed up in this place. The laws of the Wife. In all countries the wife is compelled to protect her earnings from him or his creditors, and she will then be able to contract as if she were a feme sole. (20 & 21 Vict. c. 85, s. 81). When the desertion of the husband extends over a period of two years, or when he treats her with cruelty, the wife may obtain a judicial separation. (Separation, § 2.) When the husband commits incestuous adultery, or to adultery adds the crimes of bigamy or rape, cruelty or desertion for two years, or is guilty besides the adultery of an unnatural offence, the marriage is dissolved by the Act 39 & 40 Vict. c. 85, § 121. The Act 30 & 31 Vict. c. 85, which has effected these alterations in the law, makes various other provisions, for which however the statute itself must be referred to.

WIFFEN, JEREMIAH HOLME, was born in the neighbourhood of Woburn, in the county of Middlesex, and was educated for the profession of a schoolmaster, a vocation which he followed for several years. He very early however displayed a taste for poetry and literary composition. In 1816 he published a 'Geographical Primer,' for the use of country schools; and in 1818-19 he contributed some poetical effusions of considerable merit to a volume entitled 'Poems by Three Friends.' He next wrote some spirited stanzas on the portraits in Woburn Abbey, inserted in the Rev. Mr. Parry's 'History of Woburn,' and several other pieces of the same kind. In 1819 he published 'Aonian Hours,' and other poems, which attracted the notice of the Duke of Bedford, who appointed him his librarian at Woburn, and his private secretary. From this time he lived in the enjoyment of literary leisure, but continued to employ himself actively. In 1890 he published 'Julia Alpinus, the Captive of Stamboul, and other Poems;' in 1892, a translation of the poems of Garciilaso de la Vega; and for many years he contributed original poems and translations to 'Time's Telescope,' and various other periodical works. Among the original pieces may be mentioned 'The Luck of Eden Hall,' as a successful effort in the old ballad style. In 1830 he published a translation of Tasso's 'Jerusalem Delivered,' on which he had been working for several years. About the same time he wrote a Spensian stanza, and the versification is free and flowing, but as a whole it is certainly not calculated to supersede the bold and vigorous translation by Fairfax. In 1833 he published in one 8vo volume 'Historical Memoirs of the Ancient Constitution of the British Empire, and of the decayed, and we were ready to offer a prize for a treatise on the subject;' it was published at Leipsig in 1841, under the title of 'Histoire du Progres du Droit des gens en Europe depuis la Paix de Westphalie jusqu'au Congres de Vienne, avec un precis des Operations des Institutions de juridiction des gens en Europe depuis la Paix de Westphalie.' The author afterwards remodelled the work, and published it in English in one thick volume (New York, 1845), under the title of 'History of the Law of Nations in Europe and America from the Earliest Times to the Treaty of Washington.' In the latter part of the same year he published a second part of the work. Mr. Wheaton continued after his return to America to pursue his usual studies. He had even accepted the offer of the chair of International Law in Harvard University, and was preparing to enter upon its duties, when he was suddenly cut off on the 11th of March 1848. Since his death there has been published a fourth edition of the 'Elements of International Law.' By the late Hon. Henry Wheaton, LL.D. Revised, annotated, and brought down to the present time, with a Biographical Notice of Mr. Wheaton, and an account of the Divers Transactions in which he was concerned. By Hon. William Beach Lawrence, formerly Chargé d'Affaires at London.'
though with pardonable partiality. He latterly studied Hebrew and Welsh, from the last-named of which he made himself successful poetical translations. Mr. Willems main-
tained his connection with the Society of R. M., his officers of trust in it occasionally, until his death, which took place suddenly on May 3, 1866, at Woburn Abbey.

WILL AND TESTAMENT. The "Wills Act."—Viet. c. 8. was passed in 1567. It was more in the nature of a code. Simple apparently as are the requirements of the first statute, an immense number of questions had arisen upon the lan-
guage of its provisions; and probate had over and over again been refused to wills, the authenticity of which was beyond doubt, and which were, in fact, quite in accordance with the specimen of legislation; as the simple perusal of it will show, that it is passed not to amend the law, but to provide against the consequences which have been held to follow from the negleci gence of testators, in not paying strict attention to that aspect of the Wills Act, which requires the instrument to be signed at the "foot or end."

WILLES, JAN FRANS, the originator of what is called the "Flemish movement" for the revival of the cultivation of the Dutch language in Belgium, was born at Bouchout, a village near Antwerp, on the 11th of March 1756. The French sans-culotte army, under Dumouriers, was at that very time advancing to the siege of Antwerp; a party of his soldiers entered Bouchout on the night that Willems was born, and a certain politely-witted youth from his father's house, observing that the first French citzen of the district would be the first French citizen of the district, and little foreseeing how effective an opponent he would prove to the influence of French in Flanders. The attachment of Willems to the Flemish language, and his hatred of French, and of Frenchmen, where he was sent from the age of twelve to fifteen, to learn singing and playing on the organ, and where he was fortunate enough to meet with a protector and educator in the person of Mr. Bergmann, who, in the then cessation of public means of education, and in the habit of getting up theatrical entertainments. "The Cecilian Society of the principal church, St. Gummars, where I every day sang or played the organ, being," says Willems, in a history which he after-

In 1770 he became a tax-collector. This and some other proofs of talent led his patron Bergmann to advise his parents not to bury him in the obscurity of his native village but send him to Antwerp, where he found a position with the auditors of the Bank, and contended victoriously against twenty-six competitors for the post that was offered for the best poem on the battle of Friedland and the peace of Tilsit. An amateur theatre was his favourite recreation, and two plays of his composition, "The Rise and Rise of Joseph," and "The Return of Lot," were produced with success both on the stage and in print. The union of Belgium with Holland, which followed the overthrow of the French dominion in both countries in 1814, naturally directed attention to the fact that the so-called Flemish language, and the Dutch, were only very slightly differing dialects of one common language which was at one time more cultivated in Flanders and at another in Holland. Willems took the lead in reviving and making permanent what it is very singular should ever have been overlooked or forgotten. A spirited poem by him—

Aen de Belgien" (To the Belgians)—published in 1816, rehorted his countrymen not to continue to abandon the language of their fathers, which was also the language of Vondel and Bildersdyk. This poem, which produced a strong sensation, was accompanied by a French translation, which it may be reckoned was as faithful as the original. It formed the basis of some of Willems's "Discourses on Flemish Language and Literature in connection with the Southern Provinces of the Netherlands" ("Verhandeling over de Neder-
dytsche Taal- en Letterkunde opgeteekt by Zugdeleyk Pro-
blems," Groningen, 1816), which appeared in 1816 and completed in 1824. In this work, which extends to two octavo volumes, he aimed at tracing the literary history of Flanders and Brabant from the 13th to the 19th century, showing that literature had flourished in those countries as early, as the national language was cultivated, but that it had declined since the religious wars which led to the separation of the North and the South Netherlands, because from that period Latin, and particularly French, had been looked upon as the only instruments of literary cultivation in the Catholic part, while the use of the native dialect, or of nearly akin to it, had been abandoned to the Protestants of the Seven United Provinces. There was an outcry against the author of this work on two accounts, one from the antagonists of the union of Belgium with Holland, who attempted to prove that Willems's work could not contribute to the safety of the country, and another from the Vestey Protestants North to the Catholic South. The dissertation had great value at the time of its appearance as the only attempt at a connected history of Flemish literature, but the additional light since thrown on the subject by th- researches of other men of letters has somewhat lessened the value of rendering it in some degree obsolete. From the time of its publication Willems was looked upon as the champion of the Flemish cause, which he defended against all enemies and in particular against Van de Weyere in a French pamphlet, an anti-liberal literature, in 1824. Willems died on May 18, 1839, only a year before the violent secession of Belgium and Holland.

The revolution of 1830 appeared at first sight to be a mortal blow to the prospects of the Flemish language, and also to the fortunes of its champion. Willems had been placed by the Dutch government in the advantageous post of a receiver of some public dues at Antwerp, where he had been previously appointed by the city as an assistant keeper of the archives, and had also, in conjunction with Van de Weyere, one of the first commissions and established the archives and monuments of the South Netherlands. Of these posts he was deprived by the provisional government of Belgium, and sent in an obscure position, with a reduced salary, to the provinces of Limburg and Luxembourg, which the Dutch government to place him in a more advantageous position in Holland, he remained for four years. By that time the indignant remonstrances of some of the chief literary men of Belgium, and in particular of his old opponent Van de Weyere, aroused the government to a sense of its unworthy treatment, and in 1833 he was placed at Ghent in a situation similar to that he had occupied at Antwerp. While at Eecloo he had published a modern Flemish version of the celebrated medieval poem of ' Reynard the Fox,' which he had translated into Dutch. His passions were still maintained, and an old Flemish manuscript of the poem at London, in the auction of Richard Heber's library, he applied to the Belgian government to secure it for Belgium; it was purchased at his recommendation for 1800 francs, and is now preserved under his editorship with a preface, in which he maintained his views with great ability. From this time his life flowed in a course of literary labours and honours. A society was formed at Ghent "for the encouragement of the Low-Dutch language and literature," and in 1835 Willems was elected its president, under the editorship of Willems, which was so entirely his work, that at his death it suddenly ceased, and was brought to a close, with, for its last article, the life of Willems, from which this notice has been chiefly based, a Scotch translation of some of the most interesting matter. The cultivation of the Flemish lan-
guage, which he had first promoted, went on increasing. In 1841 a Flemish festival was held at the University of Ghent;
two years later a meeting of the ‘Tasverbond,’ or ‘Language Association,’ at Brussels, at which Willems officiated as president. The movement was too powerful to be withstood by the government. Willems had no longer to fear dismissal for his endeavours, and had already in 1826, been knighted a name of the order of Leopold. The Flemish movement still appears to make progress, and the meetings which have been held of distinguished literary men of both the North and South Netherlands appear likely to result in plausible hopes. Willems’ opinion in Painting in Flanders than it has been for centuries. Willems however was not destined to witness this triumph. He died at Ghent on the 28th of June 1846, after a very brief illness, of an apoplexy.

His works, according to the list given in the ‘Belgisch Museum,’ are 43 in number, 35 in Flemish, 5 in French, and the remainder in both languages. The most important that have not been already mentioned are his ‘Mengelingen van vaderlandschen Inhoud’ (Miscellanea on National Subjects), Antwerp, 1827-30; the ‘Rhymed Chronicle of Jan van Heeul;’ the ‘Rhymed Chronicle of Brabant, by Jan de Klerk,’ edited for the Belgian Historical Commission; and the ‘Chronicle of Edward the Third, king of England, written in the Congress of Paris, by Jan de Klerk,’ and first published by Willems at Ghent in 1840.

WILLIAM II. (FREDERICK GEORGE LOUIS), King of the Netherlands and Grand Duke of Luxembourg, was born on December 6, 1792, and under the care of his father, was soon learning military subjects, and completing his education in the university of Oxford, where he showed much talent. He entered the military service early, serving his first campaign with the English army in Spain, and was in the battle of Talavera, his rank of lieutenant in the Spanish service. His courage and activity procured him the esteem of the Duke of Wellington, who made him aide-de-camp. At the siege of Ciudad Rodrigo he was among the foremost in the storming party, and at that of Badajoz he entered the city carrying the English colours, which he re-entrained as he had checked. He also distinguished himself at the battle of Salamanca, and on other occasions, for which he was promoted to be aide-de-camp to the king of Great Britain. When in 1814 his father was restored to his kingdom, the Belgians required him, also as a reward for the victories he had won. In 1815 he commanded the army of the Netherlands, and displayed bravery and military skill in the battle of Quatre Bras, and in that of Waterloo, at which he headed his troops, and was wounded in the shoulder. On his return he attended the Congress in Paris, and here was made the proposal of his union with the Princess Charlotte of England, which however failed, because, it is said, the prince was unwilling to become an English subject only, even if the first; and because the marriage was refused by the authorities of the emperor of Russia. On the breaking out of the revolution in Belgium in 1830, he repaired first to Antwerp and then to Brussels, where his appearance made a great impression. But his endeavours at a reconciliation failed, and the revolution was brought to a successful issue. On October 16 he recognised the independence of Belgium, for which his father immediately cashiered him, and he withdrew to England, whither he brought his two eldest sons to be educated.

In the following year however he was recalled to the command of the army of Holland in the short war against Belgium, in which he was at first victorious, but was at length compelled to retreat by the armed intervention of France. He was then appointed to the command of the army of occupation in Flanders. His father, on October 7, 1840, he succeeded to the government, in which he showed great regard to economy, and a desire to promote financial improvements, but opposed all constitutional reforms. On the breaking out of the revolution in Cambridge in 1848, he was forced to consent to extensive changes, which probably might have been avoided by smaller concessions made earlier. He did not however live long to witness the effect of the alternations, as he died on March 17, 1849.

WILLIAMS, EDWARD, a painter, was born at Kidderminster, Worcestershire, on 2nd September 1756. He received his first instructions in drawing and painting, he was at the usual age apprenticed to a printer in his native town. While serving his apprenticeship however he taught himself etching, and subsequently wood-engraving. So attached had he become to the latter art, that on the expiration of his term of service he determined to adopt it as his calling, and, possessing some skill in design, he found employment with the lower order of grown men in the trade, and gradually rising in station and position, became one of the leading artists in the line of wood-engravers, and at the same time one of the best designers and wood-engravers of his time. His earlier engravings executed for Whittingham’s Novélies et Poésies, for Willemen’s ‘Tasso,’ and the architectural illustrations in Magasin des arts, Galeries de la Reine, display qualities strikingly apparent in his vigorous, characteristic, and original, though occasionally somewhat rude design. His later engravings for Hone’s ‘Every Day Book,’ in his later engravings and designs—as those in Howitt’s ‘Rural Life,’ Scraps’ ‘Days of Salmon-Fishing,’ and Deer Foraging’—showed ‘Seasons,’ &c.—he shows much more elaboration and neatness, with an equal evidence of the devoted study of rural life and scenery, but perhaps some loss of power. Throughout life he retained his early ambition of painting in oil, but we are not aware that he executed any works of conse that branch of art. He died on the 19th of September 1853. Two of his sons still sustain the reputation of the name of Williams as wood-engravers.

WILLIAMS, EDWARD, a PESSOR, was born on the 19th of May 1758, at Paisley in Scotland, where his father was a wealthy manufacturer. He was the eldest son: one of his brothers, James, became distinguished as a naturalist; one of his sisters became Mrs. Ferrier, and the mother of Procter and Chadwick. He was educated at a school in the village of Kilbarchan, and was married Sir John Macneil. At an early age, the future poet and essayist was sent to a school at Glenorchy in the Highlands kept by the Rev. Dr. Joseph McIntyre; and here he acquired his first enthusiasm for Highland scenery and his love of natural history. At nineteen he went to the University of Glasgow, whence, after five years of study, he removed in 1803 to Magdalen College, Oxford. At Oxford he was distinguished no less for his literary genius and attainments—as shown in his carrying off, among other honours, the Newdegate’s fellowship in 1806, for an essay upon ‘The Study of Greek and Roman Architecture,’—than for the exuberance of his animal spirits, his great physical strength and beauty, and his fondness for athletic sports. He was the best boxer, wrestler, and archer in the University. He graduated B.A. in 1807, and in 1810 he obtained the degree of M.A. “A fair-haired Hercules-Apollo,” says a writer, sketching his life at this time, “and with plenty of money enabling him to gratify his tastes whatever they might be.” He married in 1811, Miss Scott, the daughter of a double character by purchasing, or having purchased for him by his father, the small, but beautiful estate of Elleray on Lake Windermere, where as Hercules, he might yachting about at his pleasure, beat the best boating at the ear, and wrestle with the best in the wrestling-match. But the chief charm of Elleray is that there in the quiet beauties of the finest of English scenery, indulge undisturbed in poetic dreams of his own, and cultivate with due reverence the society of Wordsworth.” Here, besides Wordsworth, he became acquainted with Coleridge, Southey and Dr. Unish, the last of whom describes the extraordinary manliness of his character at this time, dazed with an eccentricity which showed itself in all kinds of freaks and projects—and among them that of becoming a fisherman. “Fishing was his real vocation (1810) that he married an English lady of wealth whom he met where she was on a visit to the Lakes with her family, and falling in love with her at first sight, wooed and won with romantic rapidity. He had by this time published some anonymous poetry, and in 1812 he published a volume of Miss Scott to Miss Joanna Baille and will show the impression which he had begun to make in Edinburgh: “The author of the Elegy upon poor Graham is John Wilson, a young man of very great and numerous poetic powers. He is now engaged on a poem called ‘The Life of Falstaff,’ and another in verse by Southey. He is an eccentric genius and has fixed himself on the banks of Windermere, but occasionally resides in Edin-
burgh, where he now is, . . . He seems an excellent, warm-hearted, and enthusiastic young man; something too much perhaps of the latter quality places him among the list of originals." The 'Isle of Palms' here alluded to, was published in 1818, and gave Wilson a place among the Lake Poets. In 1813 he was called to the Scottish bar; at which he however never practised; and from that time forward Edinburgh was his accustomed place of residence. He wrote for the 'Edinburgh Review' a criticism on the 4th canto of Childe Harold—"his only contribution to that periodical. 'He was a better writer,' says Mr. Purdon, "than to attach himself to the little band of young Tories, with Scott as a cautious veteran to advise them, who were disposed to break out in rebellion against Jeffrey's Whig supremacy in the northern world of letters; and, accordingly, when Blackmore failed, he rose in 1824 and 1826, and in a native Scottish Toryism similar to that which had been already provided in the 'Quarterly Review' for British Toryism in general, Wilson was one of the first to join him. He had lost his high opinion of Burke, as one of those statesmen—so says by the publication (1816) of a poem of some length, entitled 'The City of the Plague'; his magnificent physique was the admiration of Edinburgh, so that, as he walked hurriedly along Princes-street in somewhat wild costume, and with his hair flung over his ears, even pausing to look at the passers by, were turned to look at him; and his reputation in social circles was that of a young Goth of genius with powers undeveloped, which would one day astonish Britain." At first Wilson was associated with Lockhart and others in writing for 'Blackwood's,' as that it to not till 1834 or 1836, that that publication was identified with him to the full extent.

The connection with Blackwood was an important event in the life of Wilson; and it was speedily followed (1830) by his departure to Dollar, and thence to the University of Edinburgh, then vacant by the death of Dr. Thomas Brown. The appointment was made rather on the grounds of Wilson's political opinions and his promising genius than on the evidence of any special literary proficiency. His first published work was the edition of Sir William Hamilton, afterwards Wilson's colleague, was a defeated candidate on the occasion. Scott, who used all his influence in behalf of Wilson, wrote to Lockhart expressing his hope that the former would not be disappointed, 'for the consistency and steadiness of character which are all he wants to make him the first man of the age.' The appointment, together with his connection with Blackwood (both of which came at a time when some pecuniary reverses had obliged him to leave Edinburgh), gave him the necessary opportunities. He had, at all events, the good effect of determining Wilson's genius permanently to prose rather than to verse. He still, indeed, wrote verse in the Lakist style in quantity sufficient, when added to what he had already written, to make two octavo volumes, "that in verse he would ever have been more than one of the minor Lake poets. It was in prose, and more especially as a poet in prose, that his genius was to display itself in its full capacity; and both the magazine and the lecture room gave him the necessary opportunities. Some of these tales, with others written independently, formed collectively his first professor prose-work, published, in 1822, under the title called "The Union of the Real Life,' and followed in 1823 by a one-volume novel called 'The Trials of Margaret Lyndsay.' He wrote also political articles on the questions of the day, in which he blazed out as a Tory in a manner heartily satisfying to his instincts, and yet of the highest literary quality; and his attacks on the criticisms, in which he advanced and expounded canonaries of taste, especially in poetry, deeper than those of Jeffrey, and vindicated against that critic and his disciples the poetic claims of Wordsworth and the writers associated with him. He wrote, either as lectures or as articles, subtle philosophical disquisitions, not very connected or systematic perhaps, but gleaming with brilliant ideas, and tinged throughout with that rich and highly-coloured mode of metaphysics which Coleridge was diffusing through England. Lastly, careless of the formality commonly attached to the gown of a Scotch professor, and that the gown of a professor of moral philosophy, he wrote papers for the magazine in which he was seen relapsing ideally into his character as an untrammelled human being, a bruiser at country-fairs, a sportman on Scottish hills and rivers, a boon companion among bacchanals, commenting on men and manners, on life and literature, from the point of view of an inspired king of the gypsies or from amid the uproarious conditions of a city orgy. Among these papers of riotous phantasy, the most famous were the series called the 'Noces Ambrosianes,' a sort of imitation of the splendid "De Sancta Union," as well as Wilson, was a contributor to Blackwood, but which, taken up in 1826 by Wilson for himself, after Lockhart's departure for London, were continued by him till 1836, when the death of the Ettrick Shepherd, their principal contributor, finally ended the series. Several of these 'Noces' that carried the name of 'Christoper North' over the world as the pseudonym of Wilson. They were followed by a series called 'Dies Boreales,' which extended to nineteen volumes and went through five editions.

After the death of his wife, which took place about 1840 and left a profound sorrow in his heart, Wilson was much less active than he had till then been. He still figured as Christopher North in many papers in 'Blackwood'; in '1842 he wrote a tragedy, under the title of 'The Letters of Christopher North,' a selection of his contributions to the magazine; and still as 'The Professor' he was one of the lions of Edinburgh society and the idol of successive classes of students to whom he lectured his moral philosophy from the backs of the seminar rooms. He lived 'till the very last among his friends; but no more in his usual high-rang at the end of every eloquent period; but on the whole, the best of his career was over. Latterly, too, ill-health reduced his once abundant vigour. He continued in the discharge of his professional duties till 1852-3, when he was created a baronet. In 1857 a baronetcy with a year had been granted to him by government. He lived for a time in retirement at Lasswade, near Edinburgh; and died at Edinburgh on the 3rd of April 1864. In the following year his nephew, Professor Ferrier, who was also his stepson, became a member of the University of Edinburgh's council. Twelve volumes have appeared, including the 'Noces Ambrosianes,' the 'Essay on Burns,' which was published separately long ago ; the 'Tales'; and the Poems. The series of volumes will be continued by Mr. Wilson, who will write a biography of their distinguished relative.

WILSON, GENERAL SIR ROBERT THOMAS, the son of Sir Benjamin Wilson, a painter in Bloomsbury, was born in 1777. Having been educated at Westminster and Lincoln's Inn, he was commissioned an ensign in the 3rd Dragoons; by a daring act he saved the Emperor of Germany from being taken prisoner at Villers en Conche. He subsequently served in Ireland during the rebellion of 1798, and also in Holland, and in 1802 succeeded to a majority in Hoopsech's Mounted Rifles. He also for a time held a military command in the South West District. Having served for a short time in the Brazil and at the Cape of Good Hope, he was sent on a secret mission to the Continent under Lord Hutchinson. In 1808 he superintended the embarkation of a regiment of Portuguese refugees, and raised and formed the Lusitanian Legion. He afterwards commanded a Spanish Brigade under Sir Arthur Wellesley, and in the battle of the Pyrenees, in 1814 he was British military correspondent at the headquarters of the allied armies, and for some time held command of the Prussian reserve; at the head of this force he drove back the French to Lützen. He incurred the disfavour of his sovereign through the escape of Count Cunaulte, who had been condemned to death as an accomplice of Napoleon. A narrative of this adventure may be found in the "Gentleman's Magazine," vol. 69, part 1. p. 636. On the funeral of Queen Caroline he expressed his disapprobation of the court, and its connection with the government with respect to that unfortunate lady, and in consequence was dismissed from the army and deprived of the many foreign orders which he had won by his gallantry. He sat as member for Southwark, in the Liberal interest, from 1818 till 1831, when he retired in favour of Mr.
Brougham. Having been restored to his rank in the army, he became a general in 1841, and held the post of governor and commandant of Gibraltar till 1849. He died suddenly in 1850, soon after his return to England, May the 9th, 1849. He was the author of a translation of General Regnier's 'Campaign in 1801 in the East and in Egypt,' and afterwards of a more correct original narrative of those events, printed in 1819, under the title of an 'Historical Account of the British Expedition to Egypt.' His other publications were 'An Enquiry into the Military Force of the British Empire' (1804), 'Campaigns in Poland with Remarks on the Russian Army' (1811), and a 'Sketch of the Military Policy of Russia.' A work which was severely criticised at the time of its appearance in the 'Quarterly Review.'

Sir R. Wilson replied in an animated pamphlet.

WINT, PETER DE, was born at Stone, in Staffordshire, in 1764. He was apprenticed to Raphael Smith, the mezzotinto engraver, and had for a fellow pupil Philip Lutken, the Academisian, whose sister he afterwards married. Abandoning engraving, Mr. De Wint adopted painting in water-colours as his line of art; and was elected a member of the Society of Painters in Water-colours, in 1810, six years after its foundation. For nearly forty years his pictures were among the leading attractions of the annual exhibitions of that society. He painted almost exclusively home scenery:—VIEWS in Kent, Lincolnshire, &c.; among the lakes and moors of Westmoreland, in the Vale of York; oats the Thames, the Wye, and other rivers; corn-fields, hayfields, water-mills, and the like, being special favourites with his pencil. His style was broad, bold, and vigorous, his colour treach; and in general effect his pictures represent an unadulterated interpretation of the naked scenery. But he was wasting in refinement, and in aiming at breadth of effect he was often negligent of details. His touch and texture were peculiar; but, allowing for an almost inevitable mannerism, very agreeable and effective. Avoiding all the meanness of the small master, he was full of grandeur and vigour, and his pupils and contemporaries for producing force and brilliancy, he to the last continued to paint according to the method of the founders of the English school with washes of transparent colours only; but, as he was in power and position, he, to some extent, made up in clearness and freshness. He died on the 30th of June, 1849, in his sixty-sixth year.

WOODSTOCK. [CANADA, S. 2.]

WORDSWORTH, REV. CHRISTOPHER, D.D., was born July 6, 1774, at Cockermouth, Cumberland. He was the second son of John Wordsworth, attorney-at-law, and was educated at John Wordsworth, attorney-at-law, and law-agent to Sir James Lowther, afterwards Earl of Lonsdale, by Anne, only daughter of William Cookson, a mercer at Penrith. The Wordsworths came originally from Peniston, in Yorkshire, and built, in 1620, the House in which Wordsworth was born. He and the name of Wordsworth's maternal grandmother was Crackanthorpe, of the Crackanthorpe's of Westmoreland. The poet was therefore by pedigree a thorough North-of-England man. He had three brothers—Richard, who was the master of the Grammar School at Kendal, and was succeeded in 1816; John, who was nearly three years his junior, and who became commander in the navy, and perished by shipwreck off Wymouth in 1805; and Christopher, the poet's brother. He married Anne Coventry, daughter of John. He had also a sister, Dorothy, born between William and John. The mother of the family died in 1778, when the poet was only eight years old; the father died in 1783, when the poet was but thirteen.

About the time of his mother's death, Wordsworth's early life was spent partly at Cockermouth and partly with his parents at Penrith, where he attended a dame's school; but about that time he was sent, with his elder brother, to a public school at Haweshead, in Lancaster, whither his two younger brothers followed him. He did left very much at liberty to read what he chose, and to wander about in the neighbourhood. "I read," he says, "all Fielding's works, 'Don Quixote,' 'Olive Gray,' and any part of Swift that I liked; 'Gulliver's Travels' and the 'Life of Sir Roger de Coverley.' When I was about both in his father's house, in the time of his father, he first began to write verses, as school-exercises, and to store his memory with observations of English rural nature. He became a fair Latin scholar, and was taught something of mathematics; but, upon the whole, the acquisitions possible in the school were not great. On the death of Wordsworth's father, which occurred while he was still at school, it was found that the principal part of his property consisted of a debt of 5000l. owing to his estate by Lord Lonsdale; a considerable part of which was secured in a lawsuit with a view to recover this; but enough remained, when scraped together, to complete the education of the children, under the guardianship of two uncles. By them Wordsworth was sent, in October, 1797, to St. John's College, Cambridge, which he entered as a student, till January, 1791, when he quitted Cambridge altogether, having taken his B.A. degree. His recollections of his Alma Mater were by no means affectionate or reverential. He says:—

"I did not love, judging not till perhaps, the timid courses of a dental student, who has been educated To see the river flow with ample range and flowless pace"

and, in particular, he was repelled by the mechanical manner in which recitations and exercises were gone through. "Intellectually," says his nephew and biographer, "he and the university were not in full sympathy with each other. He had never been subject to restraint; his school-
days were days of freedom; and, latterly, since the death of his parents, he was almost entirely his own master. In addition to this, his natural temperament was eager, impetuous, and impatient of control. At college, however, he read and thought much; he studied Italian; and he began to look on himself as a natural poet. He was ambitious to gratify his passion for the open air and for scenes of natural beauty and grandeur; and one of these tours, made in the autumn of 1790, with a fellow-collegian, was a pedes-
trian one through France and Switzerland, at the very time when the revolution was beginning in France. In 1791, after taking his degree, he spent some time in Lon-
don, and made a pedestrian tour in North Wales; and in the autumn of that year he went over to France, where he spent fifteen months in all, partly in Paris, partly in Orleans, and partly as a member of the French National Assembly. The king was dethroned when I was at Blois: and the mas-
sacres of September took place when I was at Orleans." Worsdworth was no mere indifferent spectator of the scenes of the Revolution. At this time of his life he was a vehem-
ent republican and an ardent partisan of revolutionary France against all the rest of the world. He had friends too-
among the revolutionists of the Girondist party, and so fully did he share their enthusiasm that he even entertained the intention of leaving England and joining a naturalized party, involving himself, heart and soul, into the struggle for liberty—believing that what it chiefly wanted to ensure a glorious success was the activity of a few steady, virtuous, and lofty minds, such as he was conscious of possessing. Of this he was informed by London theatre notices, and by letters which he had written, from his power. Had he carried out his intention, the probability, as he himself says, is that he would have been one of Robes-
pierre's victims, and have died on the scaffold with some of his Girondist friends. Circumstances however fortunately obliged him to remain in the island, and to return to England in a little before the execution of the king. He took up his abode for the time in London; but his thoughts were still on the other side of the Channel, and he followed the farther course of the Revolution with intense interest, complicated by the political passions and distrusts which had engendered in an unjust enterprise. Much of the influence of this time, though greatly modified, remained with Words-
worth throughout his life.

From 1798 to 1796, Wordsworth lived in a desolate
liar facts and teachings into his poetry. Hence a greater fitness in the name 'Lake Poets' than was intended by those who invented it.

Wordsworth appeared professedly not only as a new poet, but also as the representative and champion of a new theory of poetry. In the volumes he had published up to this time he had not only exemplified his principles of composition in the poems themselves, but he had also propounded and illustrated them in a series of precursors or pre-expositions and dissertations. He believed, with Coleridge, that the period in the history of English Literature intervening between Milton's age and his own had been, with a few exceptions, a kind of interregnum in English poetry—a period during which the lyrical and descriptive poet was too frequently passionate and affective as to themes and as to style; and what he claimed for himself and for those who were associated with him, was the merit of reviving the true notion and art of poetry. The following summary has been given of his views:

—Poetry, as writing to Wordsworth, takes its origin from emotion re-collected in tranquillity; what the poet chiefly does, or ought to do, is to represent out of real life, scenes and passions of an affecting or exciting character. Now, men originally placed in such scenes or animated by such passions use a nervous and a tense; and, as, also, very few of the former, except nature herself; and the poet therefore in imitating such scenes and passions, will recall them more vividly in proportion as he can succeed in employing the same language. Only one consideration should operate to make him modify this principle, and that is, the nature of his business, as a poet to give pleasure. All such words or expressions therefore as though natural in the original transaction of a passionate scene, would be unpleasant or disgusting in the poetic representation; and with these in accordance with this negative rule, any description of a moving occurrence, whether in prose or verse, would be true poetry. But to secure still more perfectly their great end of giving pleasure, while they excite emotion, poets use the natural and as little affected as possible, which had become a kind of property of the poetic corporation or guild, and which, though originally they might have arisen from genuine observation of nature, had by incessant repetition and attrition become mere lying artificial diction at all resembling the language of real men and women under any circumstances, counting it rather the essence of their craft to use a certain conventional phraseology, the so-called poetic diction, in which words were distrusted out of their natural order, and the distortion regarded as metrical art.

These views naturally provoked opposition, as similar views had already done when urged by Bowles; and Wordsworth's reply was not a very simple, or neglected or severely criticised. In the interest of his views he had selected, for many of his pieces, very simple subjects, and had written a Language as close as possible to that of real life; and these pieces were fastened on by the adverse critics and held up to ridicule as childish, grotesque, &c. Thus began the great literary controversy as to Wordsworth's poetry—a controversy which lasted almost to the end of Wordsworth's life, though by that time his triumph was, on the whole, decisive, and his admirers included the best part of the manly and thoughtful class in society; but the critical disapprobation of what he had already published, partly of the appearance of other poets, thrown out at intervals from his retreat among the Lakes, each making a national sensation and some revealing the poet's voice, gave occasion to many of Wordsworth's friends and admirers to harass most on the critics of the old school. In 1813 he took up his residence at Rydal Mount, not far from his former habitations; and here he remained till his death, allowing for occasional visits—his last tour in 1814, of a more continental tour in 1830, a tour in Holland and Belgium in 1832, in North Wales in 1834, on the Rhine in 1838, in Ireland in 1839, in Scotland again in 1833, in Italy in 1837, &c. Before his removal to Rydal Mount, his children Catharine and Dorothy Wordsworth were the two girls who were his inanimate. His poems were as yet no source of income to him; but just at the time of his removal to Rydal Mount, he was appointed, through Lord Lonsdale's influence, to the directorship of stamps for the county of Westmoreland, a post which, with light duties and the advantage of permitting him to pass a great deal of time in the main in the enjoyment of his affections, afforded him abundant health. In 1814 he published a new and great poem of 'The Excursion.' It had little commercial success and drew down the criticisms upon him more than before, including Jeffrey's famous verdict "this will never do, it will never do, it is worse than before."

In 1816 it seemed as if his great enterprise in the world of literature was about to lose its last glimmer of life, as it was called in the language of the present time, 'the author of the late Poems, appears to have deserted the world forever.' But the world recognized its mistake, and while Wordsworth's name was recognized as one of the greatest poets in the English language. It was followed by 'The White Doe of Rhyllstone'; this in 1819: 'Peter Bell,' dedicated to Southey, and which, though not very successful, fitted very finely into the poetic scheme which was more immediately popular; this, very shortly, by 'The Waggoner,' dedicated to Charles Lamb, and 'Sonnets on the River Duddon.' The poems had, most of them, been in manuscript long before they were published. In 1828 (by which time there had been new stanzas in favour of the poems) a new and most important poem, in subsequent editions; and in 1835, he published and dedicated to Rogers 'Yarrow Revisited, and other Poems,' the result chiefly of his recent Scottish tour. Other collections of poems in the same vein, either before or after 1828, were repeatedly penned and subsequently published; and in 1847 he published a collected edition of his poems in six volumes, re-arranging them in a new order on a peculiarity of his own, and with the whole as to the true nature of poetic subjects, and the true nature of poetic diction, Wordsworth was very severe in his criticism of the poets of the 18th century. Very few of them, he said, had looked at nature for themselves, satisfied with repeating the verse and over again images in any a new, which had become a kind of property of the poetic corporation or guild, and which, though originally they might have arisen from genuine observation of nature, had by incessant repetition and attrition become mere lying artificial diction at all resembling the language of real men and women under any circumstances, counting it rather the essence of their craft to use a certain conventional phraseology, the so-called poetic diction, in which words were distrusted out of their natural order, and the distortion regarded as metrical art.

These views naturally provoked opposition, as similar views had already done when urged by Bowles; and Wordsworth's reply was not very simple, or neglected or severely criticised. In the interest of his views he had selected, for many of his pieces, very simple subjects, and had written a Language as close as possible to that of real life; and these pieces were fastened on by the adverse critics and held up to ridicule as childish, grotesque, &c. Thus began the great literary controversy as to Wordsworth's poetry—a controversy which lasted almost to the end of Wordsworth's life, though by that time his triumph was, on the whole, decisive, and his admirers included the best part of the manly and thoughtful class in society; but the critical disapprobation of what he had already published, partly of the appearance of other poets, thrown out at intervals from his retreat among the Lakes, each making a national sensation and some revealing the poet's voice, gave occasion to many of Wordsworth's friends and admirers to harass most on the critics of the old school. In 1813 he took up his residence at Rydal Mount, not far from his former habitations; and here he remained till his death, allowing for occasional visits—his last tour in 1814, of a more continental tour in 1830, a tour in Holland and Belgium in 1832, in North Wales in 1834, on the Rhine in 1838, in Ireland in 1839, in Scotland again in 1833, in Italy in 1837, &c. Before his removal to Rydal Mount, his children Catharine and Dorothy Wordsworth were the two girls who were his inanimate. His poems were as yet no source of income to him; but just at the time of his removal to Rydal Mount, he was
and brother of Princess Dashkow. Semen Woronzow was for many years Russian ambassador to England, where he was first sent by the influence of Prince Potemkin, in 1760, and where he remained in that capacity till 1766, when, retiring from the service, on account of ill-health, he obtained permission from his government to remain in England, and resided in London as a private gentleman till his death in 1822, at the age of eighty-nine. His son, the Earl of Pembroke, married the late Earl of Pembroke, and was mother of the Right Hon. Sidney Herbert. Mikhail Woronzow, living in England to the age of sixteen, was as familiar with the English language and manners as many of his contemporaries with the French. He was born in the country, and the country of his education certainly had no cause to blush for its pupil. At the age of nineteen he entered the Russian army, in which he fought under Kutuzov against the Turkish, and took part in all the great campaigns against Napoleon I. He commanded a division at the battle of Borodino, where he was severely wounded, and he led the Russian cavalry at the battle of Leipzig. It is said that on a subsequent occasion, in 1814, his conduct was elicited from Napoléon himself: "That is the stuff of which marshals are made." Several interesting notices of his opinions and conversation at the time of the occupation of Paris by the allies after Waterloo, are to be found in the diaries of his friend, Sir John Malcolm, printed in the "Memoirs of a Life," and these show that he was indeed the Russian contingent in France from 1816 to 1818, and is said to have paid an enormous sum from his private purse to avoid the disgrace of leaving the debts of Russian officers unpaid when they evacuated the country. In 1822, after his retirement from the service and residence in London, he returned to Russia and Bessarabia, a post which he held for many years, only quitting it for a short time in 1828, to take the command of the Russian army after Menshikow had been wounded at the siege of Silistria. This division was added in 1844, that of the Caucasian Provinces, with an authority superior to that of any preceding governor, Woronzow being made dependent on the Czar alone. He adopted as far as possible a policy of conciliation to the native tribes, which impressed Charles Townshend, the British minister, as to capture in 1845 the stronghold of Shamy, the town of Dargo. The bravery and obstinacy of the mountain people rendered his military successes in Circassia of no permanent value, but he succeeded in introducing great improvements into the other countries under his government, building towns, making roads, promoting the cultivation of the vine, and settling in general an example of disinterestedness and high feeling. He always continued partial to the land of his youth, where he was fond of receiving Englishmen, and his countrymen—indeed, the whole of his country after the imperial residence of Orianda, was built from the designs of an English architect, Mr. Papworth. He is understood to have been averse to the Russian war with England. During his time in France on the Turkish question, in which, by a somewhat similar combination of circumstances, his nephew was the English secretary at war. During the early progress of it he was kept by ill-health at Tiflis, and in March 1854 he obtained a six-months' leave of absence, which he spent at Karalad and Schlangenbad, but with so little benefit, that in October of the same year he solicited and obtained permission to retire. He died on November 18th 1856 at Odessa, leaving behind him a high reputation among both natives and foreigners for probity and independence.

WYATT, RICHARD J. An eminent sculptor, was born in Oxford-street, London, on the 3rd of May 1770. Having chosen sculpture as his profession, he was placed as a pupil with Charles Rossi, R.A.; and about the same time he entered the Royal Academy as a student. During the seven years which he served with Rossi, he twice carried off medals at the Academy, the first time in the studio of Nacar, where his Augustan figure of Bocio at Paris, and who kindly invited him to Rome, and offered him advice and assistance in the prosecution of his studies. In the fall of Caravaggio he was a fellow-student, and the friendship here formed between the young students, who were ultimately to rank together as the first English sculptors in Rome, remained unbroken through life. With Canova Wyatt likewise retained the warmest friendship, till the death of the great Italian master. Wyatt went to Rome in 1819, and he made that city his permanent abode, only once making a brief visit to his native country in 1841. He died suddenly at Rome on the 29th of May 1850. Wyatt was a man of singularly gentle unassuming temper, and quiet retiring habits. His whole life was spent in the diligent prosecution of his profession—at which he laboured often from dawn till near midnight. The number of his productions is enormous; and not only are they of the highest merit. He was greatest in poetic and classic subjects, in which he displayed a fertility and grace of invention, a singular elegance of thought, and a degree of finish beyond most of his contemporaries. He was undoubtedly one of the noblest of the sculptors of our time. His busts of Barba and specially his female figures, are beautifully modelled, always posed with grace and animation, and always present pleasing forms from whatever side they are viewed. His figures too are live to all who see them; he expresses textures truly, yet without lack of sculpture or plasticity. As examples of his style may be mentioned his statues of "A Nymph entering the Bath"—one of his most beautiful of his many versions of which, that was executed for Lord Charles Townshend, was called "Nymph leaving the Bath"—herd with a Kid; 'Shepherd Boy; 'Glycera; 'Musidore; 'Bacchus; 'Penelope,—an exquisite statue executed for her Majesty; and his admirable groups of the "Nymph Euchaeras and Cupid; "Iaso and Bacchus; "Nymph of Diana taking a thorn from a greyhound's foot; "A Huntress with a Leveret and Greyhound"—his last work. He also produced many excellent portrait busts, some relié, and monumental sculpture. At the Great Exhibition of 1851, several of his works were exhibited, and the medal for sculpture was awarded to him. He was a member of the Royal Academy, a bye-law of that institution rendering artists ineligible unless resident in England. Casts from several of Wyatt's works— including most of those named above—are kept in the Crystal Palace at Sydenham. WYCH-ELM. [Uxbridge.] WYON, WILLIAM, an engraver and designer of medals and coins, was born at Birmingham in 1795. The pursuits and associations of his family (of German descent) were peculiarly calculated to give direction to his mind and to foster whatever natural abilities he possessed. His grandfather, George Wyon, engraved the silver cup embossed with a design of the assassination of Julius Cæsar, which was presented by the city of London to Wilkes. His father, Peter Wyon, to whom, in 1768, he was apprenticed, was a dealer of reputation at Birmingham, and with him was associated William's uncle, Thomas, as partner, to whom young Wyon was much indebted. The earliest of his productions of which we find any marked notice were copies of the heads of Hercules and of the Venus of Milo, which were modelled at the Society of Arts, and was purchased by it for distribution as an agricultural prize. A second gold medal from the same body marked the appearance of Wyon's group— Victory drawn by Tritons. As there is a figure of Antinous, which so delighted his father, that he had it set in gold, and wore it constantly until his death. Wyon came to London in 1816, and won his way through a competition to the post of second engraver at the Mint. In 1820, he married Thomas Wyon, a woman of the highest character. After some time he cut the head of George III. His prospects were now most favourable, and his position altogether agreeable to him—for the chief engraver, Thomas Wyon, was his friend and cousin.
But unexpectedly the latter died, and Mr. Pistrucchi was nominated in his place. The new engraver and his chief assistant could not agree. Pistrucchi, a skilful artist, is said to have been indolent, and while serving to himself the greatest part of the honour and emolument, to have left the greater amount of labour to Wynn. Under a new Master of the Mint these differences were compromised by an arrangement, which left Pistrucchi nominally chief engraver until his death, but gave half his salary to Wynn. With this Wynn no longer on the literary wars that arose out of these occurrences, further than to observe that the younger man found an enthusiastic champion who issued a memoir of his life, and a list of his works, then exceeding two hundred in number. The Royal Academy marked its opinion of this controversy, and of Wynn's own merits, by electing him in 1833, an Associate, and in 1836 an Academician, the first of his department who had ever obtained these honours.

Wynn's works may be divided into coins and pattern pieces of coins, medals, and seals. His coins include some of the later years of the reign of George IV., all those of William IV., and all those of his present Majesty which appeared in Wynn's lifetime. He followed Chantrey's models in the coins of both the kings, but was his own designer in the coins of Victoria. The pattern pieces include one of ten pounds for William IV., and one of five pounds (among several others) for the present Queen, which bore a figure of Una on the reverse. These pattern pieces did not become coins through the artist who struck them at this time, under the title of moneyers, were the privileged coiners of the country, and who knowing that increased expense would be necessary, took care of their profits, and did not trouble themselves about Wynn's disappointment or the intentions of his countrymen. In consequence of this neglect, many of these pieces, and were produced for many different and admirable objects. There are war medals for the Peninsular victories, for Trafalgar, for Jellalabad and Cabul; scientific medals for the Royal Society, Royal and London Institutions, Geological, Geographical, and similar societies, native and foreign artistic medals, as for the Royal Academy and Art Union educational, as for Harrow, a gift by Sir Robert Peel; and testimonial, as in the case of the Bromley medal, which bore a head of the queen, whose honour it was in the accompanying circumstances. Thus, Cicerò adorned the Peel-Harrow medal, while heads of Lord Bacon, Sir Isaac Newton, Dr. Wollaston, and Sir Francis Chantrey, were respectively and appropriately connected with the medals of the Royal Institute, the University of Glasgow, the Geological Society, and the Art Union. Many—and among them some of the best—of the reverses were from his own designs; while for others Wynn was indebted to Flaxman, for whom he had an enthusiastic veneration, Howard, and Stothard, who contributed the reverse to a medal of Sir Walter Scott. Wynn's increasing eminence was shown in the various commissions he received from foreign countries; we may especially mention his engagement for a series of Portuguese coins.

The characteristics of Wynn are the combination of two (often opposing) qualities, strength and delicacy, with the indispensable merit of likeness in his portraitures; taken for all in all, we have had no such medal engraver since the days of Simon, the artist who shed so much lustre on this department. Wynn was born at Brighton, October 29, 1851, in his fifty-seventh year, leaving a son, Leonard, who, having aided him in his lifetime, inherited much of his skill at his death. To the latter we owe the well-known medal of Wordsworth; and his name is connected with frequent contributions to the Royal Institute's Great Exhibition; and is thus gratefully associated in art as in blood with the subject of our present notice, whose latest works were in commemoration of that same assemblage of the world's industrial and artistic fruits.

YARRELL, WILLIAM, a celebrated British naturalist, was born in Duke-street, St. James's, Westminster, in June, 1784. His father was a newspaper agent, and to his business his son succeeded, and continued in it till nearly the close of his life. When young he was fond of field-sports, and was not only the first shot, but the first angler of his day. The accurate habit indicated by his superiority in these sports, was the prevailing character of his mind. He was not only the first shot in London, but for many years the first sporting authority upon all that belonged to the interesting subject of ornithology and British birds. He was the same with fish. Not satisfied with obtaining his prey, he examined it, preserved it, and described it, and thus became a naturalist. At the age of forty he became a Fellow of the Linnean Society; and from this time he gave up the gun and rod for the pen. From 1825 to the year of his death, 1856, he became a constant contributor to the Transactions of the Linnean Society, and the various Journals devoted to natural history literature. His earlier papers were devoted to birds, as the following titles of some of his first scientific contributions show:—'On the Change in the Plumage of some Hen-Pheasants' ('Philosophical Transactions,' 117); 'On the Occurrence of some rare British Birds' ('Zool. Journal, II.); 'On the shall hornied appendage to the upper mandible in very young chickens' (Ibid.); 'On the Anatomy of Birds of Prey' ('Zool. Journal, III.); 'On the Structure of the Beak and its Muscles in the Crossbill' (Ibid., IV.). He was one of the most intimate members of the society, and contributed many papers to the Proceedings of the Committee of that body. In the first volume of papers published by the Society, Mr. Yarrell contributed no less than seventeen. They exhibit a wide and accurate knowledge of the forms not only of birds but of fishes and mammals. In these papers his dissections are very numerous, and they are very accurate. This is the more remarkable, as Mr. Yarrell had not the benefit of a medical education nor any further means of instruction than those supplied by his own industry. It was in these earlier papers that he demonstrated the true nature of White Bait, and showed that this pet morsel of the London epicure is a true species of fish, and not the young of the Shad, the Herring, or any other species of fish, as had been supposed up to his day. He had a particular love for the study of zoology, many of his papers being devoted to foreign animals, as the following:—'On the Anatomy of the Lesser American Flying Squirrel'; 'On the Woolly and Hairy Penguins of Dr. Latham'; 'On the Trochæa of the Cuculliferae'; 'On the Natural History of the Great White Shark'; 'On the Natural History of the peculiar Birds of the California Islands.' In 1843 he wrote a paper on the natural history of the Great White Shark, which, he said, had been killed by the fishermen of his native port of Lowestoft, and on the same day that it appeared in the society's journal, it was declared it had been killed by the great shark which previously to this appeared at the same place. Yarrell's papers on British fishes appeared in two vols. 8vo, in 1836. It contained original descriptions, with an account of the habits, and a wood-engraving of every British fish. It was in every respect an admirable work, containing accounts of several new fishes, with such descriptions as enabled the naturalist to distinguish them, whilst they were rendered by the agreeable style in which they were written attractive to the dullest of anglers. A second edition appeared, but a third was not forthcoming. The 'History of British Birds' appeared in 1843. It was on the same plan as that of the fishes. The illustrations in wood were accurate and beautiful, and highly creditable to the enterprise and taste of its publisher Mr. Van Voorst. No work on this subject since the time of Bewick's 'Birds' has been so popular. In many of his details, especially his picturesque tail-pieces, he imitated his great predecessor, but in point of accuracy of description and the homely
YEA

truthfulness of his account of the habits of birds Mr. Mr. Yarrell had no equal. At the time of his death Mr. Yarrell was treasurer of the Linnaean Society, and had been elected vice-president during the presidency of Robert Brown. Although one of his earliest papers was published in the ‘Philosophical Transactions,’ Mr. Yarrell was never a Fellow of the Linnean Society, and when he died, no one, except his late wife, knew of his death. During the greater part of his life, the Royal Society would have gladly admitted him amongst its fellows, and his certificate was presented to him. In August 1856 he was attacked with paralysis, but although he sufficiently recovered to make a voyage to Yarmouth, he was seized with another fit on the evening of his arrival, and died on the morning of the first of September 1856. He was interred at Bayford in Hertfordshire.

YEAST, a substance found on the surface of fermenting liquids, and when removed capable of producing fermentation in other liquids susceptible of this action. On placing yeast under the microscope it presents a number of cells immersed in a mass of amorphous matter. The cells are sometimes single, and at other times several are united together in a kind of chain. These cells are supposed to partake of a fungous character, and they have been called the yeasts. Yeasts have large vacuoles, and these vacuoles have been constituted for the reception of this organism, under the name of Saccharomyces cerevisiae.

This plant has been supposed to be the active cause of fermentation, and that the other saccharomyces degrees are probably a pseudomorph of this process, being regarded as the result of the growth of the plant. This seems to be a misinterpretation of the phenomena, as the plant is probably the result of the carbo-nic acid given off during the process of fermentation rather than from the fermentation. Yeast-ferment cells originate in liquids, independently of other cells, and are truly instances of the formation of cells in a free fluid. He observes, however, that they have no power of reproducing other cells. The whole subject of the nature of yeast has been enlivened by the discoveries of double organisms in their development, as well as the phenomena of fermentation in general, requires further elucidation.

(Schleiden, Principles of Scientific Botany; Microscopic Dictionary, articles 'Fermentation,' 'Torula,' 'Yeast.')

YELLOW COPPER ORE. [MINERALOGY, S. J.]

YOUNG, THOMAS, M.D., was born June 13, 1773, at Milverton, in Somersetshire. He was the eldest of ten children of Thomas and Sarah Young, who were both Quakers. In 1780 he was placed at a boarding-school at Stapleford, near Bristol, and in 1782 was sent to the school of Mr. Thompson, at Compton in Dorsetshire, where he remained nearly four years. During this period he studied, besides the classical languages, Oriental languages, and the modern languages. After his return home he devoted himself almost entirely to the study of Hebrew, and to the practice of turning and telescope-making, which he had been taught by an usher at Compton school. In 1787 he accepted, in conjunction with Mr. Hodgkin, an engagement as private tutor to Hudson Gurney, grandson of Mr. David Barclay, of Youngsburry, near Ware, in Hertfordshire. There he remained till 1792, devoting his leisure hours to the prosecution of his studies in Greek, Latin, and modern languages, Oriental languages, algebra, fluxions, natural philosophy, and the 'Principia' and 'Optics' of Newton. Mr. Hodgkin in 1793 published 'Calligraphy Graeca,' which he dedicated to Young, who had suggested to him the study of that useful art. In 1794 he published 'A Course of Lectures on Natural Philosophy and Mechanism,' which was most advantageously received, and other memoirs, and a classified catalogue of scientific publications. A new edition was published in 1845, 'with References and Notes, by the Rev. P. Kelland, M.A., F.R.S., &c., illustrated by numerous Engravings on Copper,' 5vo. These lectures embody a complete system of natural and mechanical philosophy, drawn from original sources; and are distinguished not only by extent of learning and accuracy of statement, but by the beauty and originality of the theoretical and practical parts. One of these is the principle of interferences in the undulatory theory of light. 'This discovery alone,' says Sir John Herschel, 'would have sufficed to have placed its author in the highest rank of scientific immortality, even were his other almost innumerable able claims on such a dignified and important recognition, however, of Dr. Young's investigations on light was very unfavourable. The novel theory of undulation especially was attacked in the 'Edinburgh Review,' and Dr. Young wrote a pamphlet in reply, of which only one manuscript copy was extant. This question was treated in the French philosopher Fresnel, who entertained views similar to his own on the nature of light. The undulatory theory is now generally received in place of the molecular or eamatory theory. Among the other difficult matters of investigation in which Dr. Young engaged was the decipherment of the Egyptian Hieroglyphics, in which he was superiorly equipped.
of the physicians of St. George's Hospital, a situation which he retained for the remainder of his life. His practice there was not very successful, but he never became popular. In 1813 he published 'An Introduction to Medical Literature, including a System of Practical Nosology, intended as a Guide to Students and an Assistant to Practitioners,' 8vo. In 1816 Dr. Young was appointed secretary to a commission for ascertaining the lengthening of the seconds' pendulum, for comparing the French and English standards with each other, and for establishing in the British empire a more uniform system of weights and measures. Early in 1817, reports, 1819, 1820, 1821. In 1818 Dr. Young was appointed secretary to the Board of Longitude, and on the dissolution of that body he became sole conductor of the 'Nautical Almanac.'

Dr. Young at successive times contributed eighteen articles to the 'Quarterly Review,' of which nine were on scientific subjects—the rest on medicine, languages, and criticism. Between 1816 and 1823 he wrote sixty-three articles for the 'Supplement to the Encyclopædia Britannica,' of which forty-six were biographical. In 1821 he made a short tour in Italy in company with his wife. In August 1827 he returned to England, in June 1828, became a member of the Academy of Sciences at Paris, in place of Volta, who died in 1826. Dr. Young died May 10, 1829, and was buried in the vault of his wife's family at Farnborough, Kent.

In 1835 was published 'The Life of Thomas Young, M.D., F.R.S., &c. by George Peacock, D.D., F.R.S., &c., Dean of Ely, 8vo.' In the same year was published 'Miscellaneous Works of the late Thomas Young, M.D., F.R.S., &c., vol. 1. and 2. containing his Miscellaneous Memoirs and Correspondence,' 8vo, &c., edited by John Leitch. These volumes contain all Dr. Young's contributions to the 'Transactions' of the Royal Society; the principal articles furnished for the 'Quarterly Review,' an essay from Nicholson's 'Journal' and Brande's 'Journal,' some reviews on scientific subjects from the 'Quarterly Review,' and several essays either separately published or dispersed in different publications.

ZAGOSKIN, MIKHAIL NIKOLAEVICH, a Russian dramatist and novelist, was descended from a Tartar family, and was born on the 14th of July (o.s.) 1789, at the village of Ramaz, in the government of Penza. He remained in his native village till the age of fourteen, receiving but a slender education, and learning no language but Russian, but was early reared up to the study of his literary tastes, reading all he could obtain, and composing a tale at the age of eleven. At fourteen he was sent to St. Petersburg as a clerk in a government office, and continued in that kind of employment till the outbreak of the war of 1812, when he became an officer in the St. Petersburg Opoljenie or Militia, took part in the campaign against the French, was wounded at the battle of Poltzak, and before the close of the war rose to beadjutant to General Lewis at the siege of Danzig. By this time he had acquired some knowledge of French and German, his long dormant literary tastes reviving, and not long after he had taken leave of a military life—he sent anonymously a comedy, called 'Prokaznik' or 'The Wag,' to Prince Shakhovsky [Shakhovskoy, S. 2], director of the St. Petersburg theatre, who had himself just returned from the duties of a regiment of Cossacks. The reply was so unexpectedly favourable, that Zagoskin at once made himself known, and Shakhovsky even procured for him a post connected with the theatre, and opened for him a literary library, where we are told that for his services in assisting to arrange the books and to catalogue the Russian ones, he received the Order of St. Anne of the third class. This was the commencement of his career as a dramatist, which he pursued first at St. Petersburg, and after 1820 at Moscow, to which city he was transferred as director of the theatre. He wrote altogether seventeen original comedies, some in verse and some in prose, several of which met with distinguished success, and none failed except the last. The best of them was 'Mr. Geronimo,' or the Country Gentleman in the Metropolis;' 'Bojetonov the Second, or the Metropolitan in the Country;' 'A Romance on the Highroad,' and 'The Journey Abroad.' It is worthy of remark that till beyond his thirtieth year Zagoskin had not written a line of verse, his ear being singularly insensible to cadence and metre, and that in 1821, on some of his friends laughing at him for pretending to give his opinion on poetry when he laboured under this deficiency, he was piqued into saying that he would give them an example; and after all, setting doggedly to work, and making progress at the rate of four lines a day, correcting the metre on his fingers, he produced some verses that were not only rhythmically correct, but remarkable for their grace and freedom. After this he frequently wrote in verse, but detested the composition; and when he determined to write a drama in imitation of Walter Scott, one chief inducement was to enjoy a double freedom from the trammels of rhyme and

Z

the rules of the drama. The tale he produced, 'Yuri Milolavsky ili Rusci v 1612 Godu' [George Milolavsky, or the Russians in 1612], 3 vols., Moscow, 1829, delineates the state of Russia at the time that it was nearly conquered by the Poles. The success it met with was prodigious. "The appearance of this romance," says Zagoskin in his biography, "opened a new epoch in the literature and social career of Zagoskin. The enthusiasm was universal and unanimous; few indeed were there who did not fully share it. The public of both the capitals, and after them, or rather with them, the public of all the provincial towns, were all taken into a rapturous迷狂的 comments; the 'Yuri Milolavsky' is read by all Russia that can read, and not without cause; the Russian mind and soul, and even the Russian way of speaking, were for the first time represented in Russia in this romance." An English translation of it appeared in London, in 1854, under the title of 'The Young Muscovite, or the Poles in Russia, edited by Captain Frederic Chamier, R.N.,' and was said in the preface to be 'edited' from a manuscript translation of the book made in 1820 by a Russian lady of high rank and her two amiable daughters," to which the editors, for it appears that there were more than one, took the liberty of adding "an underplot by which the characters of the chief actors are further developed. Although of course these alterations were not approved by the Impeators, their aim was, in their Russian life and character, stamped by native approbation as correct, they are not so extensive as to spoil it. Speaking of it from a full perusal of the original, we should say that 'George Milolavsky' was an amusing third-rate tale, rather unequal in its progress, and falling off sadly toward the end. Zagoskin was hailed as the Russian Walter Scott. For his next tale 'Rostavlev,' a story of Russia in 1812, in which he introduced some of his own adventures, there was an unheard-of competition in the Russian publishing world, as 500 copies were printed, and an enormous price given for the copyright, but it was far from attaining the success of its predecessor. Zagoskin went on writing novels and romances, and in general founding a play on each after it appeared; but the merit and popularity of his works went diminishing, and some of his best were considered to rival 'Yuri Milolavsky,' or even 'Rostavlev.' He continued to reside at Moscow, where he enjoyed the additional appointment of director of the library of the Kroukhevi, and was one of the most known and popular member of the best society, which his never failing good humour and disposition to merriment qualified him both to enliven and to enjoy. Almost his only work besides his plays and novels was a collection of essays entitled 'Moskva i Moskvichi' [Moscow and the Moscowians], which ran to three or four volumes. After a tedious illness, originating in gout, which he combated by homoeopathy, he suddenly expired at Moscow on the 23rd of June (o.s.)
1882. Soon after his death a life of him by Aksakov appeared in the 'Moskvitianin,' from which the following particulars have chiefly been taken. His best works have an interest both to the native and foreigner from the purely Russian tone of their language and spirit, as indeed in everything he did. His military experiences and the perilous undertakings during the war which terminated in 1815; acquiring the character of being one of the most able and accomplished officers of the Danish navy. At the general peace he betook himself entirely to geodetical and hydrographic and administrative affairs. Professor Schumacher in the measurement of the Danes are of the meridian. After a cruise to the West Indies, during which he made a chart of a portion of their seas, and set up an observatory on the island of St. Thomas, he was appointed successive Admiral Lovenørn as director of the Hydrographic Office at Copenhagen. In this capacity, notwithstanding much prejudice respecting the publication of documents, he brought the labours of his department in an available manner to the world, and with the highest degree of finish and exactness. The works so important to the navigators of all nations, on which his fame rests, are the charts of the coast of Denmark, with accurate soundings between the numerous islands, accompanying charts on the coast of the islands and the principal metrical surveys of the coast. His chart of the North Sea (1843) was indeed the greatest boon to all seamen, and to those of Britain in particular; whilst the 'Danake Lode' (Danish Pilot), which is a complete description of all the seas around Denmark, is best in its kind so far as known, has been translated, under the direction of Admiral Sir Francis Beaufort, F.R.S., late hydrographer to the British Admiralty, into both the English and French languages. He was also master-general of the naval ordnance of Denmark, chief of the steamers, head of the coast and Copenhagen, and a chamberlain of his sovereign, as well as a knight grand-croix of the order of Dannebrog and Dannebrogman, and a knight of four foreign orders, Russian, Prussian, French, and Greek.

A diploma Sahmsenes died suddenly on the 15th of April, 1853, in the sixtieth year of his age. The estimation in which he was held by his countrymen was evinced by the attendance at his funeral of the princes of the royal family, the ministers of state, the corps diplomatic, and many officers of the army, navy, and civil administration.

He was an honorary member of the Royal Geographical Society of London, and communicated to that Society, in 1830, shortly after its foundation, an account of Danish discoveries and expeditions in the Eastern seas, in which he had been engaged in the service of his country. This year: a translation of his official report on which, sent to the Geographical Society of Paris, appears in the first volume of the Journal of the former Society. In the same work, vol. v., is an elaborate paper by him entitled 'Remarks on the Voyages to the Northern Hemisphere, ascribed to the Zeni of Venice;' in which, communicated to the society in 1836, he arrives at the conclusion that these voyages, at least in the main points, are mere fabrications.

Z. A. H. 781
ZEA

1849. The New Zealand Mail steamer, the 'Leven,' after a voyage of 10,000 miles, arrived at the port of Wellington on the 18th of February, having arrived from Sydney on the 15th of February. The New Zealander, the New Ulster, is generally called North Island. The native name of the other large island is Te Waki Pounamu, 'The Place of Pounamu,' that is, of jade, used by the natives in forming pieces of the natives. This island is generally called New Zealand. The name New Ulster, but is generally called Middle Island. The small island has been named New Leinster, but is mostly called South Island, or Stewart Island. The islands lie between 34° 25' and 47° 20' S. lat., 166° and 178° 36' E. long. The two large islands are about 3,000 miles, and the entire length of the two is about 1,000 miles. The width varies from a few miles to 250 miles. Stewart Island is about 60 miles in length and 60 miles in width. They are about 1,200 miles eastward from the New Zealander, the New Ulster, the New Zealand Mail steamer, the 'Leven,' after a voyage of 10,000 miles, arrived at the port of Wellington on the 18th of February, having arrived from Sydney on the 15th of February. The New Zealander, the New Ulster, is generally called North Island. human houses. The towns in the house are mostly of wood. The town of ZEA is a part of the island where the soil is especially fertile, and it has an easy communication with all the countries both to the north and to the south. Many of the English, who settled on the island before the foundation of the colony, reside in the harbors north of Auckland, and a great number of small coasting- vessels visit Auckland. Around Auckland are four pensioner-villages for discharged soldiers. Auckland was incorporated as a borough on July 29th, 1851, the district by which it is formed extending 16 miles in length and 9 miles in breadth. In 1851 there were 14 wards, of which three are in the town itself. The Tamaki Creek intersects the borough, is navigable for boats, and is made available for the commerce of the district. The borough is governed by a mayor, aldermen, and town councillors. The town and its environs were St. Paul's church, a handsome building; two sets of barracks built of siorie; a public hospital; a market-house; a native hostelry; public washing, bathing, and drying grounds; several chapels; and a bank. There also several bridges, wharves, and landing-places. The governor's residence and the bishop's are closely adjacent, and four miles from the town, on the banks of the Tamaki, is St. John's College. There is a church at each of the pensioner- villages. The population of the town in 1861 was about 4000; in the district in 1861 there were 8840, of whom 4921 were males, and 3919 females. The flag-staff of the barracks is 31' 51" 27' 8". The Wellington, the principal settlement of the New Zealand Company, founded in 1840, is on the shores of Port Nicholson, in the island of New Ulster, but for governmental purposes the town and the whole of the district are comprised in the province of New Munster. Port Nicholson lies in 41° 47' 27' E. and 174° 47' 7" S. The town is surrounded by mountains, except at the alluvial tract through which the river Hutt, or Erington, reaches the sea. These mountains rise abruptly from the water's edge, except in the most southern corner of the harbour, where there is a strip of flat land extends at their base, about one-third of a mile broad and two miles long, the soil of which is composed of sand, shells, shingle, and vegetable earth. On this flat ground, which surrounds that portion of Port Nicholson called Lambton Harbour, the town of Wellington has been built. It extends about three miles in the form of a semi-circle round the harbour. The flat ground not being considered sufficient for the town, the hills south of it were included. As these hills are generally too steep to build on, they have been planted partly for wood, and partly for pasture, and thus the most distant points of the town are nearly four miles from the harbour. In 1848 there were 525 houses, of which 45 were of brick or stone, 303 of wood, and 177 of clay and wood, or other materials. Other houses are of cylindrical shape, covered with corrugated iron, since the winds of gales and jetties, which have been built so that vessels of 70 tons can unload alongside of them. There are two churches, and an Episcopal chapel, a Presbyterian chapel, a Wesleyan chapel, three other Dissenting chapels, and one Roman Catholic chapel, with a Roman Catholic bishop; there are also an hospital, a bank, a savings bank, a mechanics institute, a horticultural society, a custom-house, an exchange, a jail, two sets of barracks, and the residence of the lieutenant-governor. There are also 38 schools of various kinds. Most of the public buildings are of wood only. The population of the district in 1861 was 5727, of whom 3153 were males and 2587 females. The town is well supplied with water by streams which run north into the bay, and there are deep wells, which supply every public-house is compelled by the terms of its licence to keep burning; the streets are not paved, but excellent roads have been made in several directions along the coast to the valley of the Hutt, and towards that of Wairarapa. Two miles from the town three churches have been consecrated, and the buildings have been well conducted. In 1856, the vessels registered at Auckland, or belonging to it, consisted of 3 steamers, 41 foreign-going vessels (6918 tons total burthen), 75 coasters belonging to English owners, 49 coasters belonging to native owners, and 188 small craft averaging 10 tons, of which 34 belonged to native owners, being unnumbered. The coast in 10 to 70 feet in front of the town. Auckland, named after the famous city in Great Britain, was founded in 1840, by the French, who had attempted to land in the Bay of Islands, but were prevented by Governor Hobson; and under his direction, and accompanied by an English magistrate under the British flag, they settled at Akaroa. Akaroa is near the south-east coast of Banks Peninsula in New Munster, in 43° 62' 6".lat., 173° E. The Harbour is an inlet 7 miles in depth, with steep shores, and has a bar at the entrance, but it is perfectly landlocked within. Thelli this HARVEST, the hills are cultivated, and it, and there is 14 fathoms water inside the harbour. The town contains a church, the residence of the magistrate, a jail, and the cottages of the inhabitants, who are chiefly agriculturists. Bay of Islands, at the northern end and east coast of New Zealand, is the seat of an important whaling station, and was first settled by Governor Hobson for the site of the capital, but was abandoned in favour of Auckland. Two towns however sprung up, Russell and Kerikeri; the first on the north side, and inhabitants expelled by Hekia, and from the other they withdrew to Auckland. Still some Europeans have kept their position here, and the government returns state the population as 400. Canterbury is the name of a settlement on the bank of the Rakaia river, to the north-west of Christchurch, according to the principles of England, and with a large ecclesiastical establishment. It comprises the whole of Banks Peninsula, and a large district running back westward to the range of mountains, and extending along the eastern coast for many miles, and the population in 1850 was estimated in the government returns at 1600; but Mr. Fox, in his "Six Colonies of New Zealand" (1822), gives the number at 3374; and two towns had been formed, Lyttelton, at Port Victoria, and Christchurch, on the eastern side of Lyttelton Harbour. Christchurch College and schools founded. Kaitaia is a native village, and a missionary settlement in New Ulster, in the valley of the Awanui, a few miles S.W. from Doubtless Bay, and about 40 miles from the coast, towards the north-east of New Ulster. Motuwaka is a native village, with a slight admixture of Europeans, about 50 miles S.E. from Nelson. In this village, of which the population is about 1400, agriculturist seems to be the principal occupation. The island of Queen Charlotte Sound in Cook Strait. Nelson, situated on Nelson Harbour, in Blind Bay, New Munster, on the southern side of Cook Strait, in 41° 16' S. lat., 173° 16' W. long., was the second settlement of the New Zealand Company, and was made in 1843. The port is a good one, but the district is chiefly agricultural. The population of the whole district, which is extensive, amounted in 1851 to 4287, of whom 2317 were males, and 1970 females. There are in the town one church, one Wesleyan chapel, two other chapels for Dissenters, and one Roman Catholic chapel. There are three other churches and six chapels at various villages. We have noticed the great extent of sheep farming in this district, and as the pastures lie wide it has led the people to export wool. Three miles from the town, 18 miles, have been already formed, and a communication by land has been opened with Canterbury, a direct distance of about 170 miles, to Lyttelton. Coal exists in great abundance in the vicinity; one seam at Nelson and one at Waiaki lead to a total of 1000 tons per month. Copper is also found near the Mount Dun, about 8 miles from Nelson. In New Ulster, situated between two small streams, the Huatoki and the Henui, near their entrance into the sea, on the northern side of the peninsula of which Cape Egmont is the western termination, and in the midst of which stands
beridae. The Boar-Fish of English writers is referred by Jenyns and others to this genus, but Cuvier, Lacépède, and Yarrell, refer it to Cephalopods. The Boar-Fish is a species of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZEUS, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

Z. Eeze, a species of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZEBRA, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZEUROPA, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZERUZER, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZEBRA, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

ZERUZER, a genus of nocturnal Lepidoptera. The male antennae are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

distinction by proficiency in study, at the village of Mishenskoye, which was picturesquely situated on the banks of the Oka, he cultivated his talents for poetry, music, and drawing, for all of which he had a natural gift.

It was at a house within sight of the church and churchyard of Mishenskoye that the first translation of Gray's 'Elegy in a Country Churchyard,' the first production of his pen which made an impression on the public. Gray's 'Elegy' is at this moment the most universally known and universally popular piece of poetry in existence. Bowering, in his biography of Gray, tells us that the translation of more than one hundred and fifty different versions, and among them Zhukovsky's is undoubtedly one of the best. This fortunate translation, which was published in 1802, was, like Moscow and the Muscovite, the foundation of a fame which extended itself far beyond the limits of its creator. In 1807, it first appeared in the 'Viestnik Evropy,' or European Intelligencer, thus the leading periodical of Russia, of which Karamzin, its most popular author, was at the time the editor, and it introduced him at once to the friendship of Karamzin and Dmitriev, and a position amid the best literary society of Moscow. A few years later, in 1808 and 1809, Zhukovsky became himself the editor of the same periodical, and he soon relinquished the employment, though he continued himself a contributor there.

In the war of 1812, both Karamzin and Zhukovsky were anxious to bear arms, but the bodily infirmities of Karamzin would not allow him to sit on horseback, and Zhukovsky took leave of him at Moscow at the house of Count Rostop- chin, whose services, however, it was not intended, to his ranks of the army. As a lieutenant of the Moscow volunteers, Zhukovsky fought at the great battle of Borodino, and he took an effective part in the subsequent memorable campaign, both as a bard and a soldier. It was in the former capacity that he was most distinguished:

"Minstrel in the Russian Camp," a series of songs on the war, created unbounded enthusiasm among the soldiery, were struck off at a military printing-press, and circulated among the ranks of the army. However, he became accustomed to the fatigues of a military life, was attacked by fever, and obliged to quit the army early in 1813. The Empress mother, Maria Theodorovna, who had been delighted with his poems, was anxious to see and reward the "Minstrel in the Russian Camp." He was invited to the court, and the issue of a poetical epistle to herself, and Zhukovsky, who had been decorated with the order of St. Anne for his military services, received from the Emperor Alexander a pension for life of 4000 rubles. For some years afterwards his time was divided between Moscow at St. Petersburg.

He was of the family of imperial favour, of great success in society, and till the rise of the Russian Byron, Pushkin, of the reputation of being the first poet of Russia.

His most popular productions in this his most productive period are the poems of ballads, which he was the first to introduce into Russian literature. His first poem of the class, "Zlumilki," an imitation of Bürger's 'Lenore,' startled the Russian public into a belief that he had a talent for the poetry of romance, and he treated the same subject with variations in a poem entitled 'Svetilana,' which is still considered his masterpiece, and finally he translated "Lenore" itself simply from the German into Russian. Almost all his subsequent ballads are founded on foreign originals, and constitute what some of the Russian critics are fond of calling the "inimitable imitations" of Zhukovsky. But how far the imitation extends it is not always easy to ascertain, for in most cases he takes the liberty of suppressing the name of the original."
Two children, both boys, were the sons of the mariner, and his chief delight was in superintending their education, which he wished that his life might be prolonged to his eightieth year to see completed. Neither this wish nor that of revisiting Russia was fulfilled. On the 12th of April 1832, Zhukovsky had died and resigned, at Baden, in the bosom of his family. His remains were afterwards removed to his native country.

An edition of Zhukovsky's works which appeared at St. Petersburg in 1833-37, fills eight octavo volumes, and is used as a common material for packing, and for stuffing cottager's cushions; it has also been used medicinally as a poultice.

ZOGA, River. (Aravia, S. 2.)

ZSCHOKKE, JOHANN HEINRICH DANIEL was born at Magdeburg in Prussia on March 22, 1771, and received the earlier part of his education in the Klosterschule and in the gymnasium of that town. When only seventeen he quitted his school and family, and became play-writer and troop of strolling-players. In a short time however he returned to his family, and was sent to the university of Frankfurt-on-the-Oder, where, without any settled plan, he studied philosophy, theology, the fine arts, history, and finance. In 1792 he commenced private life as a writer, while in the free state of Prussia he employed most of his time in writing for the stage, where his 'Aballino, the Bandit' (of which the story was borrowed by Monk Lewis for his 'Bravo of Venice'), and 'Julius von Sassen', produced at this period, were favourably received. Zhukovsky's works were all in favour of the principle of the humanity of respect for religion, and therefore when, in 1796, he applied for a professorship it was refused him. He then left Frankfurt, travelled about Germany and France, and at length settled at Reichenau in the Graubunden, where, in conjunction with Zellweger, he established a boarding-school for boys, which was so well conducted that the canton presented him with its freedom as a burgher, and he voiced his gratitude by writing his 'Geschichte der Freistaaten der drei Bünde in Rheinland' (History of the Free States of the Three Bünde in the Rhine). This work appeared in 1799. This is an account of the early associations of the canton for the establishment of its liberties, and was the precursor of several other works on the history of Switzerland. In that year however the Canton of Graubunden declined to join the Helvetic republic established by French influence; Zschokke was in favour of the union; he became unpopular, and his school was the sacrifice. Austrian troops entered the canton, and Zschokke withdrew to Aarburg, where he published a journal called 'Zur Alp', and the Helvetic republic was then fixed. His reputation, his talents, and his political opinions, procured him employment under the government. He was made chief of the department of education, and was sent in the capacity of a fully accredited commissioner to carry on the emancipation of Unterwalden, suffering from the devastations of a foreign enemy and the effects of party violence, where he acted as a true benefactor and a restorer of peace. A memorial of this remarkable period is given in his 'Historische Denkwiirdigkeit der Schweizerische Staatsenwaltung' (Historical Memoirs of the Swiss Revolution). His commission was subsequently extended over the cantons of Uri, Schwyz, and Zug, and his appeals for the help of the miserable sufferers remain in proof of his labours of aid and humanity. An excellent sketch, published in 1801. In 1801 the central government of the new nation appointed him to the 'Geschichte vom Kämpfe und Untergange der Schweizerische Berg- und Wald-cantone' (History of the Conflicts and Fall of the Swiss Mountain and Forest Cantons), an excellent sketch, published in 1801. In 1801 the central government of the new nation appointed him to the "Geschichte vom Kampfe und Untergange der Schweizerische Berg- und Wald-Cantone" (History of the Conflicts and Fall of the Swiss Mountain and Forest Cantons), an excellent sketch, published in 1801. governor of Basel, where a commotion had arisen against the land-tax and tithes; he there threw himself into the midst of an armed assemblage of the people, and induced them to follow his advice and submit. When the central government at Bern, with the Land-mann, Almighty God, became aware of his popularity, he retired to Biberstein in Aargau, to devote himself to his favourite studies. Much civil contention arose, and a civil war seemed inevitable, when in October 1802, Bonaparte offered his mediation, and by it the federal union of Switzerland was established in 1803. The modification brought Zschokke again into political activity. He was presented with the citizenship of Aargau, and nominated by the government in 1804 a member of the council of mines and forests. In the same year he commenced his popular ‘Schweizerboten’ (Swiss Messenger), and in 1807 his ‘Miscellen für die neueste Weltkunde’ (Miscellany of the most recent Events), which was continued without interruption till 1813; it displayed a happy choice of subjects, a richness of contents, a conscientious liberalism, and in general a strong and correct judgment. In 1814, when the Swiss after the downfall of Bonaparte, again wished to reconstruct their constitution, Zschokke exerted himself to maintain peace in Aargau, while he strenuously defended its independence against the claims of Bern. In 1820, in consequence of some imputations against him as editor of the ‘Schweizerboten,’ he resigned his office of church and forest inspector, but retained those of member of the council, of the school directory, and president of the directory of the school of education for artisans. In 1830 he was re-elected a member of the church council, and he continued to exert himself actively and effectively in the promotion of education and all social reforms, though his time was now chiefly given to literary composition. With these duties and his literary works, which became extremely numerous, he continued to occupy himself until his death, which took place at Biberstein, on June 27, 1848. His published works are of very varied character. We have noticed some of his historical and political productions, but in this class the most valuable are his ‘Geschichte des Bayerischen Volks und seiner Fürsten’ (History of the Bavarian People and their Princes), 1813-18; and ‘Das Schweizerlandes Geschichte für das Schweizervolk’ (History of Switzerland for the Swiss People), 1822; which are highly esteemed, have been frequently reprinted, and distinguished by a lucidity of arrangement, clearness of perception, a keen insight into character, and warmth and strength of expression; his novels and tales of mediocrity or other classes in number. Among the best are his ‘Adventures of a New Year’s Night,’ which was translated into ‘Blackwood’s Magazine,’ ‘Jonathan Fröck,’ a serio-comic novel, ‘The Dead Guest,’ and ‘The Goldmaker’s Village.’ His merits are a correct delineation of the nicer shades of character, a naturally simple pathos, a happy exposition of some of the weak points of our social institutions, a considerable amount of humour, and a constant maintenance of good principles and feelings. Some of these novels, like the ‘Cottagers of Glenburnie,’ aim at effecting the removal of social evils, national prejudices, or injurious customs, such as ‘Die Branntweinpest’ (The Brandy Pest); he is frequently tedious, and his plots are improbable, and the least happy of his attempts are of the historical class. His poetry seldom rises beyond mediocrity, nor are his dramatic attempts of a high character. He had much knowledge of a kind fitting him for his office of inspector of forests, and was acquainted with geology, particularly in reference to the country in which he resided, as is shown in his ‘Gebirgsförster’ and ‘Die Alpenwander.’ By far the most popular of his works was his ‘Stunden der Andacht’ (Hours of Devotion), which was first published as a Sunday periodical, and which has gone through forty editions; it is one of the most complete expositions of meditative rationalism, but its want of orthodoxy was held to be compensated by its fervid eloquence, and its zealous inculcation of every practical duty in all ranks. This work was not novel to be his till the appearance of his ‘Selbsethah,’ a sort of autobiography of a somewhat singular character, which has been translated into English. He published a collected edition of his historical writings, in 1830, in 16 volumes, and a selection of his novels and poems in 14 volumes, in 1847; but an edition of his collected works, in 1829, occupied 40 volumes. Many of his works have been translated into French; and in English we have his ‘Goldenthal,’ a tale; ‘Der Goldmachers dorf;’ ‘Love’s Stratagem,’ and other tales; ‘The History of Switzerland;’ a volume of select essays; and the ‘Stunden der Andacht,’ under the title of ‘Hours of Meditation and Reflection.’
